The Museum, A Laboratory for Empathy

Géraldine BRETAULT

Keynote Lecture

Museums and general practice share a common mission: to learn to see people in all their vulnerability in order to cure them better.

Museums and general medicine share a profound mission: to learn to observe and listen to human beings in all their vulnerability in order to care for them more effectively. Through its works, the museum establishes itself as a laboratory of the gaze—observing a Greek statue or a Géricault trains the eye just as a medical history shapes the act of listening. It also invites us to consider the body's autonomy as a subject, whether depicted in its rebellion (Delacroix), its pain (Kahlo), or its inner anguish (Munch). Finally, the museum possesses a genuine power of healing: Monet's Water Lilies or kintsugi remind us that a crack can become a work of art. Like the general practitioner, it protects, repairs, and cares—a logic of care that explains why some countries now prescribe actual museum prescriptions.

From IPCC Reports to the Waiting Room: Connecting Scientific Evidence, Public Policy, and Daily Primary Care Practice regarding Climate Change

Dr. Valérie MASSON-DELMOTTE

Keynote Lecture

Managing Patients with Multimorbidity in Primary Care

Dr. Harini SATHANAPALLY

Keynote Lecture

Managing patients living with multiple long-term conditions (MLTC) is amongst the foremost clinical challenges facing primary care services today. This talk will trace the development of this area as a research and clinical priority, and, drawing on landmark studies, explore key aspects to consider in the care of patients with MLTC, including continuity of care, patient priorities, treatment burden, and polypharmacy, along with reflecting on future directions for research and clinical practice.

Non-Pharmacological Interventions: From Research to Practice

Dr. Iveta NAGYOVA & Pr. Gregory NINOT

CONTROVERSIES

CMG collège de la médecine générale

Wonca World family doctors. Caring for people. EUROPE

Overcome

Is Evidence-Based Medicine Dead? An outdated model or still relevant?

Pr. Trisha GREENHALGH & Dr. Alexandre GOUVEIA

Controversy

Evidence-Based Medicine has long-shaped medical education and clinical practice. But does it still hold up against today's challenges? Critics argue it is too rigid, built on clinical trials that struggle to capture the full complexity of care: patient values, context, uncertainty, lived clinical experience. Advocates, on the other hand, remind us that EBM is not set in stone, it reinvents itself, keeps evolving, and remains an essential foundation for rigorous, informed practice.

Can General Practice be delegated?

Dr. Peter HOLDEN & Pr. Nicolas SENN

Controversy

The WONCA Europe Conference 2026, themed around "Liberty – Equity – Fraternity," will be much more than a scientific event: it will be a historic moment for our discipline, and a unique opportunity to reaffirm our central role in tomorrow's healthcare"…so says the publicity for this conference but within the provision of healthcare has egalité and fraternité gone too far both risking patient safety and the medical profession's standing? Physician substitution is rampant in some European countries and it is time to debate the issue.

Should doctors be active on social media?

Dr. Pierre de BREMOND d'ARS & Dr. Laure GEISLER

Controversy

Is the GP the doctor of the individual vs the doctor of the community?

Dr. Karolina GRIFFITHS & Pr. Jan De MAESENEER

Controversy

The GP stands at the crossroads between the individual and society. But where should the focus lie? On one side: individualised care, a deeply personal relationship — adapting to each patient's life goals and unique context. Research even suggests that trust in the healthcare system is shaped by the quality of that individual encounter. On the other: a broader vision of health, where GPs are key players in public health, integrated care, and planetary health. Two compelling visions — one practitioner. Where do you stand?

What is at the heart of general practice: compassion or clinical excellence?

Dr. Jan LUBOMSKI & Dr. Lisa ZANGARINI

Controversy

Will patients replace their GP with Artificial Intelligence?

Dr. Stéphanie SIDORKIEWICZ & Dr. Jean-François THEBAUT

Controversy

ID 12 - "Pump it ip!" Large-scale clinical simulation to strengthen first-responder skills in family doctors.

Elena KLUSOVA NOGUINÁ [(1)], Kyle Steven SMESTAD [(2)] , Sara ESTEVES ARAÚJO CORREIA [(3)], Miriam REY SEOANE [(4)], Dina SALKOVIC [(5)], Rabee KAZAN [(6)], Alberto KRAMER RAMOS [(7)], Ana PERAL MARTÍN [(8)], Inês PEREIRA [(9)], John ADIE [(10)]

(1) Samu061, Ibiza, Espagne,
(2) Kvam Municipality, Kvam, Norvège,
(3) Pac tui - sergas, Vigo, Espagne,
(4) Cuap Manso/ Ics Barcelona, Barcelona, Espagne,
(5) Sanitas, Rotterdam, Pays-Bas,
(6) Cap Rambla, Udmafic Mutua Terrassa, Barcelona, Espagne,
(7) Servicio Urgencias Hospital Clínico Universitario Virgen De La Arrixaca (huva), Murcia, Espagne,
(8) Centro De Salud Paseo Imperial. Semfyc, Madrid, Espagne,
(9) Chnp, Ettelbruck, Luxembourg,
(10) Forhealth, Sunshine Coast, Queensland, Australie

Context: Across Europe, family doctors often act as the first responders in the chain of survival—whether in clinics, during home visits, in public spaces, schools, rural areas or even on board aircraft. Yet recent European educational reviews show that 40–60% of family physicians feel insufficiently prepared to manage cardiac arrest, especially when more than 12–24 months have passed since their last BLS/CPR training. This workshop supports the mission of our responsibility to provide competent emergency care in every community through a large-scale simulation model specifically designed for family doctors.

Objectives: • Strengthen BLS skills, confidence and crisis leadership. • Promote rapid, structured reasoning in cardiac arrest and other emergencies. • Encourage effective teamwork and clear role allocation under pressure.

Teaching method and workshop: Method: A high-fidelity live simulation will be delivered for 250–350 participants using advanced audiovisual projection and rotating volunteer teams. The scenario will be broadcast in real time on a large screen, with participants interacting via the Mentimeter app to analyse decisions, vote on key actions and engage in mass participation with the educational depth. Schedule: • 5 min – Introduction: brief evidence-based CPR updates and key implications for primary care. • 13 min – "Pump It Up!" live scenario (basic life support): early recognition, activation of resources, high-quality compressions, AED use and leadership. • 13 min – Structured debrief (BLS case): practical tools, behavioral mnemonics ("Call – Ventilate – Compress") and strategies for use in daily practice • 13 min – Clinical simulation (intermediate life support case): focused scenario addressing airway support, rhythm recognition, medication management and coordinated team actions. • 13 min – Detailed debrief: reflection on performance, clinical reasoning and key actions applicable to real-world emergencies. • 3 min – Take-home tips and closing remarks.

Expected outcomes: Participants will gain more reliable BLS/CPR performance, improved decision-making under pressure, greater readiness to act and easy-to-apply tools in PC.

Conclusion: Every delegate at WONCA carries the responsibility—and the privilege—of being able to respond effectively to basic emergencies, regardless of setting. "Pump It Up!" offers a fresh, memorable pathway to that goal, helping family doctors proudly uphold their name and reputation.

ID 36 - Logical fallacy and cognitive bias challenge: understanding how our thinking shapes our care

Vineet NAIR

Schulich School Of Medicine & Dentistry At Western University, London, Canada

Context: Every day, family doctors make hundreds of decisions - from diagnosing illness to advising on new treatments. To do so, we rely not only on evidence, but also on intuition, pattern recognition, and experience. Yet, these shortcuts—while efficient—can also mislead us. Logical fallacies and cognitive biases shape how we interpret information, remember outcomes, and respond to patients. Understanding them is essential for better reasoning, communication, and care.

Methods: This interactive session explores the common cognitive biases and logical fallacies to which all humans are prone. A large grid will list frequent errors in thinking, and attendees then select which concept to "uncover," prompting a concise, case-based discussion. Each bias is defined, followed by a relevant clinical example. The format encourages humour, participation, and reflection, while reinforcing the key message: awareness of how we think can improve the accuracy of what we think and our confidence in the conclusions we make.

Originality: While critical thinking is central to evidence-based medicine, a formal review of cognitive biases and logical fallacies is rarely included as part of medical curriculums. This presentation transforms an abstract concept into an accessible learning experience. The format draws on adult learning principles—choice, relevance, and active engagement—to deepen understanding and retention.

Lessons learned and future implications: Seeing these biases illustrated through everyday clinical examples will help participants recognize their own blind spots and how to avoid them. Being aware of them allows us to see the world in a different light and can feel like a "super power," as we navigate a world continually trying to use them to their advantage to make us buy things or think a certain way.

Discussion: Awareness of cognitive bias and logical fallacies doesn't eliminate it—but it creates the space to pause, reflect, and choose better. That pause is the foundation of good judgment in family medicine, as we take the time to understand not just what we think but also why we think it.

Conclusion: By combining humour, participation, and real-world relevance, this session invites clinicians to think about their thinking—and rediscover the fascinating world of how our brains work.

ID 116 - World café "non-prescribing, deprescribing". What tools are available in Europe? What are the benefits for healthcare professionals?

Amelie RICHARD [(1)] , Louis HIDALGO-BACHS [(1)], Mickael BIGEAULT [(2)], Sarah CHATEAUNEUF [(1)], Candice DELBET-DUPAS [(3)], Elodie CHARUEL [(3)]

(1) Accept, Uca, Clermont Ferrand, France,
(2) Departement Medecine Generale, Clermont Ferrand, France,
(3) Hôpital, Vichy, France

Context: Deprescribing and non-prescribing are booming. European doctors have different deprescribing tools, which are rarely shared. In studies, doctors describe deprescribing as "swimming against the tide": difficult and time-consuming. Yet healthcare professionals are already under emotional, physical, and organizational pressure that is affecting their health.

Objectives: Share internationally scientifically validated tools for deprescribing and non-prescribing. Identify, if they exist, the benefits of deprescribing on the quality of life and health of healthcare workers.

Teaching method and workshop: The facilitators are experts in the topics of "deprescribing," "non-prescribing," and "combating caregiver burnout." The teaching is participatory in a world café format with three groups of 13 participants and three volunteer ambassadors. Each ambassador will be accompanied by an expert facilitator. The first ambassador will ask the question: What tools do you use to deprescribe? The second will ask: What techniques do you use to non-prescribe? The third will ask: What personal benefits do you see from non-prescribing and deprescribing? The three groups will discuss each question. Each ambassador will report back on the answers, highlighting equity between countries, the sharing of tools, and the human fulfillment of caregivers. SCHEDULE: Grouping by color code, 10-minute introduction (context, explanation of the World Café, selection of volunteers). The first round of group discussions lasts 15 minutes. In the second round, the time is reduced to 8 minutes because the facilitator and ambassador have presented a summary of the first round of discussions. The third round lasts 5 minutes. Each ambassador gives a 6-minute presentation, and the facilitators conclude in 5 minutes.

Expected outcomes: Acquire scientifically validated international deprescribing and non-prescribing tools and techniques, learn about the potential benefits of deprescribing and non-prescribing for the health and quality of life of healthcare professionals.

Conclusion: Promote equity and sharing in Europe of the tools available to caregivers for deprescribing and non-prescribing. Preserve physicians and emphasize the benefits for them, in order to ensure an efficient, sustainable, and humane healthcare system for the future.

ID 134 - Developing a Health-Promoting Primary Care Clinic

Lilach MALATSKEY [(1)] , Rosália PÁSCOA [(2)], Snežana KNEŽEVIĆ [(3)], Gökçe İŞCAN [(4)]

(1) Azrieli Faculty Of Medicine, Bar Ilan University, Zichron Yaakov, Israël,
(2) Faculdade De Medicina Da Up Ccsp, Porto, Portugal,

(3) University Of Kragujevac, Kragujevac, Serbie,
(4) Kütahya Health Sciences University, Kütahya, Türkiye

Context: Integrating Lifestyle Medicine (LM) into routine primary care remains a significant challenge. While patients often understand the benefits of healthy habits, translating this knowledge into sustained behavior change is difficult. Consequently, pharmacology often takes a predominant role in managing chronic diseases, despite robust evidence demonstrating that comprehensive lifestyle changes significantly reduce morbidity and mortality. This gap is further complicated by physician time constraints and lack of structured implementation strategies.

Objectives: This symposium aims to equip primary care physicians with a practical, step-by-step framework for transforming their practice into a Health-Promoting Clinic (HPC)—defined as a setting that actively facilitates healthy lifestyle behaviors for both its staff and patients. The objective is to provide attendees with a personalized methodology focused on phased implementation, team engagement, and measurable (SMART) goals.

Teaching method and workshop: Introduction (5 minutes): Defining the Health-Promoting Clinic (HPC) and setting the stage for cultural transformation in primary care. Expert Presentation (30 minutes): Detailed presentation of the four-phased HPC transformation framework, including real-world examples: Situational Analysis, Team Engagement, Prioritization & Planning, and Implementation & Sustainability. Small-Group Work (10 minutes): Participants will collaborate to discuss how to perform a rapid Situational Analysis and apply the SMART model to prioritize goals and outline an executable action plan for their own clinics. Discussion and Wrap-up (10 minutes): Group sharing of initial ideas, final questions, and distribution of resources for continued learning.

Expected outcomes: Attendees will be able to perform a rapid self-assessment of their current practice environment. They will gain tools for effective team engagement and champion recruitment and how to create a SMART action plan for initiating cultural transformation and embedding health promotion into their practice identity

Conclusion: Primary care physicians are uniquely positioned to lead robust lifestyle interventions. This session will provide attendees with the concrete tools, methods, and inspiration needed to initiate their own HPC transformation, ensuring that the commitment to health promotion is seamlessly embedded into the core identity of their clinical practice.

Corresponding author: Lilach Malatskey, lilach.malatskey@gmail.com

ID 147 - Approach to the Patient with Advanced Dementia in Primary Care: A Practical Workshop for Family Physicians

Nili ELIOR [(1)], Lior ZADA [(2)] , Yael LEVY [(2)]

(1) The Department Of Family Medicine, Clalit Health Services, Tel Aviv District; Tel Aviv University, Tel Aviv, Israël,
(2) The Department Of Family Medicine, Clalit Health Services, Tel Aviv District, Tel Aviv, Israël

Context: Advanced dementia presents complex clinical, ethical, and emotional challenges for family physicians. Many primary care clinicians feel unprepared to guide families through shared decision-making, end-of-life planning, and symptom management. This workshop, developed by geriatric and family medicine experts from Clalit Health Services (Tel Aviv district), provides practical tools for approaching patients and families with compassion, clarity, and confidence.

Objectives: Identify the main medical, ethical, and communication challenges in managing advanced dementia in the community. Apply structured approaches to align expectations and define care goals (“life-prolonging,” “comfort-focused,” or “middle path”). Practice communication techniques for discussing prognosis, swallowing difficulties, aspiration, pain, and feeding options. Integrate legal and ethical frameworks, for examle the Israeli Dying Patient Law and advance directives.

Teaching method and workshop: The 60-minute session combines a brief clinical case presentation, group discussion, and interactive polls (via Padlet) exploring participants’ experiences and dilemmas. Facilitators (geriatricians and family physicians) lead guided reflections and provide practical decision-support tools for real-world primary care settings. 10 min: Introduction and case presentation 20 min: Group discussion of clinical and ethical dilemmas 15 min: Practical framework for communication and medical decision-making 10 min: Application of tools to participants’ own cases 5 min: Summary and take-home messages.

Expected outcomes: Participants will leave with enhanced confidence in conducting family meetings, balancing comfort and longevity, and managing advanced dementia complications in the community. They will gain a practical algorithm for

"starting points" (knowledge gaps, family alignment, legal considerations) and tools to discuss aspiration, pain, and nutrition with empathy and evidence.

Conclusion: This workshop bridges geriatric expertise and primary care realities, promoting humanistic, evidence-based, and ethically sound dementia care within the community.

Corresponding author: Nili Elior, arielnili@gmail.com

ID 165 - Neighbourhood Health: A GP-Led Model for Integrated, Proactive, Person-Centred Care

Victoria BLAKE, Michael HOLMES, Emma OLANDJ, Daniel KIMBERLING, Zulf ALI, Simon MORRITT

Nimbuscare, York, Royaume-Uni

Context: Across the NHS and Europe, health systems are seeking new ways to strengthen primary care, reduce fragmentation, and address widening inequalities. A GP-led at scale provider has pioneered NHS England's 'Neighbourhood Health' model that brings together general practice, community services, mental health, social care, and the voluntary sector to work as one team around local populations. Grounded in the principles of prevention, integration and empowerment, the model offers a practical framework for translating population-health ambitions into daily general practice.

Objectives: Participants will: 1. Understand the core principles of Neighbourhood Health. 2. Explore approaches to building multidisciplinary teams around local populations. 3. Reflect on the GP's role as connector, facilitator and system integrator. 4. Identify transferable lessons and enablers for neighbourhood-based working. 5. Co-design local adaptations relevant to their own context.

Teaching method and workshop: 0–10 min: Introduction and framing – overview of the neighbourhood model and NHS policy context. 10–25 min: Small-group mapping of participants' local 'neighbourhood ecosystems' 25–40 min: Case discussion – Community Frailty Hub 40–55 min: Whole-group reflection on barriers, enablers, and transferable learning. 55–60 min: Closing summary and take-away toolkit.

Expected outcomes: articipants will gain practical insight into how Neighbourhood Health can be implemented within primary care, including mapping community assets, strengthening multidisciplinary collaboration, and initiating GP-led system integration.

Conclusion: Neighbourhood Health demonstrates how general practice can act as the integrator of local health and care systems—shifting focus from illness to prevention, from services to communities, and from fragmentation to shared purpose. The workshop offers actionable, evidence-based learning for clinicians, managers and policymakers seeking to build equitable, person-centred primary care across Europe.

Corresponding author: Michael Holmes, michael.holmes@nhs.net

ID 201 - Lifestyle Medicine and Sleep – Evidence, Interventions, and Health Impacts

Özden GÖKDEMIR [(1)], Snežana KNEŽEVIĆ [(2)] , Vilma KRIAUČIONIEN· [(3)]

(1) Izmir University Of Economics, Izmir, Türkiye,
(2) Academy Of Applied Studies Polytechnic, Serbia, Serbie,
(3) Department Of Preventive Medicine, Faculty Of Public Health, Lithuanian University Of Health Sciences, Lithuania, Lituanie

Context: Sleep complaints are common in family medicine, yet non-pharmaceutical interventions remain underutilized. This workshop equips family physicians with evidence-based Lifestyle Medicine tools to address sleep disorders through behavioral change. Research demonstrates that lifestyle interventions—encompassing physical activity, nutrition, stress management, and sleep hygiene—significantly improve sleep quality, reduce symptoms of insomnia, and decrease dependence on pharmacotherapy. Family physicians can offer holistic, sustainable solutions aligned with patient preferences.

Objectives: By the end of this session, participants will be able to: Synthesize evidence linking lifestyle factors (exercise, diet, stress) to sleep quality and sleep disorders. Counsel patients using evidence-based strategies across four domains: physical activity timing, dietary modifications, sleep hygiene protocols, and stress reduction techniques. Demonstrate motivational interviewing through live mindfulness exercises and patient-centered communication. Evaluate implementation barriers and develop feasible action plans adaptable to diverse patient contexts.

Teaching method and workshop: Interactive polling assesses current practice patterns. Evidence-

based mini-lectures present key findings with visual aids. Live demonstration includes a guided 5-minute mindfulness breathing exercise. Structured worksheets support action planning. Plenary discussion addresses implementation challenges in primary care settings. The workshop consists of a 60-minute core session, with an optional 15-minute Q&A extension. The session begins with an interactive introduction and polling on current sleep counseling practices, followed by an evidence synthesis that links lifestyle behaviors to sleep outcomes with clinical implications. The main segment covers four intervention pillars with practical applications: exercise prescription timing, dietary counseling strategies, sleep hygiene recommendations, and stress reduction techniques, culminating in a guided mindfulness demonstration. Participants then develop individualized action plans using structured worksheets before concluding with a summary and resource distribution. For those interested, an extended Q&A and case discussion period follows the main session.

Expected outcomes: Participants will integrate evidence-based sleep interventions into consultations, confidently prescribe non-pharmaceutical approaches, utilize structured counseling frameworks, and provide actionable strategies respecting individual circumstances and preferences.

Conclusion: Lifestyle Medicine transforms sleep counseling from symptom management to root-cause intervention. Family physicians who master these evidence-based behavioral tools can offer patients sustainable, empowering alternatives to medication-first approaches.

Corresponding author: Özden Gökdemir, gokdemirozden@gmail.com

ID 208 - Motivational interviewing in family medicine: From understanding to empowering behavioral change

Raisa ÁLVAREZ PANIAGUA [(1)] , Helena ALONSO VALENCIA [(2)], Charlotte MORRIS [(3)], Paula SALA IBARS [(4)], Seyma HANDAN AKYON [(5)]

(1) Seris, cervera Del Río Alhama, Espagne,
(2) Eyfdm, Newquay, Royaume-Uni,
(3) University Of Manchester, Manchester, Royaume-Uni,
(4) University Of Valencia, Valencia, Espagne, (5) Sincan Education And Research Hospital, Ankara, Türkiye

Context: Motivational interviewing (MI) is a collaborative and person-centered communication method designed to enhance intrinsic motivation for behavior change. In family medicine, MI can be applied to a wide range of consultations—from managing chronic diseases to preventive care and lifestyle counseling. Despite its proven effectiveness, many family doctors and trainees report limited formal training and confidence in applying MI techniques during busy consultations. This workshop aims to bridge that gap by offering interactive learning, reflection, and practical skill-building tailored to the realities of primary care.

Objectives: By the end of the workshop, participants will be able to: -Describe the principles and spirit of motivational interviewing. -Recognize opportunities to use MI during family medicine consultations. -Apply core MI techniques (OARS: open questions, affirmations, reflections, summaries) in simulated clinical situations. -Reflect on personal communication style and barriers to implementing MI in daily practice.

Teaching method and workshop: The session will be highly interactive, combining brief theoretical input, small-group exercises, live demonstrations, and role-play scenarios based on real-life cases. Facilitators will guide participants through practice activities and provide immediate feedback. Workshop schedule (60 minutes) 0–10 min: Introduction to MI principles and evidence base 10–20 min: Demonstration of MI in a clinical encounter 20–45 min: Small-group role-play and feedback 45–55 min: Group reflection and strategies for integration into practice 55–60 min: Summary and take-home messages.

Expected outcomes: Participants will leave the workshop with practical communication tools to enhance patient engagement and promote sustainable behavior change. They will gain increased confidence in applying MI strategies during lifestyle counseling, chronic disease management, and preventive care encounters.

Conclusion: Motivational interviewing offers family physicians a structured yet flexible approach to foster patient-centered care and behavioral change. This workshop will empower participants to integrate MI techniques into routine consultations, improving both patient outcomes and professional satisfaction.

ID 209 - Enhancing dermoscopy skills in primary care: A practical and interactive workshop

Raisa ÁLVAREZ PANIAGUA [1] , Dragos-Paul HAGIU [2], Anneliese WILLEMS [3], Raquel GRACIA RODRÍGUEZ [4], Ana PERAL MARTÍN [5], Mary John-Charles ROBERTSON [6], Rabee KAZAN [7], Cheryl YUEN CHING [8], Rocío GARCÍA-GUTIÉRREZ GÓMEZ [9]

(1) Servicio Riojano De Salud, Cervera Del Río Alhama, Espagne,
(2) Université Jean Monnet, Faculté De Médecins Jacques De Saint-Etienne, Saint-Priest-En-Jarez, France,
(3) University Of Melbourne, Melburne, Australie,
(4) U.g.c. Bujalance, Córdoba, Espagne,
(5) Centro De Salud Paseo Imperial, Madrid, Royaume-Uni,
(6) Gloucestershire Hospitals Nhs Foundation Trust, Gloucestershire, Royaume-Uni,
(7) cap Rambla Terrassa, Barcelona, Espagne,
(8) Cuhk Medical Centre, Hong-Kong, Chine,
(9) Hospital Universitario Severo Ochoa, Madrid, Espagne

Context: Skin lesions are among the most common reasons for consultation in primary care. With the global rise of melanoma and non-melanoma skin cancers, early detection is essential for improving outcomes. Dermoscopy has proven to be a cost-effective diagnostic tool that increases recognition of suspicious lesions and reduces unnecessary referrals. Evidence shows that its use in primary care can raise diagnostic accuracy for melanoma up to fifteenfold, highlighting its value for family physicians. However, many general practitioners still lack access to structured training. This workshop addresses this gap through hands-on learning focused on practical interpretation and clinical reasoning in daily practice.

Objectives: By the end of the session, participants will be able to: -Identify key dermoscopic structures and patterns. -Apply basic diagnostic algorithms to distinguish benign from malignant lesions. -Recognize common dermatoscopic findings in primary care. -Gain confidence in using dermoscopy as a triage and diagnostic tool.

Teaching method and workshop: The session combines short theoretical input with active, case-based learning. Participants will receive a visual reference flyer. Interactive activities include image-based exercises, case discussions, and short digital quizzes (e.g., Kahoot) to reinforce learning. The workshop follows the Kirkpatrick evaluation framework, addressing engagement, learning, behavior change, and clinical outcomes. Workshop schedule (60 minutes) 0–10 min: Introduction and overview 10–30 min: Interactive presentation of diagnostic structures and algorithms 30–50 min: Case discussions and image-based exercises 50–60 min: Kahoot quiz, summary, and Q&A.

Expected outcomes: Participants will acquire practical dermoscopy skills for earlier detection of skin cancer and improved triage. Applying the Kirkpatrick model, this workshop seeks measurable improvements in both learning and clinical practice.

Conclusion: Dermoscopy enables family physicians to make timely, evidence-based decisions in skin lesion management. Using the Kirkpatrick model for structured learning, this workshop—organized by the WONCA SIG on Dermatology—offers an engaging and reproducible format to enhance diagnostic accuracy and patient safety in primary care.

ID 219 - Co-designing an online pathway for patients to report cancer symptoms

Benedict HAYHOE [1] , Rosalind ADAM [2], Geva GREENFIELD [1], Helen ATHERTON [3], Ana Luisa NEVES [1]

(1) Imperial College London, London, Royaume-Uni,
(2) University Of Aberdeen, Aberdeen, Royaume-Uni,
(3) University Of Southampton, Southampton, Royaume-Uni

Context: Cancer incidence is rising, particularly in younger adults. However, survival rates vary significantly by country. A key reason for these disparities is delay in diagnosing and treating cancer, particularly in early stages. Online consultations between patients and GPs may help reduce delays, and some people may find it easier to ask about cancer online. However, there is no specific online form in GP systems for people worried they may have cancer. Furthermore, we do not know if this will help find cancer earlier, or if it will have unintended effects, like increasing GP workload. We are developing a patient-facing online consultation template for people worried about cancer. This will help identify and clarify concerns, facilitating more timely cancer referral and specialist assessment, or appropriate reassurance.

Objectives: To introduce participants to the use of online consultations for communication and triage in primary care; To consider the relevance and impact of a 'cancer concerns' online consultation template, including possible benefits, unintended consequences, and implications of adoption across different health systems; To contribute to the co-

design of an online consultation template for use by patients.

Teaching method and workshop: This multi-country, mixed-methods, co-design workshop will involve a quantitative survey with live feedback (using Mentimeter), as well as large group discussion, and small focus group approaches. Workshop schedule Introduction to online consultations and context; (5min) Online survey on potential for a 'cancer concerns' online consultation pathway; (10min) In-depth whole group discussion of potential impact on patients and clinicians; (20min) Presentation of draft online template; (5min) Small group discussion and template refinement; (15min) Whole group feedback.(5min)

Expected outcomes: Participants will gain insight into use of online consultations, and contribute, through discussion of key symptoms relevant to cancer concerns, to development of a template to support patients' more timely access to triage and assessment.

Conclusion: With online consultations becoming a routine part of general practice, now is the right time to explore how they can be used to help find and treat cancer earlier. Through this novel pathway, we may be able to reduce delays and improve survival.

ID 230 - SonoChallenge

Isabelle CIBOIS-HONNORAT [(1)] , Baptiste CHAUVIN [(2)], David DE BANDT [(3)], Laurent AUBERTIN [(4)]

(1) Snecho-Mg, Mirabeau, France,
(2) Snecho-Mg, Conches En Ouche, France,
(3) Snecho-Mg, Saint Nom La Breteche, France,
(4) Snecho-Mg, Angers, France

Context: Point-of-care ultrasound (POCUS) is becoming an essential tool in primary care, yet many general practitioners (GPs) still feel uncertain about its daily use. Traditional workshops often emphasize technique rather than reasoning, teamwork, and clinical integration. The SonoChallenge introduces an innovative, playful approach to learning ultrasound, inspired by medical game shows. It combines evidence-based practice, collaboration, and competition to strengthen skills and confidence among GPs. The workshop follows a preliminary online escape game that selects six finalists. These six participants, divided into two teams of three, compete live during the SonoChallenge session.

Objectives: By the end of the workshop, participants will be able to: Improve image acquisition and interpretation in common primary care situations. Apply ultrasound findings to clinical decision-making. Communicate and collaborate efficiently in team-based challenges. Explore innovative and engaging methods for teaching ultrasound.

Teaching method and workshop: The SonoChallenge is structured as a friendly competition between two teams. Facilitators guide the activities, ensure safety, and conduct short debriefings after each round. The six challenges are: Find & Freeze: obtain the best possible image of a requested organ, as quickly as possible. Blind Probe: one blindfolded operator guided verbally by teammates. Rapid Quiz: interpret ultrasound scans and propose diagnoses. Do It Again: reproduce a displayed scan sequence. One Study, 3 Minutes: summarize and present an ultrasound-related study. My Best Tips & Tricks: share practical advice with peers.

Expected outcomes: Participants will gain hands-on confidence in POCUS, develop teamwork and communication skills, and discover creative ways to integrate gamified ultrasound learning into primary care education.

Conclusion: The SonoChallenge turns ultrasound training into an engaging, evidence-based competition that enhances clinical reasoning, collaboration, and joy in learning.

ID 257 - Period(s): the game. Everything you wanted to know and you didn't dare to ask.

Helena ALONSO VALENCIA [(1)], Raisa ÁLVAREZ PANIAGUA [(2)] , Paula SALA IVARS [(3)], Miriam REY SEOANE [(4)], Catarina DE ATAÍDE SANTANA [(5)]

(1) Eyfdm, Newquay, Royaume-Uni,
(2) Seris, Cervera Del Río Alhama, Espagne,
(3) Eyfdm, València, Espagne,
(4) Cuap Manso/ Ics Barcelona, Barcelona, Espagne,
(5) Sesaram Epe, Funchal, Portugal

Context: Secretory, follicular, luteal phase… Does it sound familiar? When was the last time you had an update about the menstrual cycle? We all know it is a physiological event that occurs to half of the world population. However, due to its historical taboo, the knowledge sharing has been limited and focused on old beliefs. In addition, there has been a significant

increase of information shared in social media in the last few years, not only about menstruation but also other conditions related to the phenomenon.

Objectives: The healthy menstrual cycle and how to support it. Signs and symptoms of possible problems. Misconceptions and taboos about physiology and related behaviours.

Teaching method and workshop: We will use a goose game type with 28 squares, mimicking the theoretical 28 days of the cycle. Participants will be divided in groups and work with their own game board to facilitate everyone's participation. By moving between squares, attendees will respond to questions about different topics (nutrition, mental health, physical activity or health conditions related). Information will be explained after their answer about each phase of the cycle to learn more in depth. Some squares are for wild cards and "pictionary" type questions, to engage the participants into a highly dynamic way of learning. Workshop schedule Participants will be explained the rules in a brief introduction, and then they will take an active role by playing in the session. Presenters will facilitate active participation in the game during this session, and resolve any questions or doubts.

Expected outcomes: We wish the attendees to learn evidence-based concepts about the menstrual and ovarian cycles, as well as concepts related in sociology, nutrition and history, in a playful and dynamic setting.

Conclusion: We want to encourage everyone to come and participate actively, to help their patients and communities into having a better understanding. Knowledge is power!

ID 436 - Teaching cultural competence to health care providers

Fauzia AKHTAR [(1)] , Tabinda ASHFAQ [(1)], Areeba AKHTAR [(2)]

(1) Aga Khan University, Karachi, Pakistan,
(2) Liaqat National Medical College, Karachi, Pakistan

Context: With increasing global migration, physicians face challenges in delivering effective care to patients from various cultural backgrounds. To provide holistic care, the physicians must be equipped to provide respectful and appropriate care for their culturally and linguistically diverse patients. This workshop aims to empower healthcare workers with the skills to navigate cultural differences and enhance their ability to provide inclusive, patient-centered care.

Objectives: Effectively communicate with patients from diverse cultural backgrounds. Develop skills to provide care that respects and integrates the cultural, religious, and social factors that may influence a patient's health beliefs and behaviors. Recognize and address health disparities related to race, ethnicity, socioeconomic status, etc., to promote more equitable healthcare outcomes. Equip participants to create an inclusive and respectful environment where cultural differences are acknowledged and embraced, fostering improved trust and cooperation.

Teaching method and workshop: Welcome and introductions Brief overview of workshop objectives and outcomes Understanding Cultural Competence Role Plays Summarization and Closing Remarks

Expected outcomes: Improve cultural self-awareness Use culturally sensitive communication techniques Adapt care plans to align with patients' cultural values Manage cultural misunderstandings in clinical encounters Create an inclusive and culturally safe care environment.

Conclusion: This workshop aims to equip healthcare providers with the knowledge and skills to enhance cultural competence in their practice, fostering better communication, trust, and understanding with patients from diverse backgrounds. By understanding and respecting cultural differences, physicians are better equipped to make decisions that are in line with the patient's values, leading to better adherence to treatment and overall health outcomes.

ID 446 - CardioMetabolicRenal (CMR) Disease – Why call it CMR and what can we do in prevention of the world's most important cause of disability and early death?

Richard HOBBS [(1)], Raj THAKKAR [(2)], Nick JONES [(1)], Kamlesh KHUNTI [(3)]

(1) University Of Oxford, Oxford, Royaume-Uni,
(2) Pccs, Bourne End, Royaume-Uni,
(3) University Of Leicester, Leicester, Royaume-Uni

Context: CardioMetabolicRenal (CMR) Disease Symposium – Why call it CMR and what can we do in prevention of the world's most important cause

of disability and early death? Background The most important cause of death, and crucially premature death, in most countries are events secondary to cardio-metabolic-renal disease (CMR). Further, CMR is the main cause of major disability and therefore health and social care expenditure as well as reduced quality of life for patients and families. Fortunately, CMR has the largest evidence base in medicine and is the focus for much innovation in healthcare interventions given the importance of CMR disease to health systems. However, unfortunately, Health systems are failing to effectively implement prevention strategies in CMR such as better identify and mitigate the common risk factors that drive CMR disease. And this is despite the WHO's priority call for increased focus on disease prevention and long-term condition (LTC) management. Introduction Professor Richard Hobbs, University of Oxford & European PC Cardiovascular Society 1) Why has managing Chronic Kidney Disease (CKD) become more important? 15 mins Professor Raj Thakkar, GP Specialist in CVD, Primary Care Cardiovascular Society, United Kingdom 2) What are the key changes in guidance for blood pressure and lipid PC management? 15 mins Dr Nicholas Jones, University of Oxford & EPCCS 3) Is there a role for primary care in Obesity management? 15mins Professor Kamlesh Khunti, University of Leicester& PCDE Moderated panel and audience discussion 15 mins Professor Richard Hobbs

Objectives: 1) update on the most recent evidence for CMR 2) explore the optons for better diagnoses of CMR 3) discuss the management options to reduce the risk and nburden of CMR 4) answer queries on CMR and discuss areas of controversy.

Teaching method and workshop: Interative lecture sessions and moderated Q&A.

Expected outcomes: New knowledge; Better understandings; Practical guidance, leading to; Improved patient care.

Conclusion: CMR disease - the most important cause of death and disability and major work impact on promary care deserves an update session.

ID 451 - Preventing Loss of Autonomy in Primary Care: A Workshop on Implementing the WHO ICOPE Program

Antoine CABROL [(1)] , Catherine TAKEDA [(2)], Florence DURRIEU [(1)], Julie DUPOUY [(1)], Bruno CHICOULAA [(1)]

(1) Department Of Family Medicine, Toulouse, France, (2) I.h.u Healthage & W.h.o. Collaborative Center For Frailty, Clinical Research & Geroscience, And Geriatric Training, Toulouse University Hospital, Toulouse, France

Context: Since 2017, the WHO's Integrated Care for Older People (ICOPE) program has promoted a comprehensive approach to healthy aging. With a strong focus on prevention, it aims to preserve intrinsic capacities (mobility, cognition, nutrition, mood, vision, and hearing) in adults aged 60 years and older. Structured into five steps (screening, comprehensive assessment, personalized care planning, follow-up, and community engagement), ICOPE supports clinically meaningful stratification of frailty and functional limitations. Implemented six years ago in the Occitanie region and currently undergoing national piloting in France, the program places primary care and particularly multidisciplinary primary care practices at the forefront. However, organizational barriers persist, notably in the co-construction of personalized care plans, interprofessional coordination, and longitudinal follow-up.

Objectives: - Identify key components for a seamless ICOPE pathway: interprofessional communication, co-construction of care plans, and follow-up. - Share regional implementation experiences, including lessons from Occitanie. - Identify opportunities and barriers for each theme. - Co-develop transferable strategies to strengthen ICOPE implementation across diverse settings.

Teaching method and workshop: The workshop adopts a collaborative and participatory design, combining real-time polling (Wooclap), small-group work to identify barriers and opportunities across themes, and plenary synthesis : 1. Introduction and interactive overview of ICOPE, followed by presentation of implementation lessons from Occitanie (10 min). 2. Three thematic group discussions (15 min each), each followed by a plenary feedback session (10 min each): - Interprofessional communication - Co-construction of personalized care plans - Follow-up and longitudinal evaluation 3. Final synthesis and outlook (5 min).

Expected outcomes: Participants are expected to gain an improved understanding of organizational challenges related to ICOPE implementation in primary care. They will identify transferable lessons from regional experiences and contribute to a collective synthesis of actionable strategies and levers to support broader integration.

Conclusion: This workshop is grounded in peer learning on integrating ICOPE, a WHO program designed to prevent loss of autonomy in adults aged 60 years and older, into primary care. It seeks to support wider adoption, uptake and specific adaptation of the program across participants' regions.

Corresponding author: Antoine Cabrol, antoine.cabrol@dumg-toulouse.fr

ID 481 - Emotional Competence in General Practice : A Practical Workshop for Everyday Clinical Application

Antoine CABROL, Alix FERNET-SCHERER, Melissa LHERMINE, Lisa OUANHNON, Emile ESCOURROU

Department Of Family Medicine, Toulouse, France

Context: General practitioners (GPs) encounter diverse and challenging situations that evoke emotional responses. When emotions become overwhelming, they may negatively affect the doctor–patient relationship, contribute to professional burnout and affect personal life. Given these challenges, GPs need to develop adaptive emotional coping strategies relevant to their daily practice. However, emotional skills remain insufficiently addressed in medical training. Promoting their development is essential both to support clinical practice and to facilitate their integration into medical education. According to Mikolajczak, emotional competence encompasses five key dimensions: identification, understanding, expression, regulation, and utilization.

Objectives: This workshop aims to strengthen GPs' emotional skills by helping participants develop personal and effective coping strategies. It also seeks to raise awareness of emotional dynamics in the patient-care relationship, highlight clinical scenarios at risk of emotional overload, and explore the determinants of physicians' emotional reactions.

Teaching method and workshop: The workshop uses an active, experiential, and reflective approach structured in chronological steps: 1. Facilitators open with clinical narratives to introduce key concepts, followed by co-creation of group rules. 2. Participants engage in small-group discussions to explore significant emotional experiences and the factors influencing them. 3. Collective exercises promote reflection and sharing on the intensity of emotional expression in clinical situations. 4. Group work on coping strategies uses the Brief COPE toolkit, with discussion of the benefits and limitations of each strategy. 5. The workshop concludes with a discussion on acquiring emotional competence and the presentation of a practical toolbox. Each phase is enriched by plenary discussions and targeted theoretical input, following key steps of the emotional competence pathway: identification, understanding, expression, and regulation.

Expected outcomes: This workshop is expected to help participants acknowledge the legitimacy of emotions in general practice, understand how emotional experiences can spill over into personal and family life, and reflect on coping strategies to support emotional competence in daily clinical practice.

Conclusion: This workshop is designed to foster emotional competence in GPs, supporting the development of effective coping strategies in daily practice. This type of workshop may help prevent GP burnout and promote the doctor–patient relationship, with potential benefits for both practitioners and their patients.

ID 536 - From Heart to Data: Balancing Feelings, Evidence, and Artificial Intelligence (A I) in 2026 for medical decisions

Jean-Claude LENERS [(1)] , Raquel GOMEZ BRAVO [(2)], Monique AUBART [(3)], Marie BARTH [(4)], Patrick TABOURING [(5)], Ana Luisa NEVES [(6)], Liliana LARANJO [(7)], Steven VAN DE VIJVER [(8)]

(1) Gp Geriatrics Palliative Medicine, Ettelbruck, Luxembourg,
(2) Gp, Centre Hospitalier Neuropsychiatrique 17 Avenue Des Alliés L-9012, Ettelbruck, Luxembourg,
(3) Gp, Soc Sci Lux Med Gen, Frisange, Luxembourg,
(4) Gp, Soc Sci Lux Med Gen, Capellen, Luxembourg,
(5) Gp Psychotherapist Uni Lux, Luxembourg, Luxembourg,
(6) Gp Dept Of Primary Care & Public Health, Imperial College London, London, Royaume-Uni,
(7) Gp Sydney Medical School, University Of Sydney, Sydney, Australie,
(8) Gp Dept Of Primary Care Olvg, Amsterdam And Health&technology Institute, Amsterdam, Pays-Bas

Context: As it seems obvious that Artificial Intelligence (AI) will suggest the best options for diagnoses and treatments, should we still continue to trust in our own feelings coupled with evidence based documentation? Patient's expectations and beliefs must also be recognized and acknowledged .

Objectives: The GP should know at the end , how trustful , useful, or limited AI , feelings and our knowledge are in our daily GP practice. The GP should similarly understand the importance of feelings and patient related outcome-measures (PROMs) , if they are to adopt and support treatment proposals in mutualconside ration.

Teaching method and workshop: Teaching method: In smaller groups , three subtopics should be debated under the aspect of feelings and knowledge supported or not by AI: a) Considering different cultural backgrounds of patients and doctors , can equity in our decision making be supported by both feelings and knowledge? b) In ethical consultations for acute or palliative care, can feelings and knowledge or beliefs help us to shape the patient's and doctor's autonomy or liberty to decide ? c) Can feelings, even gut feelings in comparison to the patient's expectations and Proms bring us to a rational decision (with or without AI) in this fraternal patient-doctor relationship? Workshop schedule: After a short introduction to the terms feelings, clinical reasoning and AI in medicine, 3 rounds of 12 minutes will debate in a contradictory manner on the 3 subtopics and colleagues will report briefly for 2 minutes after each round. The authors of the WS will summarize the differences and agreements and a final general questioning will try to weigh feelings, knowledge, and AI together.

Expected outcomes: The participants, through interactive group discussions, should stimulate their own critical self-reflexion and give space to uncertainty, complexity, flexibility, intuitive assessment and open communication in order to come to the best possible medical decisions.

Conclusion: In rapidly changing times, becoming more aware of technical options and our own and patients reactions could help us to get more liberty in our daily medical decisions. 3 key words: emotions evidence-based artificial intelliegence.

ID 554 - PCDE Workshop on Chronic Kidney Disease: A step-by-step, evidence-based, practical approach in primary care

Waqas TAHIR [(1)], Pinar TOPSEVER [(2)] , Samuel SEIDU [(3)]

(1) Affinity Care, Bradford, Royaume-Uni,
(2) Acibadem University, Istanbul, Türkiye,
(3) University Of Leicester, Leicester, Royaume-Uni

Context: Patients with chronic kidney disease (CKD) and type 2 diabetes (T2D) are at high risk of CKD progression and cardiovascular (CV) disease. Prevalence of CKD in patients with T2D is currently around 40% and continues to grow. The cardio-renal axis represents the complex interplay between the heart and kidneys, two vital organs that are intricately linked in maintaining homeostasis. Management of CKD in patients with T2D aims to preserve kidney function to reduce the risk of end-stage kidney disease, CV events, and mortality. Most of this early detection and intensive management occurs within primary care.

Objectives: Delegates will gain a better understanding of the following: Why is CKD important – the cardio-renal-metabolic interplay Epidemiology of CKD Prevention and screening strategies of CKD Risk assessment in people with CKD Monitoring frequency and early management of CKD Delaying CKD progression and managing its complications When to refer to kidney specialists (including KFRE).

Teaching method and workshop: The format will be a face-to-face Workshop session , facilitated by 2-3 PCDE members with an expertise on CKD and CVD (cardiometabolism) Program outline Introduction of participants Kick-off presentation Grouping: 6 groups of max. 8 participants, each Presentation of clinical cases (one for each group) Group work Plenary session: group presentation of clinical management of cases Group discussion - using KDIGO PCDE one pager and Kidney-Failure Risk Equation (KFRE).

Expected outcomes: Improved clinical knowledge - CKD diagnosis, staging and progression Better Screnning and Early detection practices : high-risk groups Increased condfidence in management - pillar approach Enhanced care coordination : When to refer , care pathways Evaluation outcomes: Pre/post knowledge scores , commitment-to-change statements and adoption of tools taught in workshop.

Conclusion: The CKD primary care workshop improves clinicians' knowledge and confidence in the early detection, staging, and management of chronic kidney disease, emphasizing the critical role of primary care in slowing disease progression. Participants gain practical skills in interpreting eGFR and ACR results, initiating evidence-based therapies, and providing patient-centered education, while also strengthening understanding of referral pathways and interdisciplinary coordination. Overall, the workshop supports meaningful practice enhancements that promote

earlier intervention and better long-term outcomes for patients with or at risk of CKD.

ID 556 - Does family medicine embody the ideals of liberté, egalité, and fraternité for people with a history of migration?

Charlotte MORRIS [1] , Marwa AHMED [2], Catarina GOMES MADEIRA [3], Kerry GREENAN [4], Aaron POPPLETON [5], Rita ABECASIS [6], Maria Mallart RAVENTOS [7], Umber KHAN [8], Rebecca FARRINGTON [9]

(1) The University Of Manchester, Manchester, Royaume-Uni,
(2) Primary Care Corporation, Qatar, Qatar,
(3) Escola Nacional De Saude Publica, Lisbon, Portugal,
(4) Bromley-By-Bow Health Partnership, London, Royaume-Uni,
(5) Keele University/wonca Europe, Keele, Royaume-Uni,
(6) Primary Health Care Area, Unidade De Saúde Familiar Da Baixa,, Lisbon, Portugal,
(7) Institut Assistencia Sanitaria, Girona, Espagne,
(8) Shirley Health Partnership, Southampton, Royaume-Uni,
(9) Edge Hill University, Edge Hill, Royaume-Uni

Context: The philosophy of family medicine, comprehensive, continuous, and equitable care, is undermined by systemic challenges for people with a history of migration, both patients and clinicians. Health and well-being are compromised by societal forces, including legal status precarity, the impact of trauma, and a "hostile environment" within host countries. These create barriers in primary care, demanding that professionals critically assess the gap between the ideal of universal care and the reality of service provision.

Objectives: 1) To analyse the impact of current societal policies and structural barriers on health. 2) To examine access disparities, including the two-tiered system of provision and clinical blind-spots regarding global health conditions. 3) To develop strategies to foster solidarity, address discrimination against healthcare professionals with a migration background.

Teaching method and workshop: The workshop will start with a presentation and followed by concurrent, focused group discussions. Participants will select one of the three parallel discussion groups: Liberté (Freedom): Exploring hostile environments as a public health crisis and pathways to dismantling policies that prioritize enforcement over human dignity. Égalité (Equity): Focusing on access to healthcare, structural limitations (e.g., charging, lack of interpreting), and the imperative for comprehensive, culturally informed clinical care. Neglected diseases (e.g., Chagas disease, schistosomiasis) will be considered. Fraternité (Solidarity): Centred on addressing challenges faced by colleagues in family medicine with a migration history (credentialing, discrimination); strategies for professional self-care and resilience. Schedule: Presentation (10 minutes): Detailing societal, structural, physical, and mental health barriers for migrants. Concurrent Group Discussions (40 minutes): (Liberté (Hostile Environment); Égalité (Access to Care); Fraternité (Workforce Support)) Synthesis/Conclusion: (10 minutes) sharing and commitment to actionable solutions.

Expected outcomes: After attending the workshop, participants will be able to: Identify the toll of systemic barriers on health (Liberté). Challenge two-tiered systems of care and advocate for resources (Égalité). Implement strategies for supporting colleagues with a history of migration and fostering self-care to combat burnout (Fraternité).

Conclusion: By framing the systemic compromise of migrant health through the ideals of Liberté, Égalité, et Fraternité, this workshop provides family medicine professionals with the critical perspective and collaborative tools needed to transition from merely recognising health inequities to becoming advocates of comprehensive care.

Corresponding author: Charlotte Morris, charlotte.morris-3@manchester.ac.uk

ID 587 - Social Determinants of Health in Primary Care: What Can GPs Actually Do?

Trevor THOMPSON, Emily CANT, Monib SEDIQI

Bristol Medical School, Bristol, Royaume-Uni

Context: Humanism, defined as clinically excellent care that is kind, safe, and trustworthy, is fundamental to effective primary care (PC). High quality communication transforms clinically competent consultations into truly humanistic encounters. Yet opportunities for learners to practise real-world communication skills and receive feedback is educationally resource-intensive. AI-generated simulation offers a completely new way of approaching communication skills that is easily accessible and flexible. One such framework, currently in development, is COGConnect. Though AI-driven, COGConnect focuses squarely on trust building, psychological safety and patient centredness. Drawing on COGConnect, this workshop introduces PC

professionals to AI-supported communication training, as a innovative new way to inspire holistic consulting in Primary Care.

Objectives: 1. Describe how AI simulations can support the development of humanistic communication. 2. Apply prompt-engineering techniques to create (your own) novel consultation scenarios for simulation. 3. Understand the potential of AI systems to provide tailored and granular learner feedback. 4. Understand the particular contribution of COGConnect to communication skills pedagogy.

Teaching method and workshop: The workshop uses mixed, interactive methods: Concept walk: participants are given concept cards and asked to circulate exchanging interpretations of the concepts to activate prior knowledge and prepare for collaborative learning. [doi.org/10.1111/medu.12688] Demonstration: of an AI-generated clinical communication simulation and feedback. Skill-building session: how to create your own simulated consultation using ChatGPT. Debate: agreeing key phases of a well rounded consultation that we wish students to learn. Presentation: introducing the COGConnect platform - integrating AI simulation with humanism.

Expected outcomes: By attending this workshop you will: - Gain practical insight into AI-generated simulation - Understand AIs potential to deliver tailored feedback - Develope your ability to create your own AI simulations using ChatGPT - Gather awareness of the COGConnect consultation toolkit - Have your mind opened to a new way of commskills learning.

Conclusion: AI is rapidly becoming an integral element of medical education. This workshop mixes didactic and interactive learning approaches to help attendees grasp the extraordinary potential of AI simulation closely linked to an innovative and humanistic training toolkit (COGConnect). The workshop is recommended for anyone generally curious about AI and particularly those involved in any aspect of consultations skills training.

ID 588 - Access to (digital) healthcare is a human right. How can you reduce digital literacy in your healthcare organisation?

Esther METTING, Wieke BOUWES, Giovanni TELUSSA, Olivia LIN

University Of Groningen, University Medical Center Groningen, Groningen, Pays-Bas

Context: Digital healthcare is becoming increasingly essential as staff shortages and rising numbers of people with chronic conditions put pressure on healthcare systems. Innovations such as telemonitoring, video consultations, and digital self-management tools can support more efficient care. Yet around a quarter of European citizens lack sufficient digital skills to use these tools effectively. This challenge affects both patients and healthcare professionals and has major implications for accessibility and equity in care. More than ten years of research from our teams has shown that offering helpdesks or technical support alone is not enough: barriers differ widely between individuals and often require a personalised approach.

Objectives: This workshop helps participants understand the diversity of digital barriers among patients and professionals. It aims to equip them with practical strategies to tailor support to individual needs and guide people from precontemplation, not yet seeing the value of digital care, towards contemplation and engagement (based on the Stages of Chenge Theory, Prochaska et al). Participants will gain insight into why many digital illiterate individuals are not yet motivated to use digital tools and how thoughtful communication and adaptation can shift this mindset.

Teaching method and workshop: The session combines short evidence-based presentations with hands-on activities. Participants will explore common digital barriers, work with real-life examples, and identify suitable solutions. Interactive assignments encourage them to translate insights into practice: analysing user needs, adapting digital tools or communication strategies, and designing small changes that can immediately be implemented in their own organisation. Group discussions stimulate reflection and help participants learn from each other's experiences.

Expected outcomes: After the workshop, participants will feel more confident in recognising digital barriers and selecting appropriate solutions. They will understand why personalisation is essential and how to motivate users who are not yet ready to adopt digital healthcare. Participants will leave with practical ideas, concrete examples, and tools to support digital inclusion within their own professional context.

Conclusion: By gaining a deeper understanding of digital barriers and learning how to adapt support to

users' needs, participants can help make digital healthcare more accessible and equitable. This workshop empowers healthcare professionals to take meaningful steps toward truly inclusive digital care.

ID 598 - Bridging WONCA principles and European primary care: collaborative problem tree analysis

Laura KLINTSONE [(1)], Liena GASINA [(2)], Sabine MORA-MIEZE [(2)], Leonas VALIUS [(3)], Liga KAZLOVSKA [(2)], Jyothi PATRI [(4)] , Ilze GROPE [(2)]

(1) Rīga Stradiņš University, Health Center, Rīga, Lettonie,
(2) Rīga Stradiņš University, Rīga, Lettonie,
(3) Lithuanian University Of Health Sciences, Kaunas, Lituanie,
(4) Heritage Valley Health System – Family Medicine Residency Program, Beaver Fall, Pittsburgh, États-Unis

Context: Across Europe family physicians are committed to deliver care that is comprehensive, person-centered and rooted in professional autonomy, values reflected in WONCA. However, workforce shortages, administrative burdens, fragmented digital and referral systems impede delivery of equitable and relationship-based care. In partnership between Latvia, Lithuania and United States (USA), this workshop uses simplified problem tree analysis to collaboratively analyze how these challenges arise at micro (clinician), meso (practice/organizational) and macro (system) level and how they impact the daily capacity to uphold core values of fairness shared responsibility and meaningful clinical practice.

Objectives: Participants will be able to: - Identify specific gaps between Wonca principles and daily practice realities - Recognize micro, meso, and macro level barriers affecting equitable and relationship-based care - Construct a simplified problem tree mapping root causes and consequences of a selected barrier - Build a foundation for collaborative solution development for Workshop 2.

Teaching method and workshop: Facilitated small group activities guiding participants through clinical scenarios representative of diverse European primary care issues. Each group selects a scenario and constructs a succinct problem tree outlining contributing factors and consequences. A gallery walk enables peer review and shared learning. WORKSHOP SCHEDULE (60 minutes) - Introduction and scenario selection (8 minutes) - Small group problem tree construction (25 minutes) - Gallery walks and cross-group comparison (10 minutes) - Facilitated synthesis discussion (12 minutes) - Synthesis and transition to Workshop 2 (5 minutes)

Expected outcomes: - Creation of 4-6 problem trees identifying priority barriers in primary care - Enhanced skills in root cause analysis, applicable to quality improvement - Visual aids serving as starting point for solution generation in Workshop 2.

Conclusion: This workshop provides a structured, inclusive approach to analyzing primary care barriers fostering a shared understanding amongst participants. The collaborative process supports the development of actionable solutions that reflect the values of liberty, equality and fraternity, strengthening quality improvement efforts across European primary care.

ID 605 - Post graduate training experiences that shape reproductive health practice in family medicine: designing training that sticks

Risa GRIFFIN [(1)], Maria PORTELA [(1)] , Viviana MARTINEZ BIANCHI [(2)], Julia STRASSER [(1)], Qian LUO [(1)], Ellen SCHENK [(3)]

(1) George Washington University, Washington, Dc, États-Unis,
(2) Duke University Medical Center, Durham, Nc, États-Unis,
(3) University Of Wisconsin, Washington, Dc, États-Unis

Context: Family physicians contribute substantially to contraception and uterine aspiration/D&C care, yet post-training provision varies. A cross-sectional analysis of 21,904 family medicine graduates who completed training during 2008–2018 and currently provided care to xxxx government program beneficiaries found that 61.1% provided prescription contraception, 18.5% provided IUD/implant care, and 0.7% provided D&C in 2019. Graduates from residencies with fully integrated, opt-out family planning curricula, larger program size, and community-based training emphasis had higher odds of providing these services after graduation. This workshop translates those empirically associated post-graduate training characteristics into adaptable training designs for diverse health systems.

Objectives: Participants will be able to: (1) summarize post-graduate training in community-based settings and with full integration of family

planning being associated with later provision of prescription contraception, IUD/implant services, and D&C; (2) map their local training pathway to identify where reproductive-health competencies are integrated, community-anchored, and repeated with sufficient clinical volume; and (3) design two locally feasible training upgrades aligned with the study's associated characteristics, each paired with a 90-day evaluation metric.

Teaching method and workshop: Interactive evidence-to-design workshop using a brief data walk-through, small-group experiential pathway mapping ("what learners see, do, repeat"), structured peer exchange, and a rapid design sprint. Handouts will be provided: 1)Training to Practice Experiential Pathway Map with questions and prompts, and 2)Stakeholder Mapping Exercise for Training Upgrade as an Implementation Plan Reality Check. 0–15 min—evidence pulse on outcomes and associated post graduate training characteristics. 15–30 min—experiential pathway mapping plus global translation prompts to locate uneven post-training provision in participants' contexts. 30–40 min—case-based discussion of common misalignments between current training structures and evidence-linked characteristics. 40–55 min—design sprint to draft two upgrades reflecting integrated exposure, community continuity, or scalable volume, followed by rapid stakeholder mapping. 55–60 min—commitments and metrics.

Expected outcomes: Participants will leave with a one-page training-to-practice alignment plan, two implementable curriculum or rotation changes tailored to their setting, stakeholder maps for each change, and indicators for short-term evaluation.

Conclusion: Post graduate training architecture—especially integrated family planning training and community-based emphasis—is associated with sustained reproductive-health provision after graduation. Applying these training features across settings may strengthen primary-care reproductive-health access and continuity.

(8) University Of Valencia, Valencia, Espagne

Context: According to the WHO, climate change is the greatest threat to global health in the 21st century, shaping disease distribution, patient vulnerability, and healthcare demands. Family doctors are increasingly confronted with climate-related conditions ranging from heat-associated illness and vector-borne infections to air-pollution–driven respiratory disease and post-disaster health challenges. Yet many primary care professionals lack structured, evidence-based tools to integrate climate exposure into clinical reasoning and patient counselling. This workshop addresses this gap by offering an innovative, quiz-driven, case-based learning experience grounded in real scenarios from diverse climatic regions that can be applied in all regions.

Objectives: By the end of the workshop, participants will be able to: 1) Recognise clinical presentations influenced by climate and environmental change 2) Apply climate-sensitive reasoning in diagnosis, management, and prevention within primary care 3) Analyse regional variations in climate-related health outcomes and adapt their approach accordingly 4) Collaborate to formulate climate-informed clinical questions and local action strategies 5) Integrate principles of climate awareness and sustainability into routine family practice to enhance community resilience.

Teaching method and workshop: The workshop uses an interactive quiz-based case format to actively engage participants. Small groups will receive clinical scenarios representing distinct climatic contexts—such as extreme heat, vector expansion, air pollution, or flood-related infectious risks. Groups will identify key risk factors, develop short quiz questions, and propose management strategies. Facilitators will guide discussions to ensure a strong scientific and evidence-based link between climate phenomena and health outcomes. A plenary session will synthesise insights across groups, reinforcing key messages and take-home tools. Workshop schedule: 10 min – Introduction and Planetary Health20 min – Group case discussions (4 cases) 20 min – Plenary sharing and

synthesis 10 min – Wrap-up, take-aways and reflection.

Expected outcomes: Participants will gain practical skills in climate-informed clinical reasoning, adaptive decision-making, and interprofessional collaboration. They will receive a curated resource list and be invited to join a global learning network for continued engagement in climate medicine.

Conclusion: This workshop equips family physicians with actionable knowledge, confidence, and practical strategies to address climate-related health challenges and to promote sustainable, resilient primary care in a rapidly changing world.

ID 671 - Workshop on deprescribing in patients with limited life expectancy

Jesse VAN WEELDEREN [(1)] , Matthew GRANT [(2)], Ankie HAZEN [(1)], Dorien ZWART [(1)]

(1) Centre Of Expertise In Palliative Care Utrecht, Julius Centre For Health Sciences And Primary Care, Department Of General Practice & Nursing Science, University Medical Centre Utrecht, Utrecht, The Netherlands, Utrecht, Pays-Bas,
(2) Palliative Nexus Research Group, Department Of Medicine, University Of Melbourne, Melbourne, Australia, Melbourne, Australie

Context: Patients with limited life expectancy frequently use potentially inappropriate medications (PIMs), leading to avoidable harms. They are often managed in primary care, however, deprescribing of PIMs remains poorly enacted. Reported barriers to deprescribing include negative perceptions of deprescribing, limited awareness of existing guidance, and poor communication. Several tools have been developed to facilitate deprescribing in this population, the STOPPFrail criteria being the most widely used. This extensively validated tool has shown to improve deprescribing of PIMs.

Objectives: 1. Increase awareness of and willingness to deprescribing in patients with limited life expectancy. 2. Increase knowledge on deprescribing benefits and evidence, the STOPPFrail criteria, and effective deprescribing communication strategies. 3. Learn to apply the STOPPFrail criteria.

Teaching method and workshop: This workshop will be focused on the use of small group learning following case-based discussions. In small groups, participants will apply the STOPPFrail criteria to a number of clinical cases and discuss how to engage in deprescribing discussions. Workshop schedule: - Case description (5 min). - Mini-lecture on medication use in patients with limited life expectancy, deprescribing, its benefits and current evidence, and the STOPPFrail criteria (10 min). - Application of STOPPFrail to clinical cases in small-groups, with subsequent plenary discussion (20 min). - Small-group discussion and plenary sharing on effective communication strategies for deprescribing, based on challenging clinical scenarios (20 min). Participants may share their own experiences. - Additional resources and workshop closing (5 min).

Expected outcomes: - To appreciate the evidence supporting deprescribing for patients with a limited life expectancy. - To identify which medications can be stopped and when. - To apply the STOPPFrail criteria to real patient cases. - To explore how deprescribing can be optimally communicated with patients. - To enhance confidence in engaging in deprescribing.

Conclusion: This workshop will equip participants with the knowledge, skills, and confidence to engage in safe and effective deprescribing practices for patients with limited life expectancy, ultimately aiming to improve the delivery of patient-centred, harm-reducing care and quality of life.

ID 696 - Palliative Care in noncancerous patients: practical skills for family physicians

Hanny YESHUA, Yael GILLERMAN, Boaz HASID, Nili ELIOR

Family Medicine Departement Clalit Health Services Tel-Aviv District, Tel Aviv, Israël

Context: Although palliative care (PC) is often associated primarily with oncology, its scope extends far beyond cancer. PC plays a crucial role in the comprehensive management of patients with serious chronic illnesses, including advanced COPD, severe congestive heart failure (CHF), and progressive dementia. It improves quality of life, assists with complex decision-making, reduces unnecessary interventions, and provides essential support to patients and families. Despite its value, PC training remains limited in many family medicine residency programs. Family physicians, who frequently care for patients with multimorbidity and progressive decline, require practical PC skills to integrate into everyday practice.

Objectives: This workshop aims to equip family physicians with foundational palliative care competencies in the noncancerous patient through interactive, case-based learning. Participants will strengthen clinical decision-making, enhance communication with patients and families, and build confidence in guiding goals-of-care discussions and symptom management.

Teaching method and workshop: Participants will engage in small-group discussions, case-based problem solving, and facilitator-led debriefing. Each case will highlight core PC principles, communication strategies, and real-world management approaches. Evidence-based guidance and practical communication tools will be emphasized throughout. Workshop Schedule: 0–5 min- Introduction: Why palliative care matters in noncancerous conditions. 5–20 min-Case 1, severe dementia: Managing feeding decisions, agitation, caregiver burden Discussing goals of care and advanced directives 20–35 min - Case 2 , advanced COPD: Dyspnea management, crisis planning, addressing anxiety Communicating prognosis and supporting end-of-life decisions 35–50 min - Case 3 , severe CHF: Symptom assessment and management 50–60 min -Summary & Reflection: Key take-home messages, practical tools for FM clinics, Q&A.

Expected outcomes: By the end of the workshop, participants will: Recognize the importance of PC in noncancerous chronic illness. Develop improved communication skills for discussions on prognosis, goals of care, and advance directives. Gain confidence in symptom management and end-of-life clinical decision-making. Understand how to integrate PC services effectively into family medicine practice.

Conclusion: This workshop provides FM physicians with practical tools to enhance their competency in palliative care for seriously ill patients, ultimately promoting more compassionate, patient-centered care. Keywords: Palliative Care, Family Practice, Quality of Life, Heart Failure, Dementia

ID 780 - Masterclass “Climate Smart Practice: How do I get started?”

Marie MAINGARD [1] , Jörg SCHMID [2], Kati KOOST [3], Carolina CORDOVIL [4], Aleksei PASHCHENKO [5], Abdul Careem AARA THILFAR [6], Mohamed Iqbal Mohamed SHUJA [7]

(1) Association Luxembourgeoise Des Médecins En Voie De Spécialisation (almevs), Luxembourg, Luxembourg,
(2) German Climate And Health Alliance (klug), Munich, Allemagne,
(3) Faculty Of Medicine, University Of Tartu, Tallinn, Estonie,
(4) European Young Family Doctors Movement (eyfdm), Lisbon, Portugal,
(5) Second Faculty Of Medicine, Charles University, Prague, Tchéquie,
(6) Senior House Officer Pediatrics ashraff Memorial Hospital, Kalmunai, Sri lanka,
(7) Faculty Of Medicine And Allied Sciences, Rajarata University Of Sri Lanka, Mihintale, Sri lanka

Context: Climate change poses an urgent global health threat, while healthcare systems remain significant contributors to greenhouse gas emissions. Family physicians and primary care providers play a vital role in leading sustainable healthcare transformation. Yet many clinicians are uncertain about where and how to begin implementing climate-smart and climate-neutral practices in their daily work. This masterclass offers practical guidance, tools, and peer learning opportunities, to help physicians take their first steps toward sustainable low-carbon healthcare.

Objectives: 1) Understand the basic concepts linking climate change and human health. 2) Describe principles of climate-neutral practice within healthcare settings. 3) Identify levels of climate action relevant to physicians - at the individual, institutional, and community level. 4) Connect with networks and organizations working in planetary health. 5) Utilize available tools and resources to initiate or strengthen climate-smart actions in their own workplaces.

Teaching method and workshop: This workshop adopts an interactive and problem-based learning approach. It begins with a brief presentation outlining essential concepts on climate change and health, drawing on current evidence and established planetary health guidelines. Participants then work in small groups to identify barriers and explore opportunities for adopting climate-smart practices in their workplaces. Each group examines real-world examples and evaluates practical tools and frameworks that support sustainable healthcare. The facilitators guide these discussions and conclude with a plenary synthesis of key insights and lessons learned. 10 min – Introduction on planetary health 20 min – Brainstorming in small groups about the pathways and barriers to implement climate-smart strategies in their practice 20 min – Plenary sharing and synthesis 10 min – Wrap-up, take-aways and reflection.

Expected outcomes: Participants will gain foundational knowledge, confidence, and practical strategies to begin integrating climate-smart principles in their professional environments. They will also develop connections with peers and organizations supporting sustainable healthcare initiatives.

Conclusion: This masterclass empowers primary care clinicians to take practical, achievable steps toward climate-smart healthcare. Through foundational learning and collaborative problem-solving, participants leave with greater confidence, useful tools, and new professional connections to support sustainable practice change.

ID 786 - Strengthening critical appraisal skills for qualitative research in primary health care

Radost ASSENOVA [(1)], Lieve PEREMANS [(2)] , Ana Luisa NEVES [(3)], Sara Ares BLANCO [(4)], Pemra UNALAN [(5)]

(1) Medical University Of Plovdiv, Dept Urology And General Practice, Plovdiv, Bulgarie,
(2) University Of Antwerp, Antwerp, Belgique,
(3) Apmgf, Porto, Portugal,
(4) Semfyc, Madrid, Espagne, (5) Marmara University, School Of Medicine, Istanbul, Türkiye

Context: Qualitative research provides essential insights into patient experience, health system functioning, and contextual factors shaping clinical work, yet many primary health care professionals feel uncertain about how to assess the methodological quality and relevance of such studies. Limited exposure to formal training in qualitative methods further contributes to difficulty in evaluating the trustworthiness and applicability of qualitative findings. Enhancing appraisal skills is therefore fundamental for fostering research literacy and supporting evidence-informed practice in primary health care.

Objectives: This workshop aims to enable participants to: • Understand key components of qualitative design, including sampling, data collection, and analytic approaches. • Apply a structured critical appraisal framework to judge credibility, dependability, and transferability. • Identify strengths and limitations in published qualitative studies. • Evaluate when qualitative evidence can inform clinical care, teaching, or organisational decisions.

Teaching method and workshop: The session uses an interactive, learner-centred design tailored to clinicians, trainees and researchers with varying levels of experience. Methods include a brief introductory presentation, guided small-group appraisal of selected qualitative studies using a structured tool, and facilitated discussions to compare assessments and explore divergent interpretations. The workshop emphasises active participation, peer learning and practical application. Workshop schedule: The 60-minute programme consists of: • Introduction to key concepts (0–10 min)• Small-group critical appraisal activity (10–25 min) • Facilitated discussion and synthesis of criteria (25–45 min) • Application to clinical and educational practice (45–55 min) • Summary and questions (55–60 min).

Expected outcomes: Participants will gain a clearer understanding of methodological quality in qualitative research, increased confidence in applying appraisal criteria, and practical tools for deciding whether qualitative findings are relevant and trustworthy. The skills acquired can be used immediately in clinical work, teaching, supervision, and local quality improvement initiatives.

Conclusion: By combining concise theoretical input with structured hands-on analysis, this workshop responds to a recognised need for improved qualitative research literacy in primary health care. It equips participants with transferable appraisal skills that support more rigorous use of qualitative evidence in practice, education, and policy development. Keywords: Qualitative Research; Primary Health Care; Critical Appraisal; Evidence-Based Practice; Research Literacy.

ID 819 - FAIR game: real-life session of bringing FAIRness into your organization

Lucy OVERBEEK, Jasper SCHMITZ, Myrthe SWART, Yvette WEESIE, Carlijn HOFHUIZEN, Isabelle BOS, Karin HEK, Robert VERHEIJ

Nivel-Netherlands Institute For Health Services Research, Utrecht, Pays-Bas

Context: The Findable, Accessible, Interoperable and Reusable (FAIR) principles aim to maximize the reuse of (research) data to researchers all over the world. Thereby, FAIR data contributes to liberty and equity among researchers. Today, FAIR data has become a hot topic, but many organisations are struggling where and how to start improving the FAIRness of their (research) data. People talk about

FAIR data, but mostly in meetings that sadly never end with concrete follow-up actions. In this workshop we will teach how to start working on improving the FAIRness of data by playing a game. This FAIR game is based on our own experience of building a FAIR Data Point for the Nivel Primary Care Database. This FAIR Data Point is a single location for researchers to upload metadata about their (primary care) datasets so other researchers can find them across multiple repositories.

Objectives: Learning objectives: - How to start working on FAIRness in your organisation - Awareness of the different required roles (researchers, IT staff, managers) - How to communicate with colleagues and stakeholders on FAIRness, how to speak the same language.

Teaching method and workshop: We will go through a real-life session of improving FAIRness by playing a game. All of the attendants have a role to play in this game (researchers, IT staff, managers). Whether or not this role matches their real-life job description, doesn't matter. Workshop schedule: introduction (5 min), game round 1 (20 min), game round 2 (20 min), wrap-up (10 min).

Expected outcomes: After playing the game, attendants have experienced how to start working on FAIRness of datasets. They have gained confidence and are ready to start working on FAIRness of datasets in their organisations.

Conclusion: Working on FAIRness is not an easy task as it includes multiple related subtasks and it requires collaboration between different professionals (researchers, IT staff, and managers). However, by setting a clear goal, having the right people on board, and speaking each other's language, FAIRness of (research) data can be significantly improved. As a result, available datasets can be more easily and faster reused by researchers which accelerates the research lifecycle.

ID 969 - Recruiting patients for primary care research: practical DIY solutions for GPs from European experience

Karolina GRIFFITHS [1] , Julie DUPOUY [2], Ileana GEFAELL [3], Dipesh GOPAL [4], Raquel GOMEZ BRAVO [5], Serge ENGAMBA [6], Mathilde FRANCOIS [7]

(1) Département Universitaire De Médecine Générale. Faculté De Médecine De Montpellier-Nîmes; Maison De Santé Pluridisciplinaire Montpellier Cevennes, Montpellier, France,
(2) Must The Multidisciplinary University Network For Primary Care Research In The Territories; Département Universitaire De Médecine Générale Toulouse Toulouse, Toulouse, France,
(3) Research Unit Primary Care Management, Madrid, Espagne,
(4) Centre For Primary Care, Queen Mary University Of London, London, Royaume-Uni,
(5) Centre Hospitalier Neuropsychiatrique, Ettelbruck, Luxembourg,
(6) Pact (primary Care Academic Collaborative), Exeter, Royaume-Uni,
(7) Université De Versailles Saint-Quentin En Yvelines, Paris, France

Context: To strengthen primary care and generate evidence relevant to real-world practice, GP involvement in research is essential. Engaging general practitioners (GPs) to particpate in research studies and clinical trials is a well-recognised challenge. Competing clinical demands, administrative burdens and limited research infrastructure can reduce their capacity to identify and recruit eligible patients. Countries across Europe have implemented pragmatic, low-cost strategies that strengthen recruitment of frontline GPs. This interactive workshop presents concrete, evidence-based examples from four European countries to illustrate what has worked, what has not, and how different systems support (or fail to support) the participation of busy GPs. Using these examples to encourage reflection on similarities and differences in their own settings, we will discuss how a simple intervention may be further evaluated using a Study Within A Trial (SWAT) approach.

Objectives: By the end of the workshop, participants will be able to: 1. Describe evidence-based strategies that have improved GP recruitment in European primary-care studies. 2. Interpret how and why these strategies were effective. 3. Evaluate which types of support (e.g., research staff, communication methods, digital tools) could be most appropriate for their own practice. 4. Draft a short, feasible recruitment plan for a future study in their own setting, including one component suitable for SWAT evaluation.

Teaching method and workshop: • Case-based introduction, with practical insights from EGPRN and four different national research networks: XXXX, XXXX, XXXX MUST national research network, the XXXX PACT (Primary care Academic CollaboraTive), including personalised outreach, peer-to-peer communication, WhatsApp micro-communities and rapid mobilisation of clinical insight. (20 minutes) • Interactive polling to gather participants' experiences, perceived barriers and solutions (10 minutes) • Small-

group “Recruitment Design Lab”, mixed-country groups co-create a concise, feasible recruitment plan and identify one testable SWAT element. (20 minutes) • “Recruitment DIY Toolkit” Wrap up with shared strategies (10 minutes).

Expected outcomes: Participants will leave with actionable, evidence-informed strategies to improve GP recruitment, an understanding of how SWATs can rigorously evaluate such approaches, and a set of practical tools adaptable to diverse European primary-care systems.

Conclusion: Understanding how research practices vary across Europe will empower participants to apply and adapt recruitment strategies to their own settings.

Corresponding author: Karolina Griffiths, karolinagriffiths@hotmail.com

ID 977 - How the Positive Health and mindmapping tools support shared decision making in adolescents with psychosocial problems.

Karolien VAN DEN BREKEL-DIJKSTRA, Marloes GERRITS, Lidewij WIND

Julius Health Centers Utrecht, Utrecht, Pays-Bas

Context: Adolescents often visit our practice with psychosocial problems and medically unexplained symptoms such as tiredness, headache or abdominal pain. By just focusing on the presented symptom, problems are often not solved. Collaboration between the adolescent, the caregivers, and the GP by using easy and structural visualization tools (Positive Health and mindmapping) systematically can enhance resilience and recovery by empowering the adolescent to make choices of change. In an implementation study, this approach also increased work pleasure for GPs.

Objectives: To learn about the background, experiences and implementation of the easy visualization Positive Health (spiderweb) and the mindmapping tools. Both tools provide insight (for the adolescent and the GP) in the current health situation with a broad perspective towards health. The focus will be on the strengths and empowerment of the adolescent. The tools emphasize working together with the adolescent, and invite the adolescent to reflect on the current situation rather than just at the problem and encourages them to make choices that improve the situation themselves.

Teaching method and workshop: After explanation of both visualization tools, best practices with Positive Health for adolescents will be shared. The participants are invited to practice and experience both tools in groups of 3, the GP, the teen and the observer. introduction of both visualization tools (10 min) practice in groups of three with both tools and psychosocial cases (40 min) discussion, take home messages, how start tomorrow (10 min).

Expected outcomes: Participants will be inspired by tools with a broad perspective on health for adolescents. They will not only learn about the empowerment for the young adults and the positive effect on workpleasure of the GP's, they will also experience it themselves. By working in small groups the participants will feel the power of the visual support of the tools, followed by setting goals, and examining ways for solution and broaden their GPs toolkit.

Conclusion: After the workshop colleagues will be inspired how Positive Health and mindmapping tools support shared decision making in adolescents with psychosocial problems and are curious to start working with this tool and apply this the next day in their own work.

ID 1001 - Doctor Strange: Multiverse of Mental Health Emergencies

Hamid ALIAHMAD [(1)] , Dina SALKOVIC [(2)], Kerime DURSUN [(3)], Mary JOHN-CHARLES ROBERTSON [(4)], Chaimae OUAHHOUDI AJOUINI [(5)], Liga ISAJEVA [(6)], Karolína JANČAROVÁ [(7)], Ana Peral MARTÍN [(8)], Aliona FOMIN [(9)]

(1) Em Sig, Rotterdam, Pays-Bas,
(2) Sanitas Health Centre, Rotterdam, Pays-Bas,
(3) None, Rotterdam, Pays-Bas,
(4) Rcgp Severn Faculty, Bristol City, Royaume-Uni,
(5) Natahoyo Health Centre, Gijon, Espagne,
(6) Alises Nicmanes Gimenes Arsta Prakse, Riga, Lettonie,
(7) Ordinace Pokorná A Bezdíčková S.r.o., Prague, Tchéquie,
(8) Centro De Salud Paseo Imperial. Semfyc, Madrid, Espagne,
(9) Usf Sje Dos Loios, Lisbon, Portugal

Context: Acute mental health presentations are increasingly encountered by general practitioners in both daytime practice and out-of-hours settings. Clinicians must rapidly assess risk, communicate clearly, and make appropriate triage decisions in situations involving intoxication, suicidal ideation,

acute psychosis, or behavioural disturbances related to dementia. Acute Behavioural Disturbance (ABD) may also occur, presenting with severe agitation or aggression; management typically begins with verbal de-escalation, with the option of oral or intramuscular (IM) medication such as benzodiazepines when necessary. These scenarios often evolve unpredictably and require a structured yet flexible approach. This workshop uses a "multiverse" concept as an engaging framework to demonstrate how similar presentations can lead to different outcomes depending on early recognition of red flags and chosen management strategies.

Objectives: 1. Recognise key warning signs in common acute psychiatric emergencies in primary care. 2. Apply practical, structured approaches to risk assessment in intoxication, psychosis, suicidal thoughts, and behavioural crises in dementia. 3. Identify when de-escalation, referral, or immediate safety measures are required. 4. Strengthen confidence in communication and decision-making during high-stakes encounters.

Teaching method and workshop: The workshop will primarily use interactive scenario-based cases with simulation patients. Short introductions to each scenario will be followed by participant-driven exploration, allowing clinicians to practise recognition, communication, and decision-making skills in real time. 5 min — Introduction 45 min — Interactive scenarios with simulation patients 10 min — Group discussion and closing take-home points

Expected outcomes: Participants will leave with improved recognition of red flags, greater confidence in acute mental health assessment, and a clearer structure for safe and effective management in both routine and out-of-hours primary care.

Conclusion: Doctor Strange: Multiverse of Mental Health Emergencies offers a fun yet highly practical exploration of acute psychiatry in general practice. Through relatable cases, active participation, and straightforward decision tools, the workshop provides skills that clinicians can apply immediately in everyday practice.

ID 1004 - European Young Family Doctors Movement Exchanges

Yanica VELLA [(1)] , Raisa ALVAREZ PANIAGUA [(2)], Ines GOMES RIBEIRO DE CASTRO [(3)], Aleksandra MAYKUT [(4)], Socha MALGORZATA WARSZAWSKA [(4)]

(1) Primary Health Care Malta, Gzira, Malte,
(2) Seris, Rio Alhama, Espagne,
(3) Usf Cedofeita-Uls Santo Antonio, Porto, Portugal,
(4) The College Of Family Physicians, Warsaw, Pologne

Context: Connecting doctors across the globe is key to maintaining educational and cultural exchanges whilst gaining a deeper understanding of yourself and those around you. Strengthening international relationships whilst sharing ideas is key to what the European Young Family Doctors Movement promotes. Exchanges provide the opportunity and also aid to kick start connections both during the exchange and after. Building bridges between countries from all over the world and looking into disparities in health care and ways of improving them. This has been clearly outlined in the Bridge Project that has been running over the past years.

Objectives: For the taget audience to have a clear understanding of what exachgnes are all about, their benefits and also ways in how to get involved.

Teaching method and workshop: 1. What is EYFDM 2. Types of exchanges offered 3. How to apply 4. Countries offering exchanges 5. Outlining the benefits of going on an exchange 6. Bridge project.

Expected outcomes: Sharing ideas. Welcoming new NECs and also discussing issues and ways of improving things within the organization to better things within the exchanges world. Clearer understanding of how to get involved and also apply to undergo such exchange programs. Presentations for the Exchange Awards held in 2025.

Conclusion: Exchanges offer more than academic growth, they broaden your worldview, strengthen your independence and help build meanigful connections across cultures. Participating in an exchange program provides invaluable experience, fosters global awareness and encourages participants to challenge things and equips them with knowledge and mindset needed to succeed in and increasingly interconnected world.

ID 1010 - MI or not MI? Decoding the myocardial infarction ECG without the stress

Elena KLUSOVA NOGUINÁ [(1)], Rocío GARCÍA-GUTIÉRREZ GÓMEZ [(2)] , Miriam REY SEOANE [(3)], Dina SALKOVIC [(4)], Rabee KAZAN [(5)], Ana PERAL MARTÍN [(6)], Hamid ALIAHMAD [(7)], Mary John-Charles ROBERTSO [(8)], Karolina BRAUN [(9)], Liga ISAJEVA [(10)]

(1) Samu061, Ibiza, Espagne,
(2) Hospital Universitario Severo Ochoa (leganés), Madrid, Espagne,
(3) Ics Barcelona / Cuap Manso, Barcelona, Espagne,
(4) Sanitas Health Centre, Rotterdam, Pays-Bas,
(5) Cap Rambla, Udmafic Mutua Terrassa, Barcelona, Espagne,
(6) Centro De Salud Paseo Imperial., Madrid, Espagne,
(7) Astramed010, Rotterdam, Pays-Bas,
(8) Rcgp Severn Faculty, Gloucestershire Hospitals Nhs Foundation Trust, Bristol, Royaume-Uni,
(9) Leiden University Medical Center, Leiden, Pays-Bas,
(10) Alises Nicmanes Gimenes Arsta Prakse, Riga, Lettonie

Context: Chest pain and ECG interpretation remain among the most frequent and challenging presentations in primary and urgent care. Family doctors often face time-pressured decisions with limited tools, which increases uncertainty and the risk of over- or under-diagnosis. Many clinicians report that their confidence drops not from lack of knowledge, but from the stress associated with distinguishing benign variants from true myocardial infarction patterns. A practical, case-driven approach can significantly reduce this stress and improve diagnostic clarity.

Objectives: 1. Identify key ECG features suggestive of acute myocardial infarction relevant to primary care settings. 2. Distinguish MI ECGs from common mimics using simple, structured interpretation strategies.3. Apply step-by-step decision pathways to improve diagnostic confidence during time-sensitive encounters. 4. Integrate practical tips to avoid common interpretation errors and unnecessary referrals.

Teaching method and workshop: The workshop will use brief interactive presentations, real-case ECG examples, and large-group discussion. An interactive “MI or not MI?” challenge will be conducted using a gaming-style platform (e.g.,Kahoot or similar), followed by expert explanations and collective clarification of doubts. Workshop schedule (60 minutes): 5 min — Introduction: why MI ECG interpretation goes wrong in primary care. 20 min — Key ECG patterns: STEMI, subtle ischemia, and common mimics. 30 min — Interactive case challenge: “MI or not MI?” (group analysis + collective debrief). 5 min — Clinical shortcuts, safe decisions, and take-home messages.

Expected outcomes: Participants will leave with improved practical confidence in differentiating MI from non-MI ECGs, better recognition of red flags, and clearer decision-making strategies applicable to routine family practice. The workshop aims to reduce diagnostic anxiety and promote more consistent, evidence-based management across diverse clinical settings.

Conclusion: This workshop provides a simple, structured, and stress-free approach to ECG interpretation for myocardial infarction in primary care. By combining real ECGs, active participation, and practical decision tools, it offers family doctors skills they can apply immediately in daily practice.

ID 1051 - Next Level Learning through Serious Games for GP training

Kartal UÇAR, Monique HECTORS, Karin KAASJAGER

Schola Medica, Utrecht, Pays-Bas

Context: Serious gaming is emerging as a promising method in medical education, offering immersive learning environments that support rapid decision-making and safe practice of acute situations. Schola Medica has begun integrating serious games into its curriculum to strengthen learning efficiency and engagement. A pilot evaluation was conducted with two newly developed games: the Acute Diabetes Game 2025 and the Emergency Care Game 2026.

Objectives: The workshop aims to introduce key design principles of serious gaming, share preliminary pilot findings, allow participants to experience both games, and support them in applying game-based learning in their own educational contexts.

Teaching method and workshop: An exploratory pilot study investigated potential effects on clinical reasoning, knowledge retention, and learner engagement using a mixed-methods approach. The workshop combines short theoretical input with hands-on gameplay, guided reflection and case-based discussion. Schedule: -Introduction (10 min) -Gameplay Round 1: Acute Diabetes Game (15 min) -Gameplay Round 2: Emergency Care Game (15 min) -Presentation of pilot findings (5 min) -Case discussion (10 min) -Closing reflection (5 min).

Expected outcomes: Preliminary results suggest that serious gaming may support the development of clinical reasoning, with participants showing early indications of improved performance in simulated acute care scenarios.

Conclusion: Workshop participants are expected to gain insight into acute clinical decision-making, understand how serious games complement existing training, and acquire practical ideas for integrating gamification into primary care education.

ID 1063 - General Practitioners as future experts in European Union Health Technology Assessment

Daniel WIDMER [(1)] , Hermenegildo MARCOS CARRERA [(2)], Patrick OUVRARD [(3)]

(1) Uemo, Vevey, Suisse,
(2) Uemo, Zamora, Espagne,
(3) Uemo, Angers, France

Context: UEMO, the political association of GPs in Europe, participated as stakeholder to the discussions for the EU Regulation on Health Technology Assessment (EU-HTA) (1). Clinical assessments began in early 2025. Patients and clinicians' experts are being sought by EU-HTA and GPs will be needed each time a new technology should impact their practice considering workload, equity, multimorbidity, prevention from primary to quaternary. WONCA as academic association is mandated to find GPs experts.

Objectives: Presentation of the political process of EU-HTA. Multi-stakeholder discussion. Evolution of the point of view of UEMO about the role of GPs in the process since the first comments of I. Heath in 2004(2). Difference between expert and stakeholder. How to become an expert?

Teaching method and workshop: Teaching methods: 3 presentations followed by a discussion between participants about the possibility, opportunity, feasibility or risks to be a GP expert. Workshop schedule: - UEMO presentation of the work as stakeholder (Dr. D. Widmer delegate, former vice-president and Dr Hermenegildo Marcos-Carrera, vice president) 10 min. - How to build a multi-stakeholder discussion? (Prof. Joerg Ruof, European Access Academy) 10 min - How to be an expert for EU-HTA? (Marcus Guardian, General Manager – Brussels Centre for Collaboration in Health) 10 min - Discussion. 45 min - Conclusion with Iona Heath. 10 min

Expected outcomes: Better understanding of EU-HTA process and possibility to ask questions about the place of GPs in the process.

Conclusion: Discussion with Iona Heath. Evolution from her 2004 paper to the Regulation. 1. EU-HTA Regulation. https://eur-lex.europa.eu/eli/reg/2021/2282/oj/eng 2. Heath I. View of health technology assessment from the swampy lowlands of general practice. Int J Technol Assess Health Care. 2004 Winter;20(1):81-6. doi: 10.1017/s0266462304000832. PMID: 15176182.

ID 1067 - Basic LGBTIQ+ Support (BLS): Providing adequate care for our LGBTIQ+ patients in primary care

Niklas JESKE [(1)] , Pierre-Louis DEUDON [(2)], Stuart HOLMES [(3)], Philip OESER [(1)], Anna WITTENSTEIN [(1)], Wolfram HERRMANN [(1)]

(1) Charité-Universitätsmedizin Berlin, Corporate Member Of Freie Universität Berlin And Humboldt-Universität Zu Berlin, Institute Of General Practice And Family Medicine, Charitéplatz 1, 10117 Berlin, Berlin, Allemagne,
(2) Société Scientifique De Médecine Générale, Sexual Health Expert, Rue De Suisse 8, 1060 Saint-Gilles, Saint-Gilles, Belgique,
(3) Indigo Gender Service, Manchester, M34 2gp, Manchester, Royaume-Uni

Context: Patients from the LGBTIQ+ community are at higher risk of experiencing loneliness, discrimination, mental health issues, and sexual health problems. These specific vulnerabilities increase their likelihood of developing various diseases and comorbidities, which deserve particular attention from family doctors. Furthermore, they may face violence and discrimination within healthcare settings. Family doctors can support these patients by improving access, providing non-judgmental healthcare, and enhancing the quality of care through the identification of specific risks and contexts.

Objectives: Support family doctors in developing a professional approach, enhancing their skills and confidence in treating LGBTIQ+ patients, guided by scientific evidence, clinical guidelines, a community approach and shared best practices.

Teaching method and workshop: The workshop can be adapted to the number of participants and to

participants' level of knowledge and interests through adjustment of the number of groups and group sizes. 1) Introduction and agenda (5 min) 2) Interactive poll (using Mentimeter or similar) to visualize participants' experience with LGBTIQ+ patients (5 min) 3) Short presentation: Vulnerabilities of patients from the LGBTIQ+ community (5 min) 4) Small-group work (30 min) discussing the following potential main themes: 4.1) The essentials: How to be a LGBTIQ+ friendly family practice 4.2) Gender-affirming care 4.3) Specific mental health issues affecting the LGBTIQ+ community 4.4) Sexually transmitted infections 5) Presentation of group work results and wrap-up (15 min)

Expected outcomes: Enhancing participants' understanding of the vulnerabilities faced by LGBTIQ+ patients, while developing their skills to actively address common health issues and overcome potential barriers to healthcare access within this community.

Conclusion: LGBTIQ+ patients face specific risks and have specific needs that can be challenging for us as family doctors. Based on scientific evidence, a community approach and best practice, this workshop aims to support family doctors and enhance their practical skills in providing comprehensive care for LGBTIQ+ patients.

ID 1073 - Nature prescribing in primary care: current practices and future prospects

Charlotte BRÉDA [(1)], Manon SCHWEICHER [(1)], Nicolas SENN [(2)], Aline SIGRIST [(2)]

(1) Camg/irss/uclouvain, Bruxelles, Belgique,
(2) Dmf/unisante, Lausanne, Suisse

Context: Healthcare professionals play a key role in promoting individuals' reconnection with nature through preventive and therapeutic approaches that integrate contact with biodiversity and nature into care practices. The concept of green/nature prescription is a recommendation by GPs, encouraging outdoor activities in natural environments to enhance patients' health and well-being.

Objectives: Investigate motivations and practices of GPs and primary care professionals regarding nature prescriptions Share experiences through narratives of nature prescription in various contexts Compare practices: identify pathologies, patient demographics, formalizations, and activities involved Identify barriers and levers to better integrate nature prescription in routine care Identify and map benefits for both patients and healthcare providers.

Teaching method and workshop: The workshop will follow a participatory collective intelligence methodology. Participants will be divided into five sub-groups. The session will be structured as follows: Introduction and context setting of nature prescription 10' Writing an individual short story of an innovative nature prescription (1p.) 10' Sharing narratives in sub-groups (structured questions) 15' Group discussion 20' Conclusion 5'.

Expected outcomes: Learning enhancements: acquisition of specific skills to integrate nature prescription into primary care practice New approaches: identification of original strategies and effective tools in the clinical context Evaluation of benefits: explore potential effects on patient well-being and GPs Collaborative protocols: development of adaptable protocols based on PC providers experiences Community of practice: creation of an international network of committed GPs and PC providers Data collection: production of a database on nature prescription practices.

Conclusion: The results aim to ensure a concrete application of the workshop's learnings and to promote a "nature-prescription best practices" network around nature prescription. This workshop model will serve as an experiment that can be refined for deployment in other contexts.

ID 1125 - Balancing values in obesity care: From guideline development to implementation

Lisette VAN DE LAAR, Jan JANSEN, Jip DE JONG

Dutch College Of General Practitioners, Utrecht, Pays-Bas

Context: Obesity is a major public health challenge, rooted in an obesogenic society and largely originating outside the healthcare domain. The development of a national guideline for obesity care (including pharmacological options) revealed tensions between scientific evidence and broader dimensions of healthcare quality. While randomized controlled trials provide answers on effectiveness and short-term safety of weight-loss medications, other dimensions—such as equity, timeliness, and affordability—require value-based deliberation. To address these complexities, we conducted a

comprehensive stakeholder analysis and environmental scan, identifying diverse interests and priorities across healthcare, policy, and patient advocacy.

Objectives: To explore how scientific knowledge can be translated into daily practice within societal constraints. To understand the six dimensions of healthcare quality and their relevance in obesity care. To reflect on value-based decision-making and navigating stakeholder interests in guideline development and implementation.

Teaching method and workshop: Interactive discussion based on real-world dilemmas encountered during guideline development. Participants will work with stakeholder analysis outcomes, implementation data, and ethical considerations through case-based learning. workshop schedule Introduction: framing obesity as a societal and healthcare issue Presentation: exploring the guideline development and implementation process in relation to the six dimensions of quality of care, particularly access and equity dilemmas Case discussions: taking a closer look at the different stakeholders and their interests Group reflection: balancing the values represented by those interests Wrap-up: implications for practice and policy.

Expected outcomes: Participants will gain insight into the complexity of implementing obesity guidelines in context of societal constraints and conflicting (stakeholder) interests. They will learn how stakeholder perspectives shape policy and practice and be better equipped to navigate ethical tensions and systemic constraints in obesity care.

Conclusion: Guideline development for obesity care requires more than scientific rigor—it demands ethical reflection and systemic awareness. In a context of limited resources and increasing demand, healthcare professionals must balance conflicting stakeholder interests and strive towards liberty, equity, and fraternity. This workshop offers tools and perspectives to support that process.

Corresponding author: Lisette Van De Laar, l.vandelaar@nhg.org

ID 1164 - XABCDE! Trauma first response: enhancing life-saving skills in primary care

Kyle Steven SMESTAD [(1)] , Alberto Kramer RAMOS [(2)], Elena KLUSOVA [(3)], Ana Peral MARTÍN [(4)], Karolina BRAUN [(5)]

(1) Kvam Herad / Norheimsund Legesenter, Norheimsund, Norvège,
(2) Servicio Urgencias Hospital Clínico Universitario Virgen De La Arrixaca (huva), Coordinador Gt Urgencias. Semergen, Murcia, Espagne,
(3) Samu061 Baleric Islands, Ibiza, Espagne,
(4) Centro De Salud Paseo Imperial. Semfyc, Madrid, Espagne,
(5) Leiden University Medical Center, Leiden, Pays-Bas

Context: Severe trauma is a major cause of preventable mortality, and a significant proportion of critically injured patients first encounter a family doctor, particularly in rural, semi-urban or community settings. Early assessment using the XABCDE framework—focusing on exsanguinating hemorrhage, airway, breathing, circulation, disability and exposure—is internationally recognised (ATLS, PHTLS, ERC Trauma) as a life-saving priority during the first minutes of care. However, many family doctors report limited training, low confidence and lack of structured tools to approach trauma systematically in low-resource primary care environments. This workshop addresses a core clinical gap by providing a practical and scalable method for early trauma recognition and response.

Objectives: 1. Understand and apply the XABCDE primary survey of a injured patient. 2. Identify time-critical findings requiring immediate action or urgent EMS activation. 3. Perform simple, high-impact interventions (hemorrhage control, airway positioning, shock recognition). 4. Improve structured communication with emergency services using recognised handover formats. 5. Integrate trauma first-response principles into daily primary care practice.

Teaching method and workshop: A 60-minute hybrid workshop combining: - Brief evidence-based theoretical input introducing the XABCDE sequence. - Faculty-led demonstration of the primary survey using a simulated casualty. - Participant guided analysis through short clinical vignettes and “what-would-you-do” scenarios. - Interactive discussion focused on prioritisation, errors to avoid, and adaptation to different primary care contexts. 10 min – Introduction: epidemiology, role of the family doctor, rationale for XABCDE. 15 min – Step-by-step explanation of XABCDE with real-case examples.20 min – Live demonstration of the primary survey + recognition of red flags. 10 min – Interactive clinical cases: decision-making under time pressure. 5 min – Key messages, takeaway tools and integration into practice.

Expected outcomes: Participants will acquire a clear, structured approach for assessment of trauma, improved confidence in identifying life-threatening conditions, and practical skills

applicable in pre-hospital environments. They will leave with actionable tools to improve patient safety, reduce delays in care and strengthen collaboration with emergency medical services.

Conclusion: This workshop offers a concise, evidence-based and highly applicable framework to support family doctors in delivering rapid, safe and structured first-response care in severe trauma. The hybrid format maximises learning within 60 minutes.

Corresponding author: Kyle Steven Smestad, kyle.smestad@gmail.com

ID 1174 - International collaboration in primary care research: engaging, enjoyable and needed for complex trials

Alike VAN DER VELDEN [(1)], Samuel COENEN [(2)] , Akke VELLINGA [(3)], Christopher BUTLER [(4)]

(1) University Medical Center Utrecht, Utrecht, Pays-Bas,
(2) Department Of Family Medicine & Population Health, University Of Antwerp, Antwerp, Belgique,
(3) University College Dublin, Dublin, Irlande,
(4) University Of Oxford, Oxford, Royaume-Uni

Context: Research in primary care can be challenging, particularly when recruiting patients with acute illness. Regulatory, legal and logistical challenges, alongside fragmented funding mechanisms, add further complexity. These issues are even more pronounced in infectious disease research, where timely recruitment and coordination are critical. Established primary care research networks can provide the infrastructure, trusted relationships and operational readiness needed to roll out studies immediately when urgent questions arise, as seen during the COVID-19 pandemic. Without such networks, early evidence generation is delayed and opportunities to guide clinical practice and management are lost.

Objectives: - Increase awareness of existing initiatives such as GRIN (General Practice Research on Infections Network) and the 18-country primary care research network. - Share experiences from ongoing international studies and trials. - Explore common barriers to international collaboration in primary care infectious disease research. - Discuss opportunities to a unified approach to streamline future complex trials.

Teaching method and workshop: Short presentations by network leaders followed by targeted discussion points to promote interactive dialogue. Participants will be invited to reflect on experiences, identify shared challenges and contribute ideas for strengthening international research capacity. SC will outline the history of international collaboration in infectious disease research. AvdV will present past and current trials focussing on respiratory infections across the 18-country network. AV will highlight audit opportunities within this network, also supporting antimicrobial stewardship, and demonstrate online options for wider participation. CB will present upcoming funding opportunities, including the Be-READY initiative.

Expected outcomes: Participants will gain a clearer understanding of existing networks and opportunities to join. The workshop will facilitate sharing ideas, discuss practical solutions to operational barriers and encourage collaboration across countries to generate research ideas and support future trials.

Conclusion: Strengthening international primary care research networks now will support faster, coordinated and more impactful evidence generation for infectious disease research and future pandemic preparedness.

Corresponding author: Alike Van Der Velden, a.w.vandervelden@umcutrecht.nl

ID 1177 - Evidence-based nutrition strategies for chronic disease management in primary care

Vilma KRIAUCIONIENE [(1)] , Tehila MAZAL [(2)], Rosália Cristina GABRIEL PÁSCOA [(3)], Gökçe IŞCAN [(4)], Lilach MALATSKEY [(5)]

(1) Faculty Of Public Health, Lithuanian University Of Health Sciences, Kaunas, Lituanie,
(2) Israel Lifestyle Medicine Society; Israel Association Of Family Physicians, Ramat Gan, Israël,
(3) Medcids And Rise-Health, Faculty Of Medicine, University Of Porto; Homem Do Leme Family Health Unit. Portuguese Society Of Lifestyle Medicine, Porto, Portugal,
(4) Kütahya Health And Science University, Kütahya, Türkiye,
(5) Bar Ilan University Israel, Ramat Gan, Israël

Context: Chronic non-communicable diseases (NCDs) represent a substantial burden in primary care. Unhealthy nutrition habits, characterized by a low intake of vegetables, fruits, legumes, and whole grains, and a high intake of sodium, added sugars, and ultra-processed foods, are major modifiable contributors to these conditions. Despite strong evidence supporting nutrition interventions, family doctors often face time constraints, limited nutrition training, and uncertainty about providing brief

dietary counselling. This workshop addresses the need for practical, evidence-based tools that can be efficiently integrated into routine consultations to support the prevention and management of NCDs.

Objectives: 1. To provide a clear, evidence-based overview of nutrition principles relevant to chronic disease prevention and management. 2. To develop participants' skills in conducting brief nutrition assessments using practical tools such as healthy plate models, short questionnaires, and SMART goal techniques within time-limited consultations. 3. To strengthen physicians' ability to analyse clinical cases and translate nutrition recommendations into personalised, achievable goals for effective routine counselling.

Teaching method and workshop: 1. Theoretical part with quiz. A concise evidence overview introduces key mechanisms linking diet with major NCDs. Healthy nutrition recommendations (Mediterranean Diet, Healthy Plate Models, Nordic Nutrition Recommendations, etc.) and evidence-based nutrition guidelines for type 2 diabetes, obesity, hypertension, dyslipidaemia, and non-alcoholic fatty liver disease will be presented. A short quiz supports active engagement. 2. Brief nutrition assessment techniques. Participants practise using short questionnaires, plate models, and structured SMART goal setting to identify dietary risks, prioritise counselling topics, and deliver effective guidance within short consultations. 3. Small-group case work. Working in small groups, participants analyse realistic NCD-related clinical cases, select appropriate assessment tools, and formulate personalised SMART nutrition goals that translate recommendations into feasible behavioural actions. Workshop schedule: 60 minutes (20 min. each part).

Expected outcomes: Participants will gain practical tools for brief nutrition counselling, increased confidence, and an enhanced ability to translate evidence-based recommendations for NCD prevention and treatment into personalised nutrition goals.

Conclusion: This workshop equips primary care clinicians with practical, evidence-based nutrition tools to use in routine consultations, enabling them to guide patients toward sustainable dietary changes that support the prevention and management of chronic diseases. Keywords: Nutrition recommendations; Chronic disease; Patient counseling

(7) Gp, Ordinace Života Zlín, Czech Republic, Zlin, Tchéquie,
(8) Centro De Saúde Do Bom Jesus Sesaram Eperam Ilha Da Madeira, Portugal, Madeira, Portugal,
(9) Lecturer, Faculty Of Medicine And Allied Sciences, Rajarata University Of Sri Lanka., Rajatara, Sri lanka

Context: Primary care consultations often focus on disease management, leaving limited time for broader well-being. The Positive Health framework, visualized through the "spider web," and the Lifestyle Wheel ("Leefstijlroer") offer practical tools to shift conversations toward resilience, meaningfulness, and self-management. This workshop introduces these concepts and demonstrates how they can be integrated into routine consultations to empower patients.

Objectives: Participants will: • Become familiar with the core principles of Positive Health and the spider web tool. • Practice asking domain-focused, empowering questions. • Explore the Lifestyle Wheel as a structure for lifestyle change. • Develop skills to support patient-led goal setting.

Teaching method and workshop: The workshop will combine a short presentation, small-group case discussions, role-play exercises, and guided reflection. Active participation is encouraged to build confidence and transferable skills. Workshop schedule (60 minutes) • Introduction & theory overview (10 min) • Case presentation and spider web domain questioning practice (20 min) • Introduction to the Lifestyle Wheel (10 min) • Role-play: facilitating patient-led lifestyle change (15 min) • Reflection & key takeaways (5 min).

Expected outcomes: Participants will gain practical experience applying Positive Health tools in consultations, feel more confident in exploring multiple life domains with patients, and be able to facilitate lifestyle change conversations in a patient-centered manner.

Conclusion: This workshop provides a concise, hands-on introduction to Positive Health and the Lifestyle Wheel, equipping clinicians with tools to promote patient ownership and holistic care in daily practice.

ID 1260 - How to fight back: design thinking to reshape healthcare

Rita ABECASIS (1) , Paula SALA-IVARS (2), María Dulce MONZÓ MARTÍNEZ (2), Hana RUFEROVA (3), Ikbal HUMAY ARMAN (4), Ana GORJÃO (5), Leonor BERNARDES (5)

(1) Primary Health Care Area, Unidade De Saúde Familiar Da Baixa, Unidade Local De Saúde São José, Lisboa, Portugal Centro Clínico Académico De Lisboa, Lisboa, Portugal, Lisboa, Portugal,
(2) University Of Valencia, Valencia, Spain, Valencia, Espagne,
(3) Senecio S.r.o., Prague, Czech Republic, Prague, Tchéquie,
(4) Istanbul Medipol University, School Of Medicine, Department Of Family Medicine, Istanbul, Turkiye, Istanbul, Türkiye,
(5) Unidade De Saúde Familiar Do Arco, Unidade Local De Saúde São José, Lisboa, Portugal, Lisboa, Portugal

Context: Primary care across Europe is under strain with staff shortages, bureaucracy, burnout and growing expectations for patient centered care. Traditional structures often feel rigid for teams and confusing for patients. Professionals on the front line need practical tools to rethink how work is organised and how care flows across services.

Objectives: List concrete organizational pain points in their own setting related to workforce, bureaucracy or continuity of care. Use a simple design thinking framework to turn one of these pain points into a clear problem statement that patients and professionals would recognize. Generate and prioritise at least five ideas for improving talent attraction or retention, work environment or work life balance in primary care. Build a short pitch that describes one solution concept, its intended users, the first small test to try in practice and one basic measure of success.

Teaching method and workshop: The session starts with a brief and playful introduction to design thinking in health care using examples from across different industries. Participants then move into small groups and work with a structured canvas. Each group focuses on a challenge such as recruitment and retention, workload and bureaucracy, team climate or continuity of care. Groups create one solution concept and outline a first small test. Opening, context and design thinking basics (10 minutes). Group work phase one: understand and define (10 minutes). Group work phase two: generate and select ideas (15 minutes). Group work phase three: outline a simple prototype or first test (10 minutes). Final pitch session 15 minutes where each team presents a short pitch of their concept followed by brief feedback from peers.

Expected outcomes: Participants leave with concrete ideas and first step plans for their own settings plus a design thinking template to reuse with colleagues and patient partners. The pitch format supports ownership and shared purpose around making primary care a place where professionals want to work and patients feel heard.

Conclusion: This workshop helps primary care teams step out of survival mode, think together and reclaim the design of their services.

ID 1317 - Person-centred and integrated care for patients in vulnerable positions: From evidence to practice

Monique KOKS-LEENSEN [(1)], Jeanine SUURMOND [(2)] , Maria VAN DEN MUIJSENBERGH [(2)], Hester VAN BOMMEL [(2)]

(1) 1. Radboud University Medical Center, Department Of Primary And Community Care, Nijmegen, The Netherlands 2. Academic Collaborative Intellectual Disability And Health-Sterker Op Eigen Benen, Nijmegen, The Netherlands, Nijmegen, Pays-Bas,
(2) 1. Radboud University Medical Center, Department Of Primary And Community Care, Nijmegen, The Netherlands 2. Pharos, Dutch Centre Of Expertise On Health Disparities, Utrecht, The Netherlands, Nijmegen, Pays-Bas

Context: Person-centred care is a core value in general practice. It means focusing on the whole person rather than just their disease, considering individual characteristics, needs, and context. This approach is particularly important for patients with limited health literacy or in unfavorable socioeconomic circumstances, who often face

multiple health and/or social problems, like co-morbidities, poverty or chronic stress. Turning this principle into practice is not always straightforward, particularly for those patients who find it difficult to express their concerns and needs. In this workshop, we present evidence on the importance of person-centred care for this group and share practical tools and strategies. Participants will learn about a co-created conversation tool to facilitate meaningful dialogue to understand patients social context.

Objectives: After attending this session, participants will: Understand challenges in person-centered care for patients in vulnerable positions and the importance social context; Identify key aspects to discuss during consultations to gain insight into patients' context, needs, and preferences. Develop practical ideas on how GPs can better tailor care to these patients and collaborate effectively within network-based care and the social domain.

Teaching method and workshop: The first part includes a presentation (20 min) on research into experiences and needs in GP care of patients in vulnerable positions and the importance of person-centered approaches. This is followed by a 10-minute group discussion on shaping personalized primary care from participants' perspectives. The second part (30 minutes) involves a demonstration of a conversation tool that GPs can use to support meaningful dialogue. Participants will discuss the tool and explore opportunities for daily practice.

Expected outcomes: Participants will gain: awareness of the importance of person-centred care for patients in vulnerable positions practical support to better address health needs and context to apply person-centered care.

Conclusion: Patients in vulnerable positions face unique challenges in understanding and navigating healthcare. Person-centred care is therefore not just a core value but a critical strategy for this group and calls on to GPs as essential care providers to understand these patients' complex social context. This workshop offers GPs practical strategies and tools to put this into everyday practice.

ID 1361 - Breaking the silence: challenging misconceptions on family violence through trauma-informed and culturally sensitive care

Nina MONTEIRO [1] , Elena KLUSOVA NOGUINÁ [2], Joyce KENKRE [3], Jennifer NEIL [4], Hagit DASCAL-WEICHHENDLER [5], Nena GUCEK [6], Raquel GÓMEZ BRAVO [7], Fadzilah HANUM MOHD MYDIN [8], Kelsey HEGARTY [9], Leo PAS [10]

(1) Uls Santo António, Porto, Portugal,
(2) Samu061 Balearic Islands, Ibiza, Espagne,
(3) University Of South Wales, Cardiff, Royaume-Uni,
(4) Monash University, Melbourne, Australie,
(5) Clalit Health Services, Haifa, Israël,
(6) University Of Ljubljana, Ljubljana, Slovénie,
(7) Centre Hospitalier Neuropsychiatrique, Luxembourg, Luxembourg,
(8) Universiti Malaya, Kuala Lumpur, Malaisie,
(9) University Of Melbourne, Melbourne, Australie,
(10) Academic Center General Practice University Leuven, Leuven, Belgique

Context: In healthcare settings, misconceptions about family violence can hinder effective intervention and support for victims. Common myths include, but are not limited to, beliefs that victims can simply leave abusive relationships, or that it only occurs in certain socioeconomic groups. These myths perpetuate stigma, discourage disclosure, and lead to inadequate identification, treatment and referral. Family doctors play a critical role in challenging these misconceptions by recognizing that family violence is a public health issue affecting individuals across all demographics, and by providing trauma-informed care that prioritizes safety and empowerment.

Objectives: This interactive workshop aims to equip primary care professionals with practical tools and insights to identify and address misconceptions surrounding family violence. Participants will identify and critically examine common myths that influence clinical judgement and patient interactions, understand the impact of cultural and systemic factors on disclosure and response, apply trauma-informed and culturally sensitive approaches during consultations, and foster a healthcare culture of empathy, accountability and advocacy.

Teaching method and workshop: The session will use evidence-based, participatory methods. After a brief introductory session on common myths surrounding family violence, participants will break into small groups to analyse different case scenarios, with each group exploring how the myths influence responses and decision-making in

everyday consultations, as well as discuss solutions and counterarguments to the myths. The workshop will conclude with a plenary discussion, where insights and strategies for challenging these misconceptions will be shared and summarized. Workshop schedule: Introductory session, followed by small-group discussions moderated by the presenters. The workshop will end with a plenary session to share and summarize key insights and strategies.

Expected outcomes: By the end of the workshop, participants will be able to identify and challenge common myths and distinguish them from facts, while also being able to integrate evidence-based, culturally responsive and trauma-informed approaches into their clinical practice, to support victims and advocate for systemic change.

Conclusion: Correcting misconceptions about family violence in primary care settings is fundamental to advancing clinical competence and ensuring equitable, trauma-informed care for all patients.

ID 1382 - Cultural Influences on the Experience of Menopause

Yusianmar MARIANI BORRERO [(1)], Ines PEREIRA [(2)] , Laura RODRIGUEZ BENITO [(3)], Sara BELINCHON [(4)]

(1) Spital Clinic, London, Royaume-Uni,
(2) Chnp, Ettelbruck, Luxembourg,
(3) Benhill And Belmont Go Surgery, Sutton, Royaume-Uni,
(4) Quince De Mayo Health Centre, Madrid, Espagne

Context: Menopause is a universal biological transition, yet its meaning, symptom expression, and care-seeking behaviours vary widely across cultures. In many communities, menopause remains surrounded by stigma, silence, or misconceptions, shaping whether women report symptoms and how they interpret them. Some cultures view this life stage as a period of liberation or renewed identity, while others associate it with loss, shame, or medicalisation. For GPs—often the first point of contact—understanding these cultural influences is essential for providing individualized, equitable menopause care and moving beyond a one-size-fits-all model.

Objectives: Recognize how cultural beliefs shape the lived experience of menopause and influence symptom reporting. Identify barriers such as stigma, silence, and clinical knowledge gaps. Apply culturally sensitive, evidence-based approaches to assessment and treatment. Adapt communication strategies to validate women's diverse expectations and needs. Reflect on personal practice to improve inclusivity and equity in menopause care.

Teaching method and workshop: Interactive format featuring: Case-based scenarios demonstrating cross-cultural differences Group discussions: identifying blind spots and strategies. Integration of current evidence on stigma, taboos, and multicultural influences on menopause. Guided reflection to support culturally informed decision-making. Guided reflection on how to provide culturally responsive support and avoid homogenised treatment pathways. 5 min – Introduction: Framing menopause as a cultural and clinical issue for GP 30 min –Real-life cross-cultural scenarios involving stigma, and communication challenges. 15 min –Clinically oriented tools for culturally informed assessment, management, and patient empowerment. 10 min – Q&A

Expected outcomes: Participants will enhance their ability to deliver culturally sensitive menopause care, improve diagnostic clarity, and address barriers such as stigma and silence. They will gain practical strategies for patient-centred communication, shared decision-making, and individualized management, contributing to more equitable outcomes across diverse populations.

Conclusion: As GPs, we play a vital role in meeting women at a moment when cultural taboos or expectations may make it difficult for them to speak openly. This workshop strengthens both the clinical tools and the sensitivity needed to understand the diverse meanings menopause holds for each woman. By breaking the silence, honouring cultural context, and fostering empathetic communication,

Hospital, Ankara, Türkiye,
(4) Bulanık District Health Directorate, Mus, Türkiye,
(5) Umraniye Adem Yavuz Family Health Center, Istanbul, Türkiye,
(6) Gloucestershire Hospitals Foundation Nhs Trust. Rcgp Severn Faculty, England, Royaume-Uni,
(7) USF Carcavelos, ULS Lisboa Ocidental, Lisbon, Portugal, Lisbon, Portugal,
(8) Department of Family Medicine, Faculty of Medicine, Kahramanmaras Sutcu Imam University, Kahramanmaras, Turkiye, Kahramanmaras, Türkiye

Context: Artificial Intelligence (AI) is changing healthcare, but its integration into training remains uneven globally. This "digital divide" threatens equity in education of future doctors. While family physicians are expected to adopt these tools, we lack data on their actual proficiency and the availability of national training programs. To ensure technology serves humanism rather than replacing it, we must understand the current educational landscape.

Objectives: By the end of this session, participants will be able to: Self-assess their AI literacy and identify gaps in their national training curricula. Compare educational opportunities across different countries to highlight disparities. Propose core competencies required to maintain the doctor-patient relationship in an AI-driven digital era.

Teaching method and workshop: This session utilizes an interactive "Focus Group" methodology designed to foster fraternity and cross-border collaboration. Participants will be divided into small and diverse groups. Guided by facilitators, they will engage in structured dialogue, sharing personal experiences and national realities regarding AI-related education. Workshop schedule 00-05 min: Introduction: Setting the stage on AI in primary care. 05-35 min: Breakout focus groups: Participants discuss three key pillars: Personal proficiency, national educational opportunities, and perceived educational gaps. 35-45 min: Plenary synthesis: Group leaders present key findings; facilitators summarize common themes for future curriculum development.

Expected outcomes: Participants will gain a unique international perspective on AI readiness. The solid output will be qualitative data for a collaborative manuscript, giving voice to diverse national contexts. Additionally, this workshop aims to establish a network of educators committed to designing equitable, human-centric AI curricula for future family doctors.

Conclusion: We cannot let the digital revolution happen to us; we must shape it together. This workshop is a crucial step in building a united front to ensure that family medicine education remains equitable, competent, and deeply humanistic in the face of technological change.

(9) hospital General Universitario De Ciudad Real, Ciudad Real, Espagne,
(10) The Heart Institute" Of Cluj-Napoca, "iuliu Hatieganu" University Of Medicine And Pharmacy, Cluj-Napoca, Roumanie

Context: Point-of-care ultrasound (POCUS) is becoming an essential tool in primary care, enhancing diagnostic accuracy and improving clinical decision-making. However, many clinicians still feel insufficiently trained to use it confidently. This workshop uses a game-based approach to introduce key ultrasound concepts in an engaging and accessible way.

Objectives: By the end of the workshop, participants will be able to: - Recognize key POCUS findings relevant to primary care. - Understand basic probe handling and image interpretation principles. - Interpret ultrasound images from lung, abdominal, musculoskeletal, thyroid, ocular.... - Apply ultrasound reasoning to short clinical cases.

Teaching method and workshop: We use an interactive “Bingo Ultrasound” format. Participants are assigned to groups of 5–6 as they enter the room. Each group receives a bingo card with possible answers to 30 ultrasound-related questions, including images and clinical cases. A

central bingo drum reveals questions sequentially. The winning group is the first to complete their card and correctly justify all answers. If their justification is incorrect, play continues until a group achieves a fully correct card. Schedule 5 min: Introduction and room set-up 5 min: Instructions and automatic group formation as participants arrive 35 min: Bingo Ultrasound gameplay 10 min: Review of all questions, images, and clinical cases 5 min: Audience Q&A and closing remarks

Expected outcomes: Participants will increase their confidence in interpreting basic POCUS images, recognizing common findings, and applying ultrasound knowledge to clinical reasoning—all while experiencing the benefits of collaborative learning.

Conclusion: This dynamic, game-based workshop provides an enjoyable and memorable introduction to POCUS for primary care clinicians, reinforcing foundational skills through teamwork, problem-solving, and active engagement.

ID 1427 - Optimizing Medication in Frail Older Adults: Less Is More

Rocío GARCÍA-GUTIÉRREZ GÓMEZ [1] , Jesús RUÍZ RAMOS [2], Ana PERAL MARTÍN [3], Mary John-Charles ROBERTSON [4], Umber KHAN [5], Yanica VELLA [6], Anali CASAFRANCA REVOLLO [7], Selma KAYA [8], Miriam REY SEOANE [9], Carlos BALTAZAR [10]

(1) Semfyc, Madrid, Espagne,
(2) Hospital San Pablo, Barcelona, Espagne,
(3) Cs Paseo Imperial, Madrid, Espagne,
(4) rcgp Severn Faculty, Gloucestershire Hospitals Nhs Foundation Trust,, Bristol, Royaume-Uni,
(5) Shirley Health Partnership, Southampton, Royaume-Uni,
(6) Primary Health Care, Gzira, Malte,
(7) Hospital General Universitario De Ciudad Real, Ciudad Real, Espagne,
(8) Tokat Gaziosmanpaşa University, Tokat, Türkiye,
(9) Ics Barcelona / Cuap Manso, Barcelona, Espagne,
(10) Cs San Juan, Salamanca, Espagne

Context: Frail older adults frequently present with multimorbidity, polypharmacy and increased vulnerability to adverse drug events that complicate clinical decision-making and often lead to fragmented prescribing practices with limited re-evaluation of therapeutic goals. Optimizing pharmacotherapy requires a person-centred approach, careful assessment of functional and cognitive status, and the use of structured deprescribing tools. This workshop addresses these challenges through an interactive and practical format designed to strengthen clinical reasoning and safe medication review.

Objectives: 1. To improve participants' ability to assess frailty from a multidimensional perspective (physical, cognitive, functional and social). 2. To develop skills in identifying medication-related problems in older adults with polypharmacy. 3. To apply evidence-based tools for medication optimization, including STOPP/START, LESS-CROHN and MedStopper. 4. To enhance communication strategies for discussing treatment changes with patients and caregivers.

Teaching method and workshop: The workshop combines brief theoretical input with highly engaging interactive activities: -Icebreaker (5 min): Participants guess whether unusual drug names are real or invented, introducing the complexity of managing multiple medications. -Short theoretical introduction (10 min): Overview of frailty, risks of polypharmacy and key deprescribing frameworks. -Interactive Case 1 (20 min): Presentation of a frail older patient with multimorbidity. Using live polling (Kahoot or similar), participants identify barriers to adherence, medication-related risks and contextual factors to consider before adjusting treatment. -Interactive Case 2. Deprescribing decisions (20 min): Participants vote on whether to stop, adjust or initiate specific medications according to clinical information. Immediate feedback links each decision to STOPP/START, LESS-CROHN and MedStopper recommendations. -Communication strategies (5 min): Practical tips for explaining medication changes in a patient-centred and supportive manner.

Expected outcomes: By the end of the session, participants will be able to conduct a structured medication review in a frail older adult, recognize high-risk prescriptions, prioritize deprescribing decisions and justify changes based on functional status, therapeutic goals and evidence-based criteria. They will also strengthen their ability to communicate these changes effectively.

Conclusion: This workshop provides a concise, practical and interactive approach to optimizing pharmacotherapy in these patients. Through real-time clinical reasoning and evidence-based tools, participants gain confidence in simplifying treatment plans while enhancing safety and aligning care with what truly matters to each patient.

ID 1440 - Leading Wellbeing: Burnout as a Leadership Competency in Primary Care

Umber KHAN [(1)], M.I.M SHUJA [(2)] , Jörg SCHMID [(3)], Mary John-Charles ROBERTSON [(4)], Miriam Rey SEONE [(5)], Raisa Álvarez PANIAGUA [(6)], Ana Cristina Franco SPINOLA [(7)]

(1) Shirley Healthpartnership, Southampton, Royaume-Uni,
(2) Rajarata University Of Sri Lanka., Colombo, Sri lanka,
(3) German Climate And Health Alliance (klug, Munich, Allemagne,
(4) gloucestershire Hospitals Nhs Foundation Trust, Rcgp Severn Faculty, Bristol, Royaume-Uni,
(5) Ics Barcelona / Cuap Manso, Barcelona, Espagne,
(6) Seris (servicio Riojano De Salud) C.s. Cervera Del Río Alhama, Cervera Del Río Alhama, Espagne,
(7) Centro De Saúde Do Bom Jesus Sesaram Eperam, Ilha Da Madeira, Portugal

Context: Burnout is becoming a growing concern across primary care, affecting clinicians, managers and leaders alike. Too often it's treated as a personal weakness or an individual responsibility, when in reality it reflects wider pressures in the system: rising demand, constant change, emotional labour and the strain of carrying multiple roles. This workshop offers a different perspective. It reframes wellbeing as a leadership competency, not a personal luxury, and invites leaders to look honestly at how team culture, workload, autonomy / fairness influence burnout across a whole practice including themselves.

Objectives: This workshop aims to help leaders understand burnout as a shared system issue rather than an individual deficit. Use Liberty, Equality and Fraternity to explore how autonomy, fairness and team cohesion protect or erode wellbeing. Build leaders' confidence to recognise early signs of burnout, hold supportive conversations and shape healthier work environments.

Teaching method and workshop: The session integrates short reflective tasks, paired dialogue, diagnostic tools and applied leadership exercises. Participants work with real-world scenarios, share experiences and generate practical strategies that can be implemented within their teams.0–10 min Welcome :Introductions and a shared definition of burnout. Leaders briefly reflect on how the principles of Liberty, Equality and Fraternity appear in their daily workload and leadership practice.10–25 min Mapping Hidden Drivers:Small groups map contributors to burnout—initiative overload, workload, administrative burden, emotional labour and reduced autonomy/ identify which pressures are most significant in their own settings.25–40 min **Recognising and Responding:** Case-based activities to identify early signs of burnout and practise communication techniques for enabling psychologically safe wellbeing conversations.40–55 min Action Planning:Development of personal, team/system-level strategies such as digital boundaries, fair workload allocation, improved meeting practices and resilience routines.55–60 min Reflection and Commitment:Participants identify one leadership behaviour to implement over the next month.

Expected outcomes: articipants will leave with greater insight into the systemic nature of burnout, improved skills in recognising and addressing it early, and concrete tools to create a fairer, safer and more cohesive team culture.

Conclusion: This workshop encourages leaders to treat wellbeing as a core part of leadership. By protecting autonomy, fairness and connection, we can build primary care teams that are resilient, sustainable and genuinely human-centred.

ID 1448 - Experiencing Narrative Medicine: Enhancing Patient-Centered Care, Reflexivity and Well-being in General Practice

Alix FERNET-SCHERER [(1)] , Marielle PUECH [(1)], Emilie FORT-ORTET [(2)], Solène BLANCHIN [(3)]

(1) 1department Of Family Medicine, Toulouse, France,
(2) Iut Bordeaux Montaigne, Bordeaux, France,
(3) 1department Of Family Medicine, Grenoble, France

Context: Narrative Medicine (NM), conceptualized by Rita Charon at Columbia University, is an innovative interdisciplinary approach that centers on the patient's illness experience through storytelling. By cultivating narrative competence—the ability to recognize, absorb, interpret, and be moved by patients' stories—NM complements traditional evidence-based medicine. Systematic reviews have demonstrated its benefits, including increased empathy, reflexivity, interprofessional connection, and prevention of burnout. Although widely implemented in hospital settings, NM remains underutilized in primary care, however holistic, patient-centered models predominate and clinician resilience is paramount. This workshop draws on four years of experience delivering NM training to medical students.

Objectives: This workshop aims to: Strengthen general practitioners' soft skills through experiential

engagement with NM's three-phase method. Raise awareness about NM's formative effects, including attentive listening, interpretation, empathy, relational ethics and reflexivity. Share effective tools for establishing NM workshops in primary care settings.

Teaching method and workshop: The workshop employs an active, experiential, and reflective approach structured around NM's three-part pedagogy: close reading of a literary text, guided reflective or creative writing, and text sharing. 1. Introduction 2. Interactive brainstorming (word cloud) eliciting responses to "What helped you develop relational and communication skills during medical school?" and "What was missing in your relational and communication skills training?" 3. Active participation in a characteristic NM workshop involving literary reading, guided writing, and voluntary sharing. 4. Group reflection exploring how the experience influences clinical practice, patient-provider relationships, and professional identity, fostering sustainable integration of narrative skills. 5. Theoretical input on narrative skills : attention, interpretation, emotional awareness, affiliation, empathy... 6. Practical tools for implementing NM workshops in participants' institutions.

Expected outcomes: Participants will gain first-hand experience of NM, recognize its formative impact, and acquire concrete resources and strategies for integrating narrative pedagogy into their practice.

Conclusion: Integrating Narrative Medicine into medical practice supports the development of critical clinical skills for general practionners, grounded in humanity, ultimately fostering more empathetic, reflective, and resilient healthcare professionals.

ID 1461 - Contraception for All: Improving Access and Equity for Vulnerable Groups in Primary Care

Sofia BENTO, Manuel LOPES-CARDOSO, Catarina MIRANDA-LOURENÇO, Carolina SILVA, Madalena WOLF CARVALHO

Unidade Local De Saúde De São José, Lisboa, Portugal

Context: Across Europe, inequities in contraception access persist, particularly among vulnerable groups who face medical, socioeconomical and cultural barriers. Family doctors are uniquely positioned to bridge these gaps by providing patient-centred, non-judgmental, and inclusive contraceptive care. This workshop offers participants the opportunity to engage with real-life challenges and explore practical strategies for improving contraceptive counselling for vulnerable populations.

Objectives: Identify key barriers to contraceptive access among vulnerable groups, including adolescents, migrants and refugees, people experiencing homelessness, LGBTQIA+ community, and women with chronic illness or disability. Apply communication tools and culturally sensitive counselling approaches to tailor contraceptive discussions to individual needs. Develop practical, context-appropriate interventions to support equitable contraceptive access in their own clinical settings. Reflect on the role of the family doctor in advancing reproductive justice and reducing health inequities.

Teaching method and workshop: The workshop will use interactive, participant-centred pedagogic methods, including: 1. A short introductory presentation summarising evidence on contraceptive inequities in Europe and possible strategies to overcome it. 2. Small-working-groups focused on specific vulnerable groups. 3. Case-based discussions with clinical scenarios highlighting common dilemmas. 4. Facilitated group reflection and plenary feedback to consolidate learning. Workshop schedule (60 minutes): 1. Welcome and introduction (10 minutes) Overview of contraceptive inequities in Europe and possible strategies to overcome it; Workshop objectives and structure; Division in small-working-groups. 2. Small-working-groups and case discussion (25 minutes) Discuss barriers specific to a vulnerable group; Work through a brief case scenario; Identify strategies for improving access and counselling. 3. Plenary sharing (15 minutes) Each group presents key insights and proposed strategies (2-3 minutes per group); Moderators highlight common themes and innovative approaches. 4. Conclusion (10 minutes) Take-home messages and practical tips for clinical practice; Q&A.

Expected outcomes: Participants will leave the session with: Improved understanding of the diverse contraception needs of vulnerable groups. Practical counselling tools and adaptable strategies to support person-centred contraceptive decision-making. Increased confidence in addressing sensitives issues and overcoming structural barriers. Actionable ideas for enhancing contraceptive access.

Conclusion: This workshop empowers participants to deliver equitable, respectful, and context-aware

contraceptive care. Participants will gain the skills and insight needed to reduce disparities, strengthen patient autonomy, and promote reproductive health for vulnerable populations.

ID 1463 - Bias Busters: Leading with Awareness in Primary Care

Umber KHAN [(1)], M.I.M SHUJA [(2)] , Ana Cristina Franco SPINOLA [(3)], Jörg SCHMID [(4)], Marisa João Horta FERREIRA [(5)], Mary John-Charles ROBERTSON [(6)], Paula Sala IVARS [(7)], Pedro FERREIRA [(8)]

(1) Shirley Healthpartnership, Southampton, Royaume-Uni,
(2) Rajarata University Of Srilanka, Colombo, Sri lanka,
(3) Centro De Saúde Do Bom Jesus Sesaram Eperam, Iih Da Madeira, Portugal,
(4) German Climate And Health Alliance (Klug), Munich, Allemagne,
(5) Ucsp Alcocochete-Uls Arco Ribeirinho, Alcochete, Portugal,
(6) Severn Faculty Rcgp, Gloucestershire Hospital, Bristol, Royaume-Uni,
(7) University Of Valencia, Valencia, Espagne,
(8) Usf Noca Caparica, Portugal, Portugal

Context: We like to believe we make fair, objective decisions as leaders — but unconscious bias has a way of slipping into our thinking without us realising it. In primary care, these hidden assumptions can shape team dynamics, influence opportunities, and even affect patient care. Bias isn't a sign of bad character; it's simply how human brains work. The real leadership challenge is learning to notice it and minimise its impact. When we don't, autonomy, fairness and team cohesion can quietly erode. This workshop frames bias as an essential leadership competency, not a personal flaw, and invites leaders to explore how awareness and reflective practice can strengthen both teams and patient outcomes.

Objectives: This workshop aims to:Help leaders recognise unconscious bias as a natural cognitive process with real consequences.*Use **Liberty, Equality and Fraternity** to explore how bias affects autonomy, fairness and team cohesion.*Build leaders' confidence in using practical tools to reduce bias and promote inclusive, psychologically safe teams.

Teaching method and workshop: Participants engage in interactive games, case-based discussions and reflective exercises, including optional Implicit Association Tests. We explore real-life scenarios from clinical and leadership settings and introduce simple habits inspired by the *7 Habits of Highly Effective GPs* to support ongoing self-awarenes Workshop Schedule (1 hour)0–10 min — Introduction: welcome, why bias matters in leadership, and brief reflection on personal values. 10–25 min — Bias in Action:Interactive activities +/- quick scenarios that reveal how bias appears in everyday decisions. (IA Test use) 25–40 min — Leadership Conversations:Small groups explore how to respond to situations involving bias, using active listening, reflective questioning and inclusive communication. 40–55 min — Action Strategies:Developing practical steps to reduce bias in team meetings, recruitment, supervision, clinical decision-making and workload distribution. 55–60 min — Takeaways:Individual commitment/ Reflection+ closing.

Expected outcomes: Participants will leave with greater awareness of their own biases, practical tools to reduce their impact, and improved confidence in leading fairer, safer and more inclusive teams.

Conclusion: Unconscious bias isn't something we eliminate — it's something we learn to manage. This workshop helps leaders approach bias with honesty, curiosity and compassion, strengthening trust, fairness and cohesion at the heart of primary care.

ID 1464 - Ethics and Decolonising Principles in Global Health

Lisa ZANGARINI [(1)] , Shrey MATHUR [(2)], Jörg SCHMID [(3)], Umber KHAN [(4)], Kerry GREENAN [(5)], Aliki TRAIANOU [(6)], Mohamed SHUJA [(7)], Catarina GOMES MADEIRA [(8)], Nick MAMO [(9)]

(1) Faculty Of Science, Technology And Medicine, University Of Luxembourg, Esch Sur Alzette, Luxembourg,
(2) Queen Mary University Of London, London, Royaume-Uni,
(3) German Climate And Health Alliance (klug), Munich, Allemagne,
(4) Shirley Health Partnership, Southampton, Royaume-Uni,
(5) Bromley-By-Bow Health Partnership, London, Royaume-Uni,
(6) University Of Glasgow, Glasgow, Royaume-Uni,
(7) Faculty Of Medicine And Allied Sciences, Rajarata University Of Sri Lanka., Anuradhapura, Sri lanka,
(8) Escola Nacional De Saúde Pública, Lisbon, Portugal,
(9) Nhs Lanarkshire, Hamilton, Royaume-Uni

Context: Global Health is an area of interest for many family doctors, especially early-career clinicians, but it raises several ethical concerns, often rooted in the power imbalance between the

'Global North' and 'Global South' during a transitional period for the field. Key challenges include voluntourism, inadequate contextual understanding, weak sustainability, and epistemic injustice. These issues are intensified by insufficient inclusion of the affected community in research and health services, resulting in interventions that are not appropriately aligned with their actual needs.

Objectives: To exchange experiences and develop an ethical, decolonized understanding of working within Global Health contexts, including considerations of sustainability, while fostering critical reflection on one's own role to minimise biases and avoid common pitfalls.

Teaching method and workshop: This workshop will be run by the EYFDM SIG for Global Health. There will be a short presentation on the principles of decolonisation medicine and examples of co-production with communities, followed by facilitated group discussions of these themes anchored around case scenarios. Groups will be asked to respond to scenarios and ethical challenges when working in such settings in clinical, research and technical capacities both locally and internationally. This will be an interactive World Café-style workshop, making use of surveys, word-clouds, and small-group discussions. To invite contributions from a diversity of voices, participants will be encouraged to share from their experiences working in global health. The final part of the workshop will share the outcomes of these discussions and agree overarching principles.

Expected outcomes: 1. Gain a broader understanding of ethical principles relevant to working in Global Health 2. Share experiences, reflections, and lessons learned from both successful practices and challenges encountered in these settings 3. Develop skills in applying decolonising approaches 4. Foster a spirit of equitable co-production and solidarity with local communities.

Conclusion: This workshop aims to facilitate important dialogue on the principles of solidarity and equity during a transitional time in Global Health with sharing of diverse perspectives and reflections on ethical considerations.

ID 1470 - Advocating for People-Centred Primary Care: A Practical Workshop for Clinicians

Raquel GÓMEZ BRAVO [1], María Pilar ASTIER PEÑA [2], Marina GUISADO CLAVERO [3], Charlotte MORRIS [4], Ana Luisa NEVES [5], Nick MAMO [6], Andree ROCHFORT [7], Alex HARDING [8], Sara ARES BLANCO [9], Policy Advocacy COLLABORATIVE GROUP [10]

(1) Centre Hospitalier Neuro-Psychiatrique, Luxembourg, Luxembourg,
(2) Universitas Health Centre, Zaragoza, Espagne,
(3) Investigation Support Multidisciplinary Unit For Primary Care And Community North Area Of Madrid, Madrid, Espagne,
(4) Nihr School For Primary Care Research, Department Of Primary Care And Health Services Research, The University Of Manchester, Manchester, Royaume-Uni,
(5) Department Of Primary Care And Public Health, Imperial College London., London, Royaume-Uni,
(6) Department Of Psychiatry, University Of Groningen, University Medical Center Groningen, Groningen, Pays-Bas,
(7) Quality Improvement, Irish College Of General Practitioners, Dublin, Irlande,
(8) University Of Exegery, Exeter, Royaume-Uni,
(9) 8federica Montseny Healthcare Center, Unidad De Investigación, Gerencia Asistencial De Atención Primaria, Madrid, Espagne,
(10) European Alliance Of Primary Care Workforce Development, Brussels, Belgique

Context: Effective policy advocacy is essential for strengthening primary care and shaping sustainable, integrated, people-centred health systems. Yet many primary health care (PHC) physicians and organisations lack structured training in navigating policy processes or leveraging their frontline expertise to influence decision-making. This workshop responds to this gap by equipping primary care stakeholders with practical competencies to engage in evidence-informed advocacy across local, national and European contexts.

Objectives: The workshop aims to enable participants of the workshop to: (1) understand key policy-making mechanisms that affect PHC;(2) identify policy windows and advocacy opportunities linked to access, equity and system integration; and (3) develop a tailored and actionable advocacy plan that reflects their organisational realities and the conference's focus on system strengthening.

Teaching method and workshop: The workshop uses a mix of short presentations, case examples and hands-on group work. 0–10 min: Introduction to policy advocacy and overview of simple policy-making models. 10–20 min: Presentation of two short real-world primary care advocacy examples

from Europe. 20–45 min: Small-group exercise: participants map a relevant challenge in their own context, identify key stakeholders, define an advocacy objective and draft three core messages. 45–55 min: Groups share their mini advocacy plans and receive rapid peer feedback. 55–60 min: Summary, key take-home tools and invitation to continue informal networking during the conference.

Expected outcomes: Participants are expected to leave the workshop with: - A clearer understanding of how policy processes influence primary care organisation and equity. - Practical introductory tools for stakeholder mapping, message framing and defining advocacy objectives. - A short draft advocacy plan that can be further developed after the conference. - Increased confidence to engage with policymakers, professional associations or local health system leaders.

Conclusion: This concise, interactive workshop offers primary care professionals a straightforward entry point into policy advocacy. By focusing on practical tools and peer exchange, it supports participants in becoming more effective voices for strong, equitable and people-centred primary care systems across Europe.

ID 1493 - Engaging patients and the public in co-designing a vision for primary care

Tara KIRAN [(1)], Neb KOVACINA [(2)] , Amanda CONDON [(3)]

(1) University Of Toronto And St. Michael's Hospital, Toronto, Canada,
(2) Mcgill University, Montreal, Canada,
(3) University Of Manitoba, Winnipeg, Canada

Context: Across countries, primary care systems face pressures related to access, continuity, and equity. Yet reforms often proceed without deeply engaging the people most affected: patients and communities. In Canada, OurCare—a 16-month national public-engagement initiative involving nearly 10,000 people—co-designed a shared vision for high-quality, equitable primary care. The resulting OurCare Standard has influenced provincial and national reforms, including Ontario's new Primary Care Act. This workshop will share lessons from the OurCare process and invite participants to explore how similar deliberative and community-based approaches could be adapted to their national or regional settings.

Objectives: By the end of the session, participants will be able to: 1. Describe key components of a large-scale public-engagement process in primary care. 2. Identify strategies for involving diverse communities—including marginalized and underrepresented groups—in co-design. 3. Reflect on how public priorities can shape system reform. 4. Adapt elements of the OurCare model to their local, regional, or national settings.

Teaching method and workshop: The workshop will combine a structured presentation with facilitated discussion and brief paired activities. Participants will be introduced to the three phases of the OurCare process—national survey, priority-setting panels, and community roundtables—and then guided to reflect on how elements of each phase could translate to their settings. Worksheets will support participants in identifying opportunities, barriers, and design considerations for meaningful public engagement. 0–25 min: Overview of the OurCare initiative, including the three phases and resulting policy impact. 25–45 min: Paired and small-group reflection on adapting engagement approaches within participants' settings. 45–60 min: Plenary discussion, resource sharing, and identifying next steps.

Expected outcomes: Participants will gain an understanding of practical methods to support meaningful patient and public engagement, along with draft ideas they can use to design or strengthen similar processes in their own jurisdictions.

Conclusion: Public engagement is essential to building primary care systems that reflect community priorities and values. This workshop will equip participants with practical strategies and tools to involve patients and the public in shaping a shared vision for the future of primary care.

ID 1496 - Free, competency-based Preventive & Lifestyle Medicine learning resources for our and our planet's health

Andrea SALIBA [(1)], Erica FRANK [(1)] , Miriam CHICKERING [(2)], Ozden GOKDEMIR [(3)], Lilach MALATSKEY [(4)], Ifeoma MONYE [(5)]

(1) university Of British Columbia, Vancouver, Canada, Vancouver, Canada,
(2) Nextgenu.org, Bethel Minnesota, États-Unis,
(3) World Lifestyle Medicine Organization, Immediate Past Chair, Wonca Working Party On Planetary Health, Izmir, Türkiye,

(4) World Lifestyle Medicine Organization, Safed, Israël,
(5) World Lifestyle Medicine Organization, Abuja, Nigéria

Context: Chronic and lifestyle-related diseases are increasing worldwide, yet most health professionals receive limited training in Preventive and Lifestyle medicine. Would-be preventionists, particularly in low-resourced settings, face significant challenges: limited instructor capacity, high curriculum development or purchase costs, and a lack of harmonized competencies aligned with global accreditation frameworks. Drawing on an international collaboration guided by the Global Forum for Preventive, Community, and Public Health Medicine and the World Lifestyle Medicine Organization, we developed an openly accessible, high-quality hybrid curriculum aligned with global and regional competencies. This workshop introduces this model (a different approach to OneHealth) and helps participants apply it (personally and institutionally).

Objectives: Describe competency-based Preventive & Lifestyle Medicine curricula and their alignment with international standards. Identify strategies for locally adapting a modular curriculum using open-access educational resources. Map personal, trainee, and/or institutional training needs to core competencies in preventive and lifestyle medicine. Draft an initial hybrid training model within their own educational/clinical settings. Evaluate key components required for accreditation alignment, mentorship, and community-based practicum integration.

Teaching method and workshop: The workshop combines short presentations, small-group discussions, hands-on exercises in curriculum development, peer exchange, and an introduction to the updated NextGenU.org open-access course repository and crosswalk tools. Workshop Schedule 5 min – Welcome and Introductions 10 min – Icebreaker Activity 10 min – Presentation 1: Global burden, learning desires/gaps, competency frameworks. 5 min – Presentation 2: Curriculum architecture, crosswalk methodology, hybrid model. 10 min – Small Group Discussions: Learners, content priorities, local barriers, accreditation. 7 min – Exercise Part 1: Drafting a learning pathway; paired feedback. 10 min – Exercise Part 2: Implementation planning and first steps. 3 min – Closing & Next steps.

Expected outcomes: Participants will leave with a draft adaptable curriculum, familiarity with freely available competency-aligned modules, improved confidence in aligning training with global standards, and a preliminary implementation plan suited to their institution or national context.

Conclusion: This workshop demonstrates a practical, scalable, and equity-oriented approach to building Preventive & Lifestyle Medicine capacity. By integrating global competencies with local relevance, open-access learning, and community-embedded practicum models, individuals can equitably learn, and institutions can accelerate workforce development.

ID 1497 - Communicating a Dementia Diagnosis in Primary Care: Turning a Difficult Moment into a Skilled Conversation”

Marie Thérèse LUSSIER [(1)] , Claude RICHARD [(2)], Isabelle VEDEL [(3)], Yves COUTURIER [(4)]

(1) Université De Montréal, Montreal, Canada,
(2) Cisss Laval, Laval, Canada,
(3) Mc Gill University, Montreal, Canada,
(4) Université Sherbrooke, Sherbrooke, Canada

Context: The prevelence of dementia is increasing in western societies and it is associated with a high disease burden. The disclosure of a dementia diagnosis during a clinical counsultation brings with it a great deal of discomfort and anxiety for patients, their loved ones, and also for primary care (PC) physicians, who often feel ill-equipped to address such a sensitive subject. Rigorous communication approaches have been developed to lessen the devastating impact of delivering bad news and ensure that the clinical consultation proceeds smoothly. The SPIKES approach to doctor-patient communication is particularly useful for structuring the stages of an interview to disclose a dementia diagnosis.

Objectives: -Discuss the barriers related to the environment, the provider, or the patient that hinder a smooth disclosure of a dementia diagnosis. -Apply specific strategies to mitigate these barriers during clinical encounters involving the disclosure of a dementia diagnosis. -Conduct these disclosure conversations following the steps of the SPIKES model, adapting one’s communication style to the characteristics of the illness, the patient’s and caregiver’s sociocultural background and preferences.

Teaching method and workshop: Short theoretical presentation; Wooclap interactive session; guided role-play WORKSHOP SCHEDULE:

0:00 – 0:05 (5 min) Welcome & Brief overview of workshop goals 0:05 – 0:15 (10 min) Experience Sharing & Framing the Challenge with disclosing a dementia diagnosis/Why communication matters in this context 0:15 – 0:25 (10 min) Key Barriers in Dementia Diagnosis Disclosure/ Brief strategies to overcome these barriers 0:25 – 0:35 (10 min) Core Principles of the SPIKES Model 0:35 – 0:52 (17 min) Clinical Case – Guided Role Play/Short scenario/Participants take turns practicing key steps of the model/Focus on communication techniques rather than diagnostic reasoning 0:52 – 1:00 (8 min) Key Take-Home Messages & Workshop Evaluation/Summary of practical strategies/Participant feedback.

Expected outcomes: Participants will better identify the practical steps they need to follow when disclosing a dementia diagnosis and the common pitfalls they need to avoid to lessen the choc of being diagnosed with such a chronic debilitating disease.

Conclusion: Improving primary care providers' specific communication skills to deliver this type of bad news will contribute to a more positive patient experience of this difficult moment.

ID 1528 - Making Artificial Intelligence (AI) an Ally, Not an Autopilot: A Practical DEFT-AI Approach for GP Educators

Isabelle GÉRARD, Arabelle RIEDER, Johanna SOMMER

Family Medicine Department Geneva University, Geneva, Suisse

Context: During clinical placements in general practice, medical students increasingly turn to artificial intelligence tools to support diagnostic reasoning, information retrieval and communication tasks. This behavior often emerges spontaneously, without explicit guidance. For supervising clinicians, this creates both uncertainty and opportunity: AI can enrich learning, but it may also undermine critical thinking, confidentiality or professional judgement if used without structure.

Objectives: This workshop aims to: • raise awareness among teaching physicians about the educational potential of AI during clinical rotations; • introduce the DEFT-AI method (Discussion, Evidence, Feedback, Teaching, AI-engagement recommendations) as a practical supervisory framework to transform students' unstructured use of AI into a safe, meaningful learning process; • apply this method to a concrete clinical scenario to support hands-on understanding and adoption.

Teaching method and workshop: The session will begin with a brief overview of the ways students may use AI during clinical encounters (5'). This will be followed by an explanation of the DEFT-AI approach, recently proposed in the medical education literature, as a supervisory tool to help students use AI appropriately in general practice settings (10'). Participants will then be presented with a vignette involving a patient, a medical student using AI during the consultation, and a supervising physician (5'). In small groups, participants will engage in role plays applying the DEFT-AI framework to guide the student's use of AI (30'). The session will conclude with a whole-group debrief to share perceptions and reflect on the strengths, challenges, and feasibility of using DEFT-AI in real practice (10').

Expected outcomes: Participants will gain familiarity with the DEFT-AI method, which provides clinicians with a reproducible structure for supervising AI use without requiring technical expertise and while preserving student autonomy. By offering a transparent and shared framework, the workshop demonstrates how well-supervised AI engagement can reinforce liberty in clinical reasoning, equity in access to learning resources and fraternity in collaborative practice.

Conclusion: This session equips supervising physicians with practical tools to integrate AI into a safe, reflective and shared teaching process. Participants will leave with concrete skills to apply directly when they next supervise a student or intern.

(9) Social Prescribing And Community Orientation Wonca Europe Special Interest Group/department Of Preventive Medicine, Charles University, Medical Faculty In Hradec Králové, Czech Republic.czech Gp Society, Prague, Czech Republic, Prague, Tchéquie,
(10) Social Prescribing And Community Orientation Wonca Europe Special Interest Group/local Health Unit Of Trás-Os-Montes And Alto Douro.portuguese Association Of General And Family Medicine., Trás-Os-Montes And Alto Douro, Portugal

Context: In recent years, social prescribing has gained increasing attention as a practical way to address factors that shape health outside the health care, such as loneliness, financial hardship, limited social networks, and the daily challenges of living with multiple illnesses. However, the growing interest is not directly proportional to the growth of social prescribing, nor is its spread across Europe. Many clinicians are unsure where to start, what models are available, or how strong the evidence is. This workshop is designed to help practitioners move from broad ideas to workable solutions.

Objectives: The workshop aims to give participants: A clear understanding of the main concepts and theoretical underpinnings of social prescribing. An overview of current evidence, including benefits and the challenges of evaluating outcomes. Practical strategies for building social prescribing into routine practice.

Teaching method and workshop: Introduction (10 min): Framing social prescribing within primary care and population health. Evidence and models (10 min): Brief overview of definitions, theoretical underpinnings, and standard delivery models. Case-based group work (25 min): Participants work in small groups on patient scenarios to design social prescribing pathways in their context. Plenary debrief (10 min): Sharing examples, barriers, and facilitators identified during group work. Action planning and wrap-up (5 min): Participants outline one or two concrete next steps to advance social prescribing at home.

Expected outcomes: Participants will gain a clearer conceptual understanding of social prescribing and how it fits within holistic, person-centred primary care. They will leave with practical ideas, simple tools, and draft local pathways that can be further developed with colleagues and community partners. The workshop aims to strengthen participants' confidence in initiating or scaling up social prescribing initiatives in their own health systems.

Conclusion: Social prescribing offers a concrete way to translate the rhetoric of holistic, community-oriented primary care into everyday practice. By connecting patients with meaningful social and community resources, clinicians can address root causes of poor health and support more sustainable care. This workshop seeks to move social prescribing from theory to real life by equipping participants with knowledge, inspiration, and practical starting points for action.

(2) Wonca Working Party On Mental Health. University Of Economics, Faculty Of Medicine, İzmir, Izmir, Türkiye,
(3) Wonca Working Party On Mental Health. Lab Of Health And Society, School Of Medicine, University Of Crete, Greece And Dept. Of Psychology, University Of Limassol, Cyprus, Heraklion, Grèce,
(4) Wonca Working Party On Mental Health. Biobizkaia Health Research Institute, Basque Country, Spain And

Ikerbasque Basque Foundation For Science, Basque Country, Espagne,
(5) Wonca Working Party On Mental Health. Community, And Mental Medicine, Eastern Province, Arabie Saoudite,
(6) Wonca Working Party On Mental Health/cimf Working Party On Mental Health, Primary Health Care Department, School Of Medicine, Federal University, Rio De Janeiro, Brésil

Context: Professional burnout among primary care physicians has reached critical levels, posing a threat to clinicians' well-being, patient safety, and the sustainability of the healthcare system. Emotional exhaustion, depersonalization, and reduced professional accomplishment are increasingly reported, driven by excessive workload, administrative burden, and limited professional autonomy. Despite widespread recognition of the problem, responses remain fragmented, and preventive strategies are often confined to individual coping interventions rather than systemic reform.

Objectives: To identify key risk factors and manifestations of professional burnout in primary care. To explore its association with compassion satisfaction and compassion fatigue. To discuss the theoretical framework of the so-called socio-affective training To explore evidence-based organisational interventions that mitigate burnout and strengthen workforce resilience. To design practical, scalable strategies for integrating mental health promotion into everyday primary care practice and policy.

Teaching method and workshop: Interactive discussions will be combined with short evidence summaries and small-group exercises. Participants will engage in case-based scenario analysis, guided reflection, and collaborative problem-solving. The workshop will also utilise a structured "system mapping" tool to visualise the links between policy, organisational culture, and physician well-being. Workshop schedule Introduction (10 min): Framing burnout as a system-level challenge. Evidence briefing (10 min): Review of prevalence, drivers, and successful interventions. Group work (25 min): Participants co-develop feasible strategies for their national or institutional contexts. Debrief and synthesis (10 min): Sharing key insights and barriers. Wrap-up (5 min): Summary and actionable takeaways.

Expected outcomes: Participants will acquire practical frameworks and policy tools to address professional burnout through organisational and system-level interventions. They will leave with draft action plans adaptable to national contexts and access to a shared resource repository.

Conclusion: This workshop reframes professional burnout as a collective, systemic issue requiring coordinated leadership, supportive organisational structures, and cross-sector collaboration. By shifting focus from individual resilience to institutional accountability, it aims to empower primary care professionals to drive sustainable change in workforce well-being.

ID 1567 - POCUS in European Primary Care: Policies, Practices, and Perspectives — A Delphi-Based Interactive Workshop

Virginie DUMONT, Jeoffrey SEGURA, Lucas PAQUE, Alexandre ALESSI

Université De Liege, Liège, Belgique

Context: Point-of-care ultrasound (POCUS) is increasingly used in primary care across Europe, yet significant variations persist in training pathways, certification systems, reimbursement mechanisms, and clinical adoption. A working group of the European Federation of Societies for Ultrasound in Medicine and Biology (EFSUMB) recently conducted a comparative analysis identifying ultrasound examinations that can be performed in primary care and prioritising those most relevant for general practitioners (GPs). Whether these expert-derived priorities align with real-world practice remains unclear.

Objectives: This workshop aims to: - Present a comparative overview of POCUS implementation across Europe. - Capture participants' practical experience and perceived needs through interactive polling. - Compare frontline perspectives with the EFSUMB analysis using a Delphi-inspired discussion.

Teaching method and workshop: The session consists of three interactive parts: Part 1 — European POCUS Landscape: Short presentations by multiple speakers outlining national models for training, certification, and reimbursement. Part 2 — Participant Experience (Wooclap): Live polling to assess current POCUS use, priorities, barriers, and expectations of attending GPs. Part 3 — Delphi Confrontation: Small-group and plenary discussions contrasting participants' views with EFSUMB expert conclusions to identify convergences and divergences. While the workshop will be delivered in French, Part 3 may be conducted in English to enable a wider and richer debate.

Expected outcomes: The workshop will highlight areas where expert recommendations align—or

not—with the realities of primary care. It will identify POCUS applications perceived as most valuable by GPs, reveal gaps in training and system organisation, and provide insights to support more coherent European strategies.

Conclusion: By combining European comparative data, participant feedback, and a Delphi-inspired exchange, this workshop will generate practical guidance for strengthening the integration of POCUS in general practice and informing future European recommendations.

ID 1608 - Exploring the Strengths of Family Medicine (Education) across Europe using Rich Pictures

Florence DEN BOER [1] , Karolina BRAUN [2], Judy VAN ES [1]

(1) Amsterdam University Medical Center, Amsterdam, Pays-Bas,
(2) Leiden University Medical Center, Leiden, Pays-Bas

Context: WONCA is a unique platform to exchange ideas and knowledge with colleagues from diverse backgrounds. Such meetings foster mutual learning, professional growth, and provide opportunities to showcase research methods as practical tools, ultimately with the goal of improving patient care. This workshop highlights the value of collaboration and personal interaction in advancing Family Medicine.

Objectives: Learn from the strengths of different countries in the practice of Family Medicine Inspire and share ideas amongst colleagues Demonstrate qualitative research methods

Teaching method and workshop: We will use the Rich Pictures method, followed by group analysis techniques: interviewing, discussion, and a gallery walk. Participants will draw an image representing the strengths of Family Medicine care and training in their country. Rich Pictures, rooted in Systems Engineering, help visualize experiences by revealing tacit insights and interactions [1,2]. Next, participants interview each other in small groups about their drawings, guided by prompts in the introduction. Depending on time, we will facilitate either a Gallery Walk or a group discussion. Gallery Walks allow participants to explore all drawings, identify similarities and differences, and connect themes [3]. In the group discussion, we will focus on the strengths of Family Medicine across countries, aiming to inspire each other positively. **Schedule:** Introduction of team and methodsDrawing Rich Pictures individually Interviewing in small groups Gallery Walk: analyzing all images collectively Group discussion References1. Cristancho SM, Helmich E. Rich pictures: a companion method for qualitative research in medical education. Med Educ. 2019;53(9):916–24. 2. Armson R. Drawing rich pictures. In: Growing wings on the way: systems thinking for messy situations. Axminster: Triarchy Press Limited; 2011 3. Cristancho S, Bidinosti S, Lingard L, Novick R, Ott M, Forbes T. Seeing in different ways: introducing “rich pictures” in the study of expert judgment. Qual Health Res. 2015;25(5):713–25.

Expected outcomes: Participants will become acquainted with qualitative research methods whilst sharing knowledge. The workshop encourages discussing positive aspects of Family Medicine and specialty training, fostering collaboration and inspiration.

Conclusion: We aim to promote the spirit of Fraternité from this year’s theme among Family Medicine professionals. Nous espérons bénéficier de cette opportunité et vous remercions de l’attention portée à notre contribution.

ID 1611 - Drama Proof your Life in General Practice and Beyond

Caryn SIMMS [1] , Michael BLACKMORE [2], Stephanie HANNAH [3]

(1) Rcgp Scotland, Glasgow, Royaume-Uni,
(2) Rcgp Scotland, Stirling, Royaume-Uni,
(3) Rcgp Scotland, Edinburgh, Royaume-Uni

Context: Join us for this fun, interactive transformational coaching session to explore the Drama Triangle and reframe to the Winner's Triangle. The Drama Triangle is a psychological model of human behaviour describing dysfunctional interactions and roles within relationships or conflict with recurring destructive patterns. It is a subconscious game of power with three primary roles: victim, rescuer and persecutor. Everyone in the triangle is stuck, moving perpetually between all these roles. Drama triangles are relevant in primary care arising frequently in consultations and team interactions. Research shows that it diminishes performance, wastes time and energy, over-investigation, compassion fatigue, blurred boundaries, co-dependency, negative impact on practice culture and leads to burnout.

Objectives: Learn about the relevance, impact and consequences of the Drama Triangle in Primary Care and why medics have an affinity to the rescuer role and how to change this. Identify Drama Triangles and learn practical strategies to escape and avoid entering, taking the bait or hooking others into the game. Reframe to the Winner's Triangle.

Teaching method and workshop: Interactive, fun, experiential learning session based on validated, evidence based transformational coaching workshop. Successful poster presentations at national conferences in 2025 delivered by experienced coach Tailored to enagage all VARK learning styles Schedule: Introductions and Icebreaker Definition Relevance and Impact Interactive word cloud sharing experiences and themes Draw personal Drama Triangle Role play Reframing to Winner's Triangle using coaching tools: transactional analysis, visualisation, circle of influence, power poses, boundary setting, negotiation skills, cultivate presence, self compassion.

Expected outcomes: Awareness of the drama triangle can reduce: co-dependency, carbon footprint, over investigating, wasting resources and enhance access. Improvement in wellbeing and retention in General Practice reducing health inequity and improving sustainability. Invites cognitive empathy, seeing the situation through the lens of the patient and carers perspective enhancing patient care and defusing challenging situations Delegates empowered to break free from destructive patterns, fostering healthier relationships and develop an inclusive collaborative culture.

Conclusion: Delegates will learn how to reframe the Drama Triangle into the Winner's Triangle using personal, practical and realistic strategies that can be implemented immediately to empower and enhance their practice and drama proof their life in the consulation and beyond.

ID 1645 - Making Sense of COPD

Ioanna TSILIGIANNI [(1)] , Jaime CORRERIA DE SOUSA [(2)], Pedro FONTE [(3)], Amanda BARNARD [(4)]

(1) International Primary Care Respiratory Group And University Of Crete, Heraklion, Grèce,
(2) International Primary Care Respiratory Group And University Of Minho, Porto, Porto, Portugal,
(3) International Primary Care Respiratory Group And School Of Medicine, University Of Minho, Braga, Portugal,
(4) International Primary Care Respiratory Group And Australia National University, Canberrs, Australie

Context: COPD is underdiagnosed and mistreated in primary care due to challenges of objective diagnostic testing; confusion about the relative value of different interventions to the patient and the healthcare system and the accessibility of evidence-based interventions. This workshop will use three innovative primary care teaching tools, grounded in the latest scientific evidence and piloted in six countries, to help you make sense of COPD right care as suggested by the author and to offer personalised self-management support to the patient.

Objectives: At the end of the workshop participants will be able to ; 1. Use a structured approach to personalise COPD self-management support, based on Leventhal's common-sense model 2. Integrate an assessment of and response to the patient's emotional health in the consultation 3. Identify/list the main management tasks involved in caring for a patient with COPD, including pharmacological and non-pharmacological interventions.

Teaching method and workshop: After a brief introductory presentation on the most recent COPD management guidelines, participants will be involved in an ice-breaker activity in which they will be challenged to discuss less consensual aspects of the disease. This will be followed by a role-play session where our COPD Wheel and emotions cards will be used to demonstrate how to engage patients in planning and delivering the right care for them personally, with particular attention to the emotional state. Contextual differences will be explored, depending on the patient's 'breathing literacy' and the availability of interventions in primary care. We will offer French-speaking tables for small group work and make available the teaching materials in French.

Expected outcomes: By the end of the session, participants are expected to be familiar with the COPD Right Care tools and to be able to use them to improve the care provided to people living with COPD.

Conclusion: This workshop is designed to help clinicians improve their knowledge about COPD and thereby support them in providing better care for patients living with COPD.

ID 1648 - Deep End Networks: Surviving and Thriving together to provide primary care in deprived areas

Emily CLARK [(1)], Jessica RANDALL-CARRICK [(2)]

(1) Norwich Medical School, Norwich, Royaume-Uni,
(2) Nhs England, London, Royaume-Uni

Context: The Deep End movement is a network of people working in primary care serious about improving the health and well-being of those communities living in the most deprived areas across the UK and world. There are 12 Deep End movements from 8 countries on 4 continents. Together we collaborate, support and advocate on behalf of our population, staff and communities.

Objectives: To create an interactive, international learning space where Deep End practitioners share and compare innovations across health systems, using the A-CREW framework.

Teaching method and workshop: Introduction: Deep End origin, history and principles. We will briefly define "A-CREW" are the workstreams of the Deep-End movement in the UK and stands for Advocacy, Climate/ Sustainability, Research, Education and Workforce / Wellbeing. 10mins Participants will take part in a case exchange carousel, rotating through facilitated small-group discussions focused on real examples of progress and innovation from different Deep End networks. This face paced structured approach enables comparison of strategies across health systems and contexts, and allows for connections to be made between participants.35 mins. A visual harvesting technique will be used throughout the session by facilitators, with key insights and emerging themes captured live on shared templates to create a collective, co-produced output. The workshop will conclude with a plenary synthesis and reflective discussion linking learning back to practice, education, and advocacy. 15mins.

Expected outcomes: GPs and other healthcare professionals at every stage of their career are invited to attend, especially those who are interested in health equity. Participants will: 1. Gain insight into how Deep End principles are being applied internationally 2. Identify practical strategies to strengthen primary care in deprived areas 3. Contribute to the ongoing international dialogue on defining and delivering "good" Deep End general practice 4. Build connections with an international network committed to equity-focused primary care.

Conclusion: This workshop will take the liberty of inspiring and motivating the primary care fraternity to connect via the Deep end to advance equity globally.

ID 1712 - Continuity of Care saves lives, but is falling - how you can increase continuity in your primary care setting

Mark RICKENBACH [(1)], Luke SAYER [(2)], Ioannis SAXIONIS [(3)], Serge ENGAMBA [(4)]

(1) Frcp Frcgp Phd Fhea, Eastleigh, Royaume-Uni,
(2) Frcgp, Weybourne, Royaume-Uni,
(3) Mrcgp, Southampton, Royaume-Uni,
(4) Exeter University, Exeter, Royaume-Uni

Context: Continuity of care saves lives. The evidence base for continuity of care and how it reduces morbidity and mortality is increasing and consistent (Pereira Gray 2018) . A dose response relationship has now been demonstrated (Sandvik 2022) and for every two extra consultations with the same GP a 6% reduction in emergency admission has been reported (Barker 2017).

Objectives: The aim of this session is to get participants to consider themselves, as patients, trying to improve their own healthcare by increasing continuity of relational care with their GP. Then to consider how they could help do this as healthcare professionals for their own patients. The objectives include a reminder of the impact of continuity of relational care. Along with guidance on how to increase both their own continuity of care and that of their patients.

Teaching method and workshop: Paired discussion Panel discussion with audience questions Short presentations The session will define relational and other types of continuity, and give the evidence on the benefits. In pairs, participants will discuss what they would do to increase continuity for themselves as patients, which leads into the tips on how they might approach their own GP to achieve continuity. This will raise awareness of the barriers and ways to overcome these. In pairs participants will then be asked to consider their own practice in the context of continuity. The variation in practical approaches and toolkits for developing their own practice will be reviewed. Pairs will be then be asked to consider the next small step they might take for their own patients.

Expected outcomes: Increase knowledge about how continuity of care can increase the participants

own health and life expectancy Raise awareness of how healthcare professionals, as patients, can ensure continuity of their own care Understanding about what can be done to increase continuity of relational care for patients under the participant's care.

Conclusion: Continuity can be improved, saving lives, and improving both doctor and patient satisfaction. This can be done both for ourselves as patients and for our patients under our care. The impact can be high and make as much difference as medications with minimal disadvantages.

Corresponding author: Mark Rickenbach, mark@thedocrick.co.uk

ID 1787 - Building equitable and trustworthy primary care data platforms: governance and interoperability lessons from France

David DARMON [(1)] , Olivier SAINT LARY [(2)], Marc CHANELIÈRE [(3)], Matthieu SCHUERS [(4)]

(1) Université Côte D'azur, Nice, France,
(2) Université Versailles Saint Quentin, Paris, France,
(3) Université Lyon 1, Lyon, France,
(4) Université Rouen Normandie, Rouen, France

Context: Across Europe, fragmented primary care data limit the ability of health systems to promote equity, support population health surveillance, and sustain continuous quality improvement. While hospital-based data infrastructures are well developed, community-based primary care faces specific organisational, legal, and professional challenges. France has recently launched its first national, publicly governed primary care data platform (P4DP), grounded in professional autonomy, patient partnership, and responsible digital health. This experience provides transferable lessons for European countries seeking to develop trustworthy, interoperable, and human-centred primary care data platforms.

Objectives: By the end of this workshop, participants will be able to: Describe inclusive governance models that integrate clinicians, patients, researchers, and public institutions in primary care data platforms. Analyse common legal, technical, and cultural barriers to primary care data integration and identify pragmatic mitigation strategies. Use interoperability principles to support cross-border primary care research and learning health systems.

Teaching method and workshop: The workshop is designed as a highly interactive learning session combining short expert inputs with participatory methods. Teaching approaches include a structured case study, facilitated small-group discussions, and plenary synthesis to promote peer learning and collective reflection across different European contexts. Case study presentation (20 minutes): Introduction to the French P4DP initiative, focusing on governance choices, regulatory pathways, interoperability strategy, and ethical considerations specific to primary care. Facilitated small-group discussions (20 minutes): Participants will explore challenges and solutions related to equity, professional engagement, patient involvement, and digital responsibility within their own national systems. Plenary synthesis (20 minutes): Groups will share key insights, leading to the identification of transferable principles, success factors, and opportunities for European collaboration in primary care data infrastructures.

Expected outcomes: Participants will gain: A clear understanding of how primary care data platforms can strengthen equity, trust, and professional engagement. Practical governance and interoperability approaches adaptable across diverse European health systems. Concrete ideas for international collaboration and comparative primary care research using routine data.

Conclusion: This workshop will support family physicians, researchers, policy-makers, and patient partners in developing shared, human-centred, and trustworthy approaches to primary care data infrastructures, contributing to stronger learning health systems across Europe.

Corresponding author: David Darmon, david.darmon@univ-cotedazur.fr

ID 1825 - Empowering family doctors in primary care: A skills-building workshop for brief intervention on alcohol use

András TEREBESSY [(1)] , Jose-Miguel BUENO-ORTIZ [(2)], Francisco CAMARELLES-GUILLEM [(3)]

(1) Semmelweis University, Department Of Preventive Medicine And Public Health, Budapest, Hongrie,
(2) Spanish Society Of Family And Community Medicine, Madrid, Espagne,
(3) Centro De Salud Infanta Mercedes. Servicio Madrileño De Salud, Madrid, Espagne

Context: Hazardous and harmful alcohol consumption is a leading contributor to preventable morbidity and mortality in Europe. Primary care is an ideal setting for early identification and brief intervention (BI) however, implementation remains inconsistent due to time constraints and lack of

specific training. Supported by the WHO's training frameworks and the European Health Alliance on Alcohol (EHAA), this workshop—led by members of the WONCA XXX section—aims to bridge the gap between global recommendations and local practice (e.g., XXX models, university training), providing a unified approach to alcohol harm reduction.

Objectives: Understand the principles and appraise the latest evidence and WHO/EHAA guidelines of BI. Master practical screening techniques and motivational interviewing. Formulate pragmatic strategies to overcome implementation barriers in diverse primary care settings and identify pros and cons of BI.

Teaching method and workshop: This 60-minute interactive session employs a multi-modal pedagogical approach based on the WHO Alcohol Brief Intervention Training Manual: Interactive Mini-Lectures Skill-Drills: Focused case-based role-play scenarios Collaborative Problem-Solving: Small group work to map local adaptations Workshop schedule (60 minutes) 00-05: Introduction: Global/European epidemiology and the role of the GP 05-10: The Evidence Base: Review of guidelines and studies on BI effectiveness 10-40: Skills Lab: Role-play and feedback on screening and basic motivational interviewing techniques 40-45: The Reality Check: Moderated discussion on 'Pros & Cons' 45-55: Implementation Roadmap: Group work on integrating interventions into routine care 55-60: Conclusion: Synthesis of reflections and takeaway resources

Expected outcomes: Participants will gain measurable confidence in identifying hazardous drinking and delivering structured interventions. By translating the WHO manual into actionable clinical steps, GPs will leave with a toolkit for immediate practice integration, strengthening the preventive capacity of their respective health systems.

Conclusion: This workshop equips family doctors with the essential "soft skills" and clinical frameworks to turn every consultation into a potential preventive opportunity, aligning primary care practice with European public health priorities.

ID 1827 - One Health in Daily Practice: A Game-Based Workshop on Sustainable Clinical Decisions

Bruno VERSTRAETE [(1)] , Nathan GOMRÉE [(2)], Nathalie TILMANS [(3)]

(1) Uclouvain, Humain, Belgique,
(2) Saint Luc Bouge, Namur, Belgique,
(3) Uclouvain, Ottignies, Belgique

Context: Healthcare systems contribute substantially to climate change and environmental degradation. Beyond greenhouse gas emissions, pharmaceuticals are a major source of ecotoxic pollution, particularly in aquatic ecosystems, as many active pharmaceutical ingredients persist in the environment, bioaccumulate, or disrupt ecosystems, with long-term consequences for human and planetary health. In primary care, prescribing decisions strongly influence both the carbon footprint of healthcare and the environmental release of pharmaceutical residues. However, ecotoxicity remains largely absent from medical education and clinical guidelines, leaving general practitioners insufficiently equipped to integrate these considerations into routine clinical practice. Innovative educational approaches are therefore needed to translate complex environmental information into clinically relevant and actionable knowledge. We developed a serious game targeting postgraduate physicians and tested it under real-life conditions with early-career general practitioners.

Objectives: After participating in this serious game, participants will be able to: Identify how common prescribing decisions in primary care contribute to carbon emissions and pharmaceutical ecotoxicity. Integrate eco-responsible prescribing principles while maintaining evidence-based practice and patient safety. Critically reflect on their own prescribing habits and identify opportunities for improvement in daily practice.

Teaching method and workshop: this serious game fits up to 40 participants divided into groups of 4 participants (1 group-1 game) Role-play using predefined physician profiles with distinct prescribing behaviors Case-based clinical decision-making using seven clinical scenarios, each available in three levels of increasing complexity; participants may progress through the scenarios according to available time and group dynamics Immediate feedback on clinical impact, carbon footprint, ecotoxicity, and economic cost Workshop schedule : Introduction (5 minutes) Game session (45 minutes) Debriefing and discussion (10 minutes).

Expected outcomes: By the end of the workshop, participants will: Increase awareness of the environmental consequences of prescribing beyond climate impact alone. Develop practical strategies to deprescribe and promote safer alternatives. Better understand how ecotoxicity complements carbon footprint in sustainable healthcare. Experience a transferable educational model applicable to postgraduate medical training.

Conclusion: This workshop demonstrates how a serious game can translate complex environmental concepts into practical clinical learning. By embedding carbon footprint and ecotoxicity into realistic primary care scenarios, general practitioners are empowered to practice medicine that protects both patients and the planet.

Corresponding author: Bruno Verstraete, bruno.verstraete@uclouvain.be

ID 1836 - Collaborative multidisciplinary primary care teams: sharing experiences across Europe

David HALATA [(1)] , Rosario FALANGA [(2)], Pawel ZUK [(3)], Amanda KEEFE [(4)], Katerina JAVORSKA [(5)], Joyce KENKRE [(6)]

(1) European Rural And Isolated Practitioners Association (euripa), Prague, Tchéquie,
(2) Department Of Primary Care, Local Health Authority, Pordenone, Italie,
(3) Medical And Diagnostic Centre, Siedlce, Pologne,
(4) Azienda Sanitaria Friuli Occidentale, Pordenone, Italie,
(5) Department Of Preventive Medicine, Charles University, Hradec Kralove, Tchéquie,
(6) University Of South Wales, Cardiff, Royaume-Uni

Context: Multidisciplinary teams (MDTs) are increasingly essential to delivering accessible and high-quality primary care, particularly in rural and underserved areas facing workforce shortages, fragmentation of services and rising multimorbidity. Across Europe, MDTs have developed through diverse organisational and funding models. However, without structured planning and alignment with population needs, MDTs may inadvertently reinforce inequalities or reduce continuity of care. There is a need for shared learning on how MDTs are organised, how roles are allocated, and which approaches support effective, equitable and sustainable team-based care. A key element of these innovations is the shift of tasks from physicians to non-medical healthcare.

Objectives: By the end of the workshop, participants should be able to: - Describe the role of MDTs in primary care, especially in rural and underserved regions. - Identify structural and workforce challenges influencing MDT development. - Evaluate different MDT models across Europe. - Assess their impact on access, quality and efficiency - Discuss adapting MDTs to population needs for effective skill-mix. - Recognise common barriers and enabling factors influencing effective team implementation.

Teaching method and workshop: Presenters will introduce evidence-based MDT concepts, focusing on task substitution vs supplementation, collaboration vs coordination, and population-need assessment. Most of the workshop will involve participants from different European regions sharing experiences of MDTs in primary care. A final plenary discussion will synthesise insights and extract transferable principles for practice. Workshop schedule 20 min: Introduction, conceptual framework, European MDT examples, interactive polling. 30 min: Small-group work on case vignettes: role mapping, skill-mix redesign and barrier analysis. 10 min: Plenary synthesis and formulation of practical take-home principles.

Expected outcomes: Participants will be able to articulate core principles for MDT design, ccompare organisational models and identify factors influencing implementation, especially in rural and underserved areas. They will gain practical tools to align MDT composition with local population needs and support workforce planning, service development and integrated care delivery.

Conclusion: MDTs are central to building resilient, equitable primary care systems. This workshop will share diverse European experiences and equip participants with evidence-informed, transferable strategies for developing effective, patient-centred and sustainable multidisciplinary teams.

ID 1837 - Balint groups in family medicine: a space for liberty, equity, and human connection

Philippe GUILLOU [(1)] , Isabelle MARTINOT-NOUET [(2)], Jacob BENAROSCH [(3)], Marie-Frédérique BACQUÉ [(1)]

(1) Strasbourg University, Strasbourg, France,
(2) Société Médicale Balint, Mûrs-Érigné, France,
(3) Société Médicale Balint, Paris, France

Context: In a primary care setting where freedom, fairness, and humanism are central, the Balint group offers a unique space to explore the relational

dynamics between caregivers and patients. By promoting active listening, collective reflection, and the sharing of experiences, this workshop enables participants to challenge biases, inequalities in access to care, and the ethical implications of daily practice. Through its interactive and multidisciplinary approach, it strengthens professional solidarity and encourages a more empathetic and patient-centred approach to medicine, in line with the fundamental values of primary care.

Objectives: Improve the caregiver-patient relationship Become aware of personal emotions and reactions Develop a better understanding of patient needs Work on difficult or complex cases Strengthen reflection on professional practice Prevent burnout Improve the quality of care Develop communication skills Promote teamwork and collaboration.

Teaching method and workshop: ►Objective: Explore caregiver-patient dynamics through emotions, representations, and interactions—understanding, not solving. ►Premises: Caregivers are therapeutic tools. Conflicts often reveal unconscious/systemic patterns. Group intelligence unlocks impossible-alone insights. ►Balint Session Format : • Framework: Confidentiality, kindness, relationship focus. Fishbowl setup: small core group with observers in a larger outer circle. • Fishbowl: Central discussion, fluid participation with observers at the end of the session. • Case: Volunteer shares a meaningful professional situation. • Exploration: Questions → Associations/hypotheses → Mirroring. • Close: Facilitator summarizes insights, shares guidelines, and ends the session. ►5 min, Presentation of the framework, Clarification of the rules ►45 min, Balint group work, 1 case presented, with time for presentation (10 minutes), questions, and collective analysis (35 minutes). ►10 min, Collective summary, Recap learning points, suggest courses of action, and close.

Expected outcomes: Clarity on a complex professional situation Collective awareness Emotional support and reduced isolation Improved communication skills Strengthened critical thinking Positive group dynamics Identification of training or support needs Mirror effect and vicarious learning.

Conclusion: In an era where medicine risks losing its humanity, this Balint workshop offers a vital pause—a space to listen, reflect, and reconnect. By exploring the emotional heart of care, it restores equity, empathy, and humanism to family medicine, one shared story at a time.

(8) Semfyc.egprn.wwpqs, Barcelona, Espagne,
(9) Semfyc. Wwpqs. Wonca Sig On Non-Communicable Diseases, Cartagena-Murcia, Espagne,
(10) Equip, Bremen, Allemagne

Context: Deprescribing (D) is a critical patient safety intervention, particularly for elderly patients where polypharmacy (>10 drugs) significantly increases the risk of adverse events. Beyond individual safety, D aligns with One Health and Planetary Health principles. Reducing unnecessary medication use directly mitigates pharmaceutical pollution in water systems and lowers the carbon footprint associated with global drug manufacturing and distribution. This joint workshop—led by experts from EQUIP, EGPRN, WONCA WP on Quality and Safety, on Research and on Planetary Health and WONCA SIG on non-communicable diseases—applies validated frameworks (e.g., Beers/STOPP-START criteria) to shift the clinical paradigm toward optimizing therapy for both patient and planet.

Objectives: Identify and manage "therapeutic cascades" to improve clinical safety and environmental sustainability. Evaluate evidence to safely stop harmful medications, reducing the pharmaceutical load on the environment. Master communication strategies to empower patients in shared decision-making regarding "Green Deprescribing." Develop a transferable plan for immediate implementation in participants' home practices.

Teaching method and workshop: We employ an active-engagement pedagogy. Following an evidence-based briefing on clinical and planetary benefits, participants engage in facilitator-led small-

group work: 00-10m: Introduction: Clinical safety and Planetary Health context. 10-15m: High-fidelity clinical case presentation. 15-40m: Interactive breakout groups: Solving dilemmas using D-resources. 40-50m: Plenary sharing: Synthesizing group proposals. 50-60m: Take-home messages and resource distribution.

Expected outcomes: Participants will gain actionable insights and a Deprescribing Toolkit. Outcomes are highly transferable: attendees will leave with the skills to lead medication reviews that improve patient quality of life while contributing to healthcare sustainability.

Conclusion: The GP's role in deprescribing is paramount. This workshop provides the tools to bridge the gap between theoretical safety and daily practice, ensuring a wiser, safer, and more sustainable future for primary care. Keywords: Deprescriptions, Patient Safety, Polypharmacy, One Health, Environmental Health.

ID 1908 - How Should We Identify and Manage Elderly Patients with Nutritional Disorders?

Didem KAFADAR [(1)] , Burcu KAYHAN TETIK [(2)], Ayşen FENERCIOĞLU [(1)], Nurver SIPAHIOĞLU [(1)]

(1) Istanbul University-Cerrahpasa, Istanbul, Türkiye, (2) Inonu University, Malatya, Türkiye

Context: In ageing individuals, changes in bodily functions and the body's transformation process begin. With ageing, a physiological decrease in food intake occurs. The decreased sense of taste and smell associated with ageing, along with changes in appetite, prolonged gastric emptying, and hormonal changes, lead to physiological anorexia and associated weight loss, which predispose older individuals to malnutrition. In addition to all this, the presence and severity of comorbidities also increase morbidity and mortality. Nutrition plays an important role in the health status of older individuals. Therefore, a comprehensive assessment of nutritional status in older adults is crucial and includes clinical examination involving comprehensive history and physical examination, psychosocial assessment, anthropometric measurements, biochemical indicators, diagnostic tests, and food consumption.

Objectives: In this workshop, we aim to discuss how to define nutritional status of elderly, how to manage elderly with malnutrition in everyday practice, assessments of daily diets of the patients, and biochemical markers which are effective in detailed assessment and follow-up of patients who are at risk of malnutrition.

Teaching method and workshop: In the first part, we will define the screening tools which can be used in routine practice. In the second part, through case discussions, utilization of screening tools and anthropometric methods, which can be used for nutritional evaluations will be covered. In the third part, dietary assessment methods, and biochemical indicators will be discussed through sample cases. In the fourth part, experiences on managing elderly patients with unfavourable nutritional status will be shared and discussed.

Expected outcomes: To learn about various nutritional screening tools to be able to assess nutritional status. To learn about practical anthropometric measurements and formulas to define nutritional status. To be able to assess diet using different methods. To be able to interprete initial biochemical markers are effective in the assessment and monitoring of acute and chronic malnutrition. To manage the timely referral of the patient.

Conclusion: In summary, initial assessments on identifiable factors affecting nutritional status can be conducted in primary care to initiate treatment and necessary referrals. Multidisciplinary primary care health professional teams can identify symptoms affecting nutrition that can be reversed and implement interventions in line with common goals.

ID 1921 - Job Satisfaction and Joy at Work supporting Quality Care in General Practice

Andrée ROCHFORT [(1)], Maria Pilar ASTIER [(2)], José Miguel BUENO ORTIZ [(3)] , Uros AZMAN [(4)], Erika ZELKO [(5)], Nezih DAGDEVIREN [(6)], Naldy PARODI-LOPEZ [(7)], Joel LEHMAN [(8)], Maria MATUSOVA [(9)]

(1) Irish College Of Gps, Dublin, Irlande,
(2) Semfyc, Madrid, Espagne,
(3) Semfyc, Murcia, Espagne,
(4) Slovenia, Maribor, Slovénie,
(5) Jku, Linz, Autriche,
(6) Tuhud, Edirne, Türkiye,
(7) Swedish College, Gothenburg, Suède,
(8) Equam, Zurich, Suisse,
(9) Slovakian College, Bratislava, Slovaquie

Context: Job satisfaction and enjoyment of work by the medical workforce is a critical factor in delivering quality of care in primary care. It influences engagement with work, productivity and quality of communication. It is also a factor that influences the retention of the medical workforce. When it is diminished or absent it impacts on patient safety culture. The perspectives of the primary care workforce need to be collected and communicated through representative organisations to multiple stakeholders in the health sector.

Objectives: Learning Objectives will be achieved by group work in two consecutive sessions: Q1. What factors contribute to JOY AND SATISFACTION, and what contributes to the CHALLENGES faced by doctors in experiencing job satisfaction and joy in medical practice? Q2. What solutions do you propose for improving job satisfaction and joy for people who work in primary care?

Teaching method and workshop: 5 MINUTES - context setting presentation 10 minutes brainstorming in small groups Q1 10 minutes reports from small groups on Q1 10 minutes brainstorming in small groups Q2 10 minutes reports from small groups on Q2 10 minutes open floor discussion and conclusion close.

Expected outcomes: Explore the factors that promote job satisfaction and retention of the medical workforce in family medicine. Use this information to advocate for improving the work conditions of the medical workforce in family medicine. Gather views on how we communicate this information to health sector stakeholders (employers, health service managers, policy makers, regulators, the government, the public).

Conclusion: The pursuit of quality of care requires health sector employers and stakeholders to support the retention of the medical workforce employees and contractors. Job satisfaction and enjoyment of work are key factors that impact on retention of healthcare workers, and on patient safety culture and on the experience of care quality by both patients and the primary care team. Advocacy is necessary for physician wellbeing and optimum patient experience.

ID 1945 - Soon we will all be patients: What is new in overdiagnosis?

Tom AXELROD [(1)], Serdar OZTORA [(2)], Amnon LAHAD [(3)]

(1) Clalit Healthcare Services And The Hebrew University, Jerusalem, Israël,
(2) Trakya University Medical School Department Of Family Medicine, Trakya, Türkiye,
(3) Amnonl@ekmd.huji.ac.il, Jerusalem, Israël

Context: Overdiagnosis means making people unnecessarily into patients. Overdiagnosis is a global problem and is happening when diagnosing mental conditions as well as somatic conditions. To an individual, being overdiagnosed often triggers a cascade of psychosocial harm and overtreatment. In a societal context, overdiagnosis is extremely costly and harmful to public health. To general practitioners, overdiagnosis means more work, increased social inequity, and to some extent work that increases the inverse care law.

Objectives: By the end of this workshop, participants will be able to: 1. Define overdiagnosis and recognize its manifestations in primary care. 2. Describe the individual, societal, and professional harms associated with overdiagnosis and overtreatment. 3. Critically appraise recent evidence and international guidelines for selected topics. 4. Reflect on their own clinical experiences and identify strategies to reduce unnecessary diagnoses and medicalisation in general practice.

Teaching method and workshop: The symposium will begin with 5 short presentations (5 mins each – total 25 mins): • What is overdiagnosis • Harms of overdiagnosis • Low-dose CT for smokes: what is the overdiagnosis cost? • Mammography – 40 or 50? new USPSTF guideline • The emotional cost of screening tests - anxiety about results • HRT - what is the right balance? (optional) followed up by discussions in small groups (guided by a question on each of the above topics) (20 min) ending with a plenum discussion (15 mins).

Expected outcomes: Participants are expected to gain a clearer understanding of the drivers and consequences of overdiagnosis, increased confidence in discussing uncertainty and harms with patients, and practical ideas for resisting “too much medicine” in everyday clinical practice. The workshop will provide participants with an opportunity to engage in international dialogue on overdiagnosis, exchange ideas and perspectives with colleagues from different countries, and gain deeper insight into selected key issues in the field.

Conclusion: Drawing on Jønsson and Brodersen's award-winning book Soon we will all be patients (2022) and highlights from recent EUROPREV conferences, this symposium addresses overdiagnosis as a central challenge for contemporary general practice. By combining evidence, theory, and clinicians' experiences, the workshop aims to support GPs in counteracting unnecessary diagnoses, overtreatment, and the overmedicalisation of life.

ID 1948 - Development of new primary care focussed guidelines: a successful ESPCG process

Juan MENDIVE [(1)], Christos LIONIS [(2)], Foteini ANASTASIOU [(2)], Mihaela UDRESCU [(3)], Jelena RAKIC-MATIC [(4)]

(1) Espcg, Barcelona, Espagne,
(2) University Of Crete, Heraklion, Grèce,
(3) Espcg/asnmf, Bucharest, Roumanie,
(4) Health Centre Zagreb West, Zagreb, Croatie

Context: ESPCG is being participating during the last years in the development of primary care-focused guidelines on different gastrointestinal problems (including liver and pancreas guidelines).

Objectives: Main learning objective from this session is to update participants on some of the most relevant primary focused guidelines in which ESPCG is being recently involved.

Teaching method and workshop: Juan Mendive (Spain). Chair of the session. -MASLD consensus guideline for primary care: an international ESPCG lead experience. Christos Lionis and Foteini Anastasiou (Greece) -DBGI guideline for primary care: a new approach of the functional GI disorders. Juan Mendive (Spain) -Pancreatic lesions from non-GI specialists: a new vision primary care guideline. Mihaela Udrescu (Romania) -Nausea and Vomiting: A primary care perspective from the European Guideline. Jelena Rakic-Matic (Croatia) Guidelines will be presented on easy -to-learn materials, including algorithms for primary care management as well as frequently presented clinical scenarios in primary care . After the presentation of these different guidelines, a proposed interactive debate with participants will be promoted.

Expected outcomes: As a main outcome of the session, it is expected that participants will gain updated knowledge of very frequent primary care managed conditions.

Conclusion: ESPCG is providing an adequate platform to update European GPs with a primary care state-of-the art knowledge for the benefit of our patients.

Corresponding author: Juan Mendive, juanmmendive@gmail.com

ID 1982 - From Prompt to Practice: Hands-on Use of Artificial Intelligence in Daily Family Medicine

Adi SEGAL [(1)], Dorin TAL [(1)] , Inbal POLINER [(2)]

(1) Meuhedet Health Fund, Northern Israel, Haifa, Israël,
(2) 2nd year resident in a Family physician residency program in Israel., Hadera, Israël

Context: Artificial intelligence (AI) tools are becoming increasingly accessible to clinicians, offering significant potential to support family medicine in areas such as clinical reasoning, documentation, patient communication and medical education. Despite this availability, structured training for the practical application of AI in primary care remains limited. Many family physicians and residents lack confidence in translating AI's capabilities into safe and meaningful everyday practice. This workshop addresses this gap by focusing on experiential, scenario-based learning grounded in best practices for digital health and lifelong learning.

Objectives: By the end of the workshop, participants will be able to: Identify common clinical and educational scenarios in family medicine where AI tools may be appropriately used. Use AI tools to generate practical outputs for daily primary care work and to optimize study processes (e.g. summarizing guidelines, literature review). Formulate effective prompts and critically evaluate AI-generated results. Recognize limitations, ethical considerations, data protection and patient safety issues related to AI use in family practice.

Teaching method and workshop: The workshop will be conducted in an interactive, small-group format. Participants will be divided into teams and presented with real-life scenarios commonly encountered in family medicine and residency training. Each group will work hands-on with AI tools to produce a defined practical output, such as a patient-facing explanation, learning aid for complex medical topics and more. Workshop Schedule The session will begin with a brief plenary introduction. This will be followed by facilitated small-group work on selected scenarios (clinical and educational) with hands-on use of AI tools. The session will conclude with a plenary discussion in which groups will share

outputs, discuss challenges, and identify transferable tools for both practice and learning.

Expected outcomes: Participants will gain practical experience and increased confidence in using AI tools. They will leave with ready-to-use prompts, workflows, and examples that can be immediately applied in their clinical settings and utilized to streamline their professional development and learning routines.

Conclusion: This workshop provides family physicians and residents with a structured, hands-on approach to integrating AI tools into everyday practice. It supports efficiency and innovation while maintaining patient-centered, safe care, and enhances the capacity for continuous medical education.

ID 1983 - Liberty, equity and fraternity after the history of family medicine

Josep VILASECA [(1)] , José Miguel BUENO [(2)], Alexandra STANESCU [(3)], Eva MARTINEZ [(1)]

(1) Althaia Foundation, Manresa, Espagne,
(2) Servicio Murciano De Salud, Alcantarilla, Espagne,
(3) Universitatea De Medicină Și Farmacie "carol Davila", Bucharest, Roumanie

Context: The development of family medicine in the 21st century towards the goals of liberty, equity and fraternity can use the lessons learned after the previous work of outstanding physicians of the past. If we do not know where we come from and what are the challenges faced by our predecessors, we are at risk of committing again the same mistakes rather than using their expertise.

Objectives: To illustrate with some examples the achievement of liberty, equity and fraternity after the lives of outstanding physicians, as follows: - Julian Tudor Hart: the inverse care law; research in primary care; working with the deprived populations (fraternity) - Barbara Starfield: the features of primary health care (equity) - David Sackett: evidence based medicine (equity) - Archibald Cochrane: effectiveness and efficiency (equity, fraternity). War volunteer (liberty) - Albert Schweitzer: international cooperation (liberty, equity, fraternity) To identify the challenges in the present time related to liberty, equity and fraternity, in Europe and abroad. To suggest strategies to combat the obstacles to reach liberty, equity, and fraternity.

Teaching method and workshop: Brief lecture summarising the main achievements of outstanding physicians of the 20th century and introduction of the exercise: 15 minutes Exercise: identifying the current challenges related to liberty, equity and fraternity in our context, and drawing an action plan to overcome them. 20 minutes Group discussions: 20 minutes Conclusions by the presenters: 5 minutes.

Expected outcomes: To develop skills to identify the challenges on liberty, equity and fraternity in a geographical context and in the present or near future. To suggest some tools to leverage the actions in favour of liberty, equity and fraternity To draw an action plan to achieve liberty, equity and fraternity in Europe by the year 2030.

Conclusion: The existing challenges on liberty, equity and fraternity in Europe should be identified. A helpful tool for counteracting them are the lessons learned from the outstanding physicians of the past. Reflection and action are needed. A new vision of history can enlighten the future.

ID 2027 - More Than a Headache: An Escape Room Challenge Providing Practical Migraine Update for GPs

Yusra HASHMI [(1)] , Khunsha FATIMA [(2)], Akram HUSSAIN [(3)]

(1) Royal College Of General Practitioners, Warwick, Royaume-Uni,
(2) University Of Warwick, Coventry, Royaume-Uni,
(3) College Of Family Physicians Of Canada, Windsor, Canada

Context: Migraine and chronic headache disorders are among the most common and disabling conditions seen in primary care, yet they remain under-recognised, under-treated, and over-referred. My interest in this area stems from my own lived experience of debilitating, treatment-resistant chronic migraines, which affected my personal and professional life. Through this journey, I gained deeper insight into the complexity of headache disorders and the gaps in care that many patients face. During final year of my General Practice Training, I started doing dedicated migraine and chronic headache clinics in my own time free of cost, where I learned that headaches are rarely “just headaches” and often reflect a broader biopsychosocial context. Recent advances, including CGRP-targeted therapies, have significantly changed

migraine management and offer new opportunities for effective primary care treatment.

Objectives: Enhance participants' confidence and competence in managing migraine and chronic headache disorders in primary care. We will explore the complexity of headache presentations, apply sustainable patient-centred management strategies, reduce unnecessary specialist referrals and understand the role of newer treatments, including CGRP-based therapies, such as Monoclonal Antibodies (mAbs) and Small-Molecule Antagonists (Gepants).

Teaching method and workshop: An interactive approach to make learning engaging and memorable with brief teaching segments interspersed with case-based discussions reflecting anonymised real primary care scenarios, allowing participants to apply knowledge immediately. Live audience interaction facilitated through polling tools and myth-busting quizzes, encouraging participation and reinforcing learning points. Practical decision-making exercises aligned with current guidelines would enable attendees to consolidate their management strategies. Participants will also be given resources, including headache diary template developed in the presenter's clinics, to support ongoing patient care and follow-up.

Expected outcomes: Participants will gain confidence in managing migraines and chronic headaches in primary care, improve clinical decision-making, and contribute to more sustainable care by reducing unnecessary referrals and specialist waiting times.

Conclusion: Improving headache management begins with confidence, clarity, and connection. We aim to reframe how headaches are understood and managed in primary care. By combining lived experience, clinical insight, and interactive learning, we want to empower primary care clinicians to deliver effective, compassionate, and sustainable headache care by recognising that behind every headache is a patient with a unique story.

ID 2035 - Equipping primary care teams to support bereaved patients

Daniel KNIGHTS [(1)] , Lynsey BENNETT [(2)], Felicity KNIGHTS [(3)], Aaron POPPLETON [(4)]

(1) University Of Cambridge, Cambridge, Royaume-Uni, (2) Summertown Health Centre, Oxford, Royaume-Uni, (3) City St George's, University Of London, London, Royaume-Uni,
(4) Keele University, Keele, Royaume-Uni

Context: Bereavement is a universal human experience with significant impacts on health and wellbeing, and GPs are often the first point of contact when someone is bereaved. These conversations require a different approach from the classic problem-solving model of general practice. Whilst most people do not require specialist bereavement support, primary care teams need robust processes and skills to identify bereavement support need, assess risk, support adjustment and signpost appropriately.

Objectives: Understand the impact of bereavement on health and wellbeing, forms of helpful support and the importance to primary care Explore ways that primary care teams can improve services and processes to better identify and proactively support grieving patients Discuss the utility and applicability of a clinical consultation model for bereavement to participants' own contexts Develop a nuanced understanding of assessing need and delivering more tailored signposting to bereaved patients.

Teaching method and workshop: Brief presentations, small group discussions, clinical case studies: Introduction (10 mins): Overview of bereavement, health, helpful support and the role of primary care Group Discussion 1 (15 mins): Small group sharing of structures for identifying and contacting bereaved patients in participants own settings; brief presentation of quality improvement initiatives to address and group discussion on feasibility of applying these. Group Discussion 2 (20 mins): Facilitators will present a consultation approach for bereavement in primary care. Groups will discuss its application to example clinical cases and their own context. Presentation (10 mins): Systematic literature review results on informal bereavement support interventions (including studies from at least 8 different European countries) with implications for more tailored signposting for patients presenting to primary care Self-care and questions (5 mins): Consideration of the impact of personal and professional grief on primary care professionals, sharing of resources and opportunity for questions.

Expected outcomes: Attendees will be equipped to better support bereaved patients in primary care across the spectrum of care, from proactive identification to sensitive consulting to tailored signposting.

Conclusion: This workshop will demonstrate that bereavement support is a core and important part of primary care and that with simple organisational structures and adaptations to consultation approaches, primary care clinicians are excellently placed to deliver this sensitively and effectively.

Corresponding author: Daniel Knights, dphk2@medschl.cam.ac.uk

ID 2074 - The Future of e-Health in Primary Care: Is There a Place for a Primary Care Classification System?

Bianca Luiza DE SÁ E SILVA [(1)] , Gustavo GUSSO [(2)], Oystein HETLEVIK [(3)], Elena CARDILLO [(4)], Oliver VAN HECKE [(1)], Diego SCHRANS [(1)], Jan DE MAESENEER [(1)], Joseph ROUMIER [(1)], Robert VANDER STICHELE [(1)]

(1) Ghent University, Ghent, Belgique,
(2) Universidade De São Paulo, São Paulo, Brésil,
(3) University Of Bergen, Bergen, Norvège,
(4) Institute Of Informatics And Telematics, National Research Council (iit-Cnr), Pisa, Italie

Context: Digital transformation in health care systems is now rapidly evolving. E-Health organisations are promoting the use of SNOMED CT or ICD-11 as a reference terminology. The position of domain-specific classifications such as the International Classification of Primary Care (ICPC) within this transformation remains unclear.

Objectives: To discuss the relevance of a classification for Primary Care and the current status of ICPC; To showcase research projects in Primary Care with regards to ICPC; To discuss the position of the profession with regard to reference terminologies; To bring awareness to the precarious position of classifications in primary care in the current transition happening in e-Health technologies and to learn about possible alternatives.

Teaching method and workshop: Three topics will be briefly introduced and then debated as an expert panel discussion, with time allotted for Q&A from the audience at the end. The discussion will be led by the following questions: 1) Is there a place for ICPC-3 next to SNOMED CT as reference terminology? a) What is the relevance of a classification for Primary Care? b) Why is a reference terminology necessary in the first place? 2) What are the lessons of the existing linguistic end-user terminologies or other types of knowledge organization systems such as thesauri used in Primary Care to access clinical data (examples from XXX and XXX). a) What have been the challenges and benefits of using such thesauri? b) The XXX and XXX experience: data collection, Episode of Care, XXX, XXX, etc. 3) How can GPs be supported for clinical coding at the point-of-care? Will AI solve everything, or do we need more? Workshop schedule: Introduction of panel and topic: 5min 1) Panel discussion + discussion: 15min 2) Testimonies + discussion: 15min 3) Presentation of 2 scenario's + discussion: 15min Q&A from the audience: 10min.

Expected outcomes: The audience is increasingly aware of the urgency of preserving the International Classification of Primary Care in the age of digital transformation.

Conclusion: Issues identified and implementation pathways at national and international level are a key topic for discussion and for formulation of recommendations for organizations responsible for primary care classification systems.

ID 2087 - Redesigning Access Pathways Through Digital Triage: Global Principles for Fair, Efficient and Risk-Managed Primary Care

Vincent SAI, Mina GUPTA, Nina JHITA, Tom RATCLIFFE, Sian KNIGHT

Modality Partnership, Nationwide, Royaume-Uni

Context: Across the world, primary care systems are under intense pressure. Demand continues to rise, the workforce is stretched, and traditional "first come, first served" access models create inequity, inefficiency and unmanaged clinical risk. Digital triage offers a structural solution: a way to organise demand safely, prioritise care by urgency, improve equity, and provide a clearer, more predictable experience for patients and clinicians. This workshop introduces universally transferable principles for designing safe, fair and sustainable triage systems—whether digital, hybrid or low-tech. Many countries face the same challenges: long queues, crowded telephone lines, inconsistent triage processes and rising patient frustration. Without structured triage, urgent problems can be missed while non-urgent cases consume capacity. Digital triage, when implemented with strong governance and inclusion pathways, can: - provide a single, consistent access route - reduce bottlenecks - improve clinical visibility - create equitable access for diverse populations - enable automation of low-risk requests The workshop focuses on principles applicable across high-, middle- and low-resource settings.

Objectives: Participants will be able to: 1. Understand the core components of a safe triage model. 2. Redesign access pathways around urgency and clinical need. 3. Apply governance and risk-mitigation frameworks. 4. Build inclusive pathways for patients with low digital confidence. 5. Engage staff and restructure workflows to support a triage-first model.

Teaching method and workshop: Teaching methods Short presentations on access redesign and global triage challenges. Mentimeter activity: participants identify their top access pain points. Small-group reflection on how triage principles could apply in their systems. Facilitator examples illustrating phased implementation and common pitfalls. Workshop schedule 0–10 min: Global access pressures 10–20 min: Principles of safe digital triage 20–35 min: Mentimeter + discussion 35–50 min: Governance, inclusion and workflow redesign 50–60 min: Takeaways & Q&A.

Expected outcomes: Participants gain a practical framework for implementing or improving triage models, with adaptable strategies for equity, safety and demand management.

Conclusion: This workshop positions digital triage as a structural enabler of fair access and sustainable primary care, offering delegates transferable tools to redesign access pathways in any health system.

ID 2108 - The Unteachable Moments: What Family Medicine Learns Outside the Curriculum

Goldin Isserlis MARINA, Tom AXELROD, Amalia WALZER

Clalit Health Care And Hebrew University, Jerusalem, Israël

Context: Family medicine is grounded in evidence-based practice, clinical guidelines, and structured competencies. However, many of the most formative moments in a family physician's professional life occur outside formal teaching: moments of uncertainty, moral discomfort, emotional resonance, or quiet realization. These "unteachable moments" profoundly shape clinical judgement, professional identity, and resilience, yet they are rarely acknowledged or explored within medical education.

Objectives: To identify and articulate unteachable moments in everyday family medicine practice. To explore how these moments influence clinical judgement and professional growth. To provide participants with reflective tools that can be applied in clinical work and teaching.

Teaching method and workshop: This highly interactive workshop is based on facilitated reflection and shared storytelling. Introduction (10 minutes): Framing the concept of unteachable moments and creating a safe learning environment. Individual Reflection (10 minutes): Participants recall a brief anonymized clinical moment that changed how they practice, without being linked to new knowledge or guidelines. Small Group Sharing (25 minutes): Participants share their moments in groups of 4–6, guided by structured reflection prompts. Plenary Discussion (20 minutes): Identification of common themes such as uncertainty, boundaries, vulnerability, and professional identity. Closing Reflection (10 minutes): Translating insights into clinical and educational practice. No prior preparation is required.

Expected outcomes: Participants will gain language for tacit clinical knowledge, increased awareness of experiential learning processes, and practical reflection tools to reduce professional isolation and enhance resilience.

Conclusion: By legitimizing what cannot be formally taught, this workshop highlights the unique epistemology of family medicine: a discipline shaped not only by evidence, but by lived experience, relationships, and human complexity.

Corresponding author: Goldin Isserlis Marina, alon18@windowslive.com

ID 2115 - Crossing the Line: When Personal Values Enter Clinical Decisions

Goldin Isserlis MARINA, Tom AXELROD, Amalia WALZER

Clalit Health Care Services And Hebrew University, Jerusalem, Israël

Context: Family physicians frequently face clinical decisions in which guidelines provide limited or conflicting direction. In these situations, values, emotions, and personal experience inevitably influence judgement. An unspoken question often arises: What would I do if this were my parent? This question reveals the ethical tension between professional responsibility, evidence-based practice, and personal morality, yet it is rarely addressed openly in medical education.

Objectives: To explore how personal values and emotional proximity influence clinical decision-making. To examine ethical tension in everyday family medicine beyond formal ethical frameworks. To strengthen reflective skills for managing value-laden clinical conversations.

Teaching method and workshop: This interactive, case-based workshop uses role-switching and facilitated group discussion. Introduction (10 minutes): Framing ethical tension in family medicine and establishing a respectful learning environment. Case Presentation (10 minutes): A complex clinical scenario involving uncertainty, risk, and competing values. First Discussion Round (20 minutes): Participants discuss the case from the perspective of the treating family physician, focusing on clinical reasoning and professional responsibility. Role Switch (20 minutes): Participants revisit the same case from the perspective of a family member, explicitly addressing emotions, fears, and values. Plenary Reflection (10 minutes): Comparing perspectives and identifying shifts in priorities, communication, and risk tolerance.

Expected outcomes: Participants will develop increased awareness of personal biases, improved ethical sensitivity, and greater confidence in navigating complex, value-driven clinical decisions.

Conclusion: By explicitly addressing the question clinicians often ask themselves silently, this workshop brings ethical ambiguity into the open and strengthens family medicine's core values of compassion, shared decision-making, and relational care.

Corresponding author: Goldin Isserlis Marina, alon18@windowslive.com

ID 2155 - Implementing Digital Lifestyle Coaching at Scale: Supporting Behaviour Change and Reducing Long-Term Condition Burden in Primary Care

Vipan BHARDWAJ [(1)] , Vincent SAI [(1)], Abhishek SHARMA [(2)], Mina GUPTA [(1)], Nina JHITA [(1)]

(1) Modality Partnership, Nationwide, Royaume-Uni, (2) Goqii Uk, Nationwide, Royaume-Uni

Context: Across the world, primary care systems face escalating pressure from lifestyle-related conditions such as diabetes, hypertension, obesity, stress and chronic pain. These conditions often require long-term behaviour change, yet traditional consultations offer limited time for sustained support. Digital lifestyle coaching provides personalised, coach-led behaviour change interventions at scale, enabling patients to make meaningful progress between clinical reviews. This workshop introduces practical, globally transferable strategies for integrating digital coaching programmes into primary care to improve outcomes and reduce avoidable demand. Lifestyle-related conditions are a major driver of appointments, hospitalisations and healthcare spending worldwide. Many patients struggle to adopt or maintain lifestyle changes without consistent follow-up, and primary care teams often lack the capacity to provide ongoing behaviour-change support. Digital coaching models combine personalised goal setting, behavioural nudges, structured check-ins and messaging support, giving patients regular encouragement and accountability. These programmes can be integrated into existing long-term condition pathways, helping identify patients at risk, reinforce self-management and reduce deterioration. The workshop focuses on adaptation across low-, middle- and high-resource settings, helping delegates understand how to implement this approach within their own operational, cultural and resource context.

Objectives: Participants will be able to: 1. Understand core features of digital lifestyle coaching models. 2. Identify patient cohorts most likely to benefit. 3. Integrate coaching within LTC pathways and population-health strategies. 4. Address digital inclusion and engagement challenges. 5. Adapt deployment strategies to local resources and digital maturity.

Teaching method and workshop: Short presentations on behaviour change, patient selection and workflow integration. Mentimeter activity: delegates identify their biggest barriers to lifestyle behaviour change in their populations. Small-group discussion exploring how coaching could be adapted to differing contexts. Facilitator examples demonstrating scalable implementation models. Workshop schedule 0–10 min: Global behavioural health pressures 10–20 min: Components of digital coaching programmes 20–35 min: Mentimeter + reflection 35–50 min: Implementation and inclusion strategies 50–60 min: Key takeaways & Q&A.

Expected outcomes: Participants gain a practical, adaptable framework for introducing digital lifestyle coaching, improving patient self-management and strengthening long-term condition management.

Conclusion: This workshop offers a scalable, context-sensitive pathway to supporting behaviour

change in primary care, enabling delegates to improve outcomes and reduce system pressure.

ID 2190 - From Consultation to Community: How Can GPs Act on Social Determinants of Health? Lessons from Europe

Deborah LAUWERS [(1)] , Géraldine LAYANI [(2)], Maria Pilar ASTIER-PEÑA [(3)], Karolina GRIFFITHS [(4)]

(1) Unité De Recherche En Soins Primaires, Université Libre De Bruxelles, Bruxelles, Belgique,
(2) Centre De Recherche Du chum, Montréal, Montréal, Canada,
(3) : Public Healthcare Service Of Aragon (spain). Wonca World President Elect, Aragon, Espagne,
(4) Université De Montpellier, Montpellier, France

Context: Chronic non-communicable diseases are a major and growing challenge for primary care. Although general practitioners (GPs) routinely address lifestyle factors, these behaviours are strongly influenced by social determinants of health (SDH), including income, housing, education and social isolation. Interventions that fail to consider these determinants are often ineffective and may increase health inequalities. Nearly 40 years after the Ottawa Charter, many GPs still ask a pragmatic question: what can we actually do in daily practice to address SDH? Across Europe, innovative primary care models are emerging that go beyond the consultation room. This workshop explores concrete examples, including 'health care mediation' programmes in France, 'social prescribing' initiatives in Spain, the ‘medical houses’ model in Belgium and 'innovative community outreach' initiatives in Quebec.

Objectives: Improve understanding of SDH and their impact on chronic disease management Share practical and transferable primary care models addressing SDH Encourage reflection on the evolving social and community role of GPs.

Teaching method and workshop: The workshop will use an interactive, participatory format. Participants will be divided into four small groups, each analysing a real-world European case study (as cited in introduction). The theoretical concepts of SDH, impacts on care pathways of chronical conditions, etc. will be addressed in an experiential way. Participants will gain an in-depth understanding of how the strategies presented can or cannot influence the SDH. Moderators will facilitate discussion around feasibility, transferability and challenges in routine care. A plenary session will allow groups to share insights and practical lessons. 5 min – Welcome and presentation of the topic 35 min – Small-group case study analysis and discussion 20 min – Plenary feedback, shared discussion and exchange of experiences

Expected outcomes: Participants will leave with concrete examples, practical ideas and increased confidence to understand the application of social determinants within their own practice settings, despite time and organizwithin their own practice settings, despite time and organizational constraints.

Conclusion: Addressing social determinants of health is an essential component of primary care. By drawing on experiences from France, Spain, Begium and Quebec, this workshop aims to translate principles into action and support GPs in delivering more equitable, socially, socially responsive care across Europe.

(2) University Of South Wales, Wales, Royaume-Uni,
(3) Community Medicine And Primary Care, University Federico Ii-Naples, Naples, Italie,
(4) Linnaeus And Riga Stradins Universities, Lund, Suède,
(5) Iue Faculty Of Medicine, Izmir, Türkiye,
(6) Kütahya Health Sciences University Evliya Çelebi Training And Research Hospital Department Of Family Medicine, Kütahya, Türkiye,
(7) Hacettepe University Faculty Of Medicine, Department Of Family Medicine, Ankara, Türkiye,
(8) Local Health Unit Of Trás-Os-Montes And Alto Douro, Vila Real, Portugal

Context: The World Health Organisation defines health as a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity. Historically the focus of healthcare delivery has been on diagnosing and treating disease, however there is a growing interest in Social Prescribing. Social Prescribing is a means to

refer people with social, emotional or practical needs to sources of non-clinical support in community settings to improve mental health and physical wellbeing; using a holistic and personalised approach, it focuses both the wider determinants of health and individual needs to give people greater control of their own health and wellbeing. Members of the WONCA SIG SPCO have been successful on gaining European research funding to understand and develop good practice for social prescribing.

Objectives: The aim of the workshop is to develop a framework for research priorities to take forward in the coming years.

Teaching method and workshop: Presentations will be given on the role of the SPCO within WONCA Europe and its members and on the current successful funded research projects. Using a modified nominal group technique to discuss and decide on potential research priorities for the group to be taken forward.

Expected outcomes: The workshop is to gain insight into the potential research needed to develop social prescribing within European countries and communities from a practitioners and community perspective.

Conclusion: In conclusion, the workshop summarizes key research priorities in social prescribing, highlighting the need for inclusive and collaborative research to strengthen evidence, support effective practice and promote sustainable implementation.

ID 2220 - Training tomorrow's family doctors in a virtual clinic today

Katarzyna NESSLER [(1)], Pavlo KOLESNYK [(2)] , Alex HARDING [(3)]

(1) Department Of Family Medicine, Jagiellonian University Medical College,, Kraków, Pologne,
(2) Department Of Family Medicine And Outpatient Care, Uzhgorod Natioanl University, Uzhgorod, Ukraine,
(3) University Of Exeter Medical School, Exeter, Royaume-Uni

Context: As medical education faces the challenge of training an increasing number of future family doctors (FDs), we must innovate to expand clinical teaching capacity without compromising educational quality. This workshop introduces the concept of utilizing virtual clinical settings as an extension of physical teaching capacity. We pose the question in the beginning: “How many students can you accommodate in your clinical practice for teaching at once as one mentor?”

Objectives: This workshop aims to explore how to increase the number of students gaining exposure to general practice teaching by using virtual clinical settings while maintaining or enhancing the quality of the educational experience.

Teaching method and workshop: Participants will be invited to actively engage as "students" in a real-life virtual consultation conducted by an experienced general practitioner mentor and the patients in the real practice. This practical demonstration will showcase the logistics, technology, and pedagogical techniques required to facilitate effective group teaching. The focus will be on maintaining interaction, facilitating reflective practice, and ensuring adequate observation opportunities for all attendees.

Expected outcomes: The core of the session will be a facilitated discussion focusing on the feasibility and possible limitations of the suggested method. Participants will provide crucial feedback on the perceived pros and cons of virtual clinical teaching.

Conclusion: By the end of this session, participants will have a clearer understanding of the possibilities and practical limitations of incorporating virtual clinical consultations into their family medicine training programs. Take-home notes will be outlined.

ID 2249 - Family Medicine in Protracted Crises: Responsibility, Solidarity and the Practice of Care

Dimitrios VASILAKIS [(1)] , Martha KARYDA [(1)], Gabriele GAZZANEO [(2)]

(1) Health Care Center Of Agia Varvara, Heraklion Crete, Grèce,
(2) University Of Modena And Reggio Emilia, Modena, Italie

Context: Violent conflicts and prolonged crises increasingly undermine primary healthcare systems, generating forced displacement, poverty, and fragmented service delivery. In such settings, family doctors are often the most accessible and continuous point of care, while facing profound ethical, clinical, and organisational challenges. These contexts test core principles of family medicine, including equity, continuity of care, and commitment to the social determinants of health.

Objectives: Participants will be able to: 1. Identify key ethical and professional challenges faced by family doctors in protracted crisis settings. 2. Describe the main legal and ethical frameworks protecting healthcare workers and facilities in situations of crisis. 3. Analyse how disruption of primary care affects equity and social determinants of health. 4. Reflect on strategies to support professional responsibility, solidarity, and ethical decision-making under extremeconstraints.

Teaching method and workshop: The workshop will combine short expert inputs with experience-based narratives and facilitated plenary discussion. Teaching methods will include brief structured presentations, practice-based reflection, and guided discussion to promote peer learning and transferability across European contexts • Introduction (5 minutes) • Ethical and legal foundations of healthcare protection in protracted crises (10 minutes): contribution by an independent UNvappointed expert in international humanitarian law and human rights • Primary care practice under extreme constraints (10 minutes):testimony from a family doctor working in a protracted crisiscontext • Operational challenges and professional integrity in humanitarian primary care (10 minutes): reflections from a project coordinator working with an international medical humanitarian NGO • Facilitated plenary discussion (20 minutes), focusing on responsibilities, transferable lessons, and implications for European family medicine • Conclusion (5 minutes)

Expected outcomes: Participants will gain increased awareness of ethical and professional responsibilities in crisis settings, improved understanding of how system disruption affects equity and access to care, and transferable insights to inform clinical practice, education, and advocacy within European primary care.

Conclusion: This workshop offers a structured educational space to engage with ethical, legal, and professional dimensions of care delivery in protracted crises. Beyond clinical and organisational challenges, it addresses the ethical implications of professional and institutional silence, a topic increasingly discussed within the global health and medical literature, and encourages an active, equity-oriented professional stance.

Corresponding author: Dimitrios Vasilakis, dim.vassilakis@gmail.com

ID 2251 - Health Care for All: Persistent Barriers for Marginalized Populations and Crisis-Driven Disruptions

Matic MIHEVC (1) , Tina VIRTIČ POTOČNIK (2), Tanja KAMIN (3), Marija PETEK ŠTER (1)

(1) Department Of Family Medicine, University Of Ljubljana, Ljubljana, Slovénie,
(2) Community Health Centre Ljubljana, Ljubljana, Slovénie,
(3) Faculty Of Social Sciences, Ljubljana, Slovénie

Context: Access to healthcare is a universal concern, yet its challenges are unevenly distributed. While the general population may face disruptions during crises such as the COVID-19 pandemic, marginalized populations including Roma and non-native-speaking communities experience persistent barriers even in routine care. These obstacles affect preventive services, chronic disease management, and care continuity. This workshop examines strategies to promote equitable access, maintain continuity, and foster collaborative practice, framed through the WONCA 2026 conference themes of Liberty, Equality, and Fraternity.

Objectives: By the end of this workshop, participants will be able to identify barriers to healthcare access, describe challenges during healthcare crises, propose strategies for equitable chronic and preventive care, and apply collaborative approaches reflecting Liberty, Equality, and Fraternity.

Teaching method and workshop: The workshop will start with a ten-minute introduction framing healthcare access through the principles of Liberty, Equality, and Fraternity. This will be followed by presentations of two European-funded projects. Project XXX will demonstrate strategies to maintain chronic disease care during crises using a hybrid care model for patients with type 2 diabetes and heart failure in XXX, combining patient portals, video consultations, and remote monitoring. Project XXX will focus on improving preventive care for marginalized populations, presenting a targeted diabetes program for Roma and migrant communities in XXX that integrates community outreach, culturally tailored education, and multidisciplinary care teams. Participants will then engage in small group discussions to develop practical, integrated solutions, and the session will conclude with a plenary discussion sharing insights and key takeaways for application in everyday practice.

Expected outcomes: Participants will gain practical strategies to improve access to preventive

and chronic care for marginalized populations and during crises. They will strengthen interprofessional collaboration, exchange best practices, and acquire concrete methods to embed the principles of Liberty, Equality, and Fraternity in clinical practice.

Conclusion: This workshop positions equitable access as a cornerstone of humanistic general practice. By combining preventive, chronic, and crisis-responsive care, it fosters collaborative, inclusive, and patient-centred healthcare that addresses both everyday inequalities and the heightened challenges of crises.

Corresponding author: Matic Mihevc, matic.mihevc@gmail.com

ID 2275 - Are you on the brink of burnout? And your colleagues? Learn to spot burnout among colleagues and provide timely support.

Odile BOURGEOIS [(1)] , Jean THEVENOT [(1)], Bruno CHICOULAA [(2)], Jordan BIREBENT [(2)], Leila LATROUS [(2)], Michel BISMUTH [(3)]

(1) Association Mots, Toulouse, France, (2) Dumg Université P. Sabatier, Toulouse, France, (3) Association Csf, Toulouse, France

Context: Burnout affects many healthcare professionals, undermining both quality of care and team well-being. General practitioners play a pivotal role in detecting burnout early and supporting colleagues in distress. This lively interactive workshop will teach you the skills you need and show how to develop effective intervention strategies.

Objectives: By the end of the workshop, participants will be able to: - Define the concept of “Burnout.” - Identify early signs of burnout among healthcare professionals and associated risk factors. - Apply and formalize approaches for alerting and supporting colleagues using active listening and empathy. - Share and adapt resources and support systems to their local healthcare organizations.

Teaching method and workshop: This one-hour interactive workshop is led by at least three facilitators: a GP with deep expertise in identifying and treating burnout and two GPs skilled in pedagogy and facilitating groups The session is structured as follows: - Introduction: Overview of the workshop and facilitators (5 min) - Phase 1: Brief interactive lecture introducing key burnout concepts (10 min) - Phase 2: Participants analyze 2 filmed clinical scenarios to identify burnout symptoms and risk factors, discuss alert strategies, and formalize best practices (20 min) - Phase 3: Participants review 2 filmed scenarios and jointly develop strategies to support professionals in distress, integrating active listening, empathy, and referral to existing resources (20 min) - Conclusion: Key Take-aways (5 min) The workshop blends discussion, case analysis, and joint development of practical solutions, encouraging learning by doing focused on real-world application.

Expected outcomes: Participants will acquire practical skills to detect burnout early, provide empathetic alerts, and mobilize appropriate support. The methods and approaches are directly transferable to local healthcare settings.

Conclusion: By promoting interaction, collective reflection, and practical learning, this workshop equips participants with effective tools to reduce the impact of burnout, strengthening collaboration between healthcare professional and solidarity within primary healthcare organizations.

ID 2308 - Complexities in Health

Joachim STURMBERG

Foundation President, Isscsh, Newcastle, Australie

Context: Clinical practice in family medicine rarely resembles the clear-cut cases found in textbooks or hospital wards. Patients rarely present with a single, isolated problem; instead, they bring intertwined medical, psychological, and social challenges that resist simple solutions.

Objectives: Yet much of the evidence guiding our “best practice” comes from research that deliberately excludes such complexity in pursuit of controlled conditions and singular variables. These gaps between real-life practice and research highlight the need to embrace complexity thinking — an approach that better reflects the realities of everyday care.

Teaching method and workshop: Complexity thinking offers practical ways to make sense of the uncertainty and interconnectedness of general practice. In the consultation, it encourages clinicians to look beyond disease management toward understanding relationships, context, and adaptive responses — seeing how small interventions can have large ripple effects across a person’s life. From a research perspective, complexity science reshapes how we design studies in family medicine: valuing

context, feedback, and emergence rather than reductionist control.

Conclusion: This session will introduce these ideas through clinical and research examples, showing how embracing complexity can enrich care, deepen understanding, and make research more relevant to the realities of primary care.

ID 997 - Working with Positive Health supports Doctors' health and well-being, this is crucial for the (Future) of the Healthcare Workers

Karolien VAN DEN BREKEL-DIJKSTRA [(1)] , Solfrid SIQVELAND [(2)], Machteld HUBER [(3)]

(1) Positive Health International, Utrecht, Pays-Bas, (2) Rosendal Helsesenter, Rosendal, Pays-Bas, (3) Institute Positive Health, Driebergen, Pays-Bas

Context: The healthcare crisis we are facing today, with increasing pressure on costs and capacity in European healthcare systems, is leading to greater work pressure and rising burnout rates among healthcare workers. With the new SIG for Doctors Health & Well-being there is a need to learn more on ways for healthcare workers to find and maintain their passion for this invaluable work. How can we create a paradigm shift centered on patients and communities, focused on prevention and holistic healthcare models, and what would this mean for the job satisfaction of healthcare workers? How can this be embedded in education of the (young) doctors.

Objectives: Learn how to apply Positive Health for the (young) doctors themselves and in conversations with the patients. Experience with an imagination method how to create a mindset change about the challenges we are facing today, based on the project "the future of the healthcare workers" in a variety of european countries. The participants will experiences how to create a shared vision for systemic change together, by roleplaying a variety of actors of the health care system.

Teaching method and workshop: Explanation of the concept of Positive Health on individual and on collective level. (10 min) Fill in your own spiderweb, watching a video of an example of a Positive Health conversation between doctor and patient and share in groups of 3 about the learnings (15 min) With the backcasting imagination method a new narrative for future healthcare workers will be envisioned in groups of 8-10 (25 min), discussion and take home messages (10 min).

Expected outcomes: Learn to use the tool of Positive Health. What is important for your own health and awareness and how to use this in conversations in patients. Create a mindset change, not wanting to fix patients problems, but being empowerd by another possible future where healthcare is deeply embedded in communities, fostering a sense of shared ownership and responsibility for health outcomes.

Conclusion: Positive Health for yourself, on individual and collective level can support for the health & well being of the (young) doctors and generate new narratives towards more compassionate and resilient healthcare workers.

ID 2142- Agentic AI-Enabled Recall for Long-Term Condition Management: A Multi-Site Evaluation

Sian KNIGHT [1] , Tom RATCLIFFE [1], Belinda ROELOFS [2], Mina GUPTA [1], Nina JHITA [1], Vincent SAI [1]

(1) Modality Partnership, Nationwide, Royaume-Uni
(2) Liberate Ai, Nationwide, Royaume-Uni

Context: Long-term condition (LTC) management is a major driver of clinical workload in primary care. Traditional recall processes are often manual, inconsistent and slow, contributing to delays in care and inequalities in patient engagement. In 2025, multiple UK primary care sites implemented an agentic AI-enabled recall system to streamline asthma reviews, reduce unwarranted variation and prioritise patients based on clinical need.

Objectives: To evaluate the impact of an AI-enabled digital recall pathway on: Patient engagement and completion of LTC reviews Administrative workload and appointment demand Consistency of clinical coding and review quality Equity of access across age groups Operational efficiency and capacity release.

Methods: A retrospective observational study was conducted using operational data from primary care sites deploying a digital asthma recall pathway. The AI system generated structured questionnaires, analysed responses using condition-specific clinical logic, and produced draft clinical summaries for clinician verification. Outcomes included digital uptake, response rates, appointment utilisation, coding consistency and workflow impact. Descriptive statistics were applied.

Results: Among more than 3,000 asthma patients invited digitally, immediate uptake reached 68%, with overall questionnaire completion exceeding 80%. Engagement increased by 39% among patients <25, a cohort with low participation in traditional reviews. Manual call volumes fell by 91%, releasing substantial administrative capacity. Clinical appointment demand reduced by 41%, with all patients still receiving appropriate clinical review. Time from first invite to completion of annual and medication reviews reduced by 46%. Coding quality standardised across all sites, with 0 coding errors and generating high-quality structured data for population-health management.

Discussion: AI-enabled recall significantly improved efficiency, patient engagement and clinical consistency. The shift from manual to automated review pathways freed capacity for urgent care and complex multimorbidity management. Standardised coding improved data reliability and strengthened the foundation for proactive population-health planning. Variation between sites highlighted the importance of workflow mapping and iterative optimisation.

Conclusion: Agentic AI-enabled recall offers a scalable model for improving LTC management in primary care systems. By enhancing engagement, reducing workload and standardising clinical processes, this approach strengthens safety, equity and population-health capability. This model demonstrates a scalable approach to strengthening primary care delivery and may inform international efforts to modernise primary care.

Corresponding author: Sian Knight, sian.knight3@nhs.net

ID 2132- Ambient Voice Technology in Primary Care: Impact on Documentation Burden, Consultation Quality and Clinician Wellbeing

Tom RATCLIFFE [1] , Vincent SAI [1], Hannah ALLEN [2], Mina GUPTA [1], Nina JHITA [1]

(1) Modality Partnership, Nationwide, Royaume-Uni
(2) Heidi Health, Nationwide, Royaume-Uni

Context: Primary care clinicians face high documentation burden, averaging more than 13 hours per week of administrative tasks, contributing to burnout, reduced job satisfaction and after-hours workload. Ambient AI-enabled scribing has emerged as a potential solution to improve efficiency, reduce cognitive load and enhance consultation quality. The programme assessed implementation of ambient AI technology in General Practice to evaluate its effectiveness, safety and patient acceptability.

Objectives: To assess the impact of ambient AI scribing on: Documentation time during and after consultations Clinician wellbeing Quality and accuracy of clinical notes Patient experience and

consultation rapport Scalability and safety in routine practice.

Methods: A mixed-methods observational evaluation was conducted across multiple primary care sites serving approximately 500,000 patients. Quantitative data included utilisation metrics, consultation time saved, documentation time reduction, wellbeing indicators and safety outcomes. Qualitative data included clinician and patient feedback. Evaluation encompassed thousands of AI-enabled consultations during pilot and scaled rollout phases.

Results: Across 47 clinicians completing 2,879 AI-enabled consultations in the initial phase, documentation burden reduced substantially: 51% reduction in in-consultation documentation time 61% reduction in documentation completed after hours 63% reported completing clinics faster These effects persisted during wider rollout, with 1.2 million minutes of consultations recorded and approximately 17,000 consultations transcribed each month, saving 530 hours of clinical time monthly. Wellbeing outcomes included: 45% higher satisfaction with work–life balance 58% reduction in documentation-related stress Quality and safety indicators strengthened: note-quality satisfaction increased by 38% confidence in accuracy improved by 33% no safety incidents reported Patient experience was positive, with clinicians reporting improved rapport and patients describing feeling more listened to.

Discussion: Ambient AI scribing substantially reduced administrative workload and improved both clinician wellbeing and documentation quality. Adoption varied between users, highlighting the importance of training and cultural readiness. Improvements were observed across clinicians with varying digital confidence, indicating strong potential for broad adoption. Safety remained high through clinician-in-the-loop verification and structured governance.

Conclusion: Ambient AI scribing is a safe, scalable and high-impact intervention that reduces documentation burden and enhances quality of care. This model demonstrates a scalable approach to support workforce sustainability in primary care and may inform international efforts to modernise primary care.

Corresponding author: Tom Ratcliffe, tom.ratcliffe@bradford.nhs.uk

ID 2081- Impact of an AI-Enabled Triage System on Access, Demand Management and Automation in Primary Care

Vincent SAI, Mina GUPTA, Nina JHITA, Tom RATCLIFFE, Sian KNIGHT

Modality Partnership, Nationwide, Royaume-Uni

Context: Primary care systems internationally face increasing pressure from rising demand, constrained workforce capacity and growing administrative burden. Traditional telephone and face-to-face access routes struggle to manage high volumes effectively, contributing to delays and unmet need. In 2024 we started widespread implementation of AI-enabled digital triage systems to support more timely, structured and equitable access. Digital inclusion support was provided to ensure equitable access across diverse population groups.

Objectives: To evaluate the impact of an AI-enabled triage system on: 1. Patient demand patterns and automation rates 2. Response times to patient requests 3. Proportion of requests managed within clinically appropriate timeframes 4. Operational efficiency across participating sites

Methods: A retrospective observational study was conducted across multiple primary care sites serving approximately 500,000 patients, using routinely collected operational data. All patient-initiated requests submitted through the AI-enabled triage system over a 12-month period were included. Requests were categorised as medical or administrative. Outcomes included automation rate (%requests resolved without human intervention), mean clinician response time, and appointment allocation patterns. Descriptive statistics were used to analyse trends across the study period.

Results: A total of 425,500 patient requests (73.6% were medical, 17.1% administrative, 9.3% othe) were processed. Automated clinical decisioning resolved 40% of medical requests, with some sites reaching automation rates >90%. For requests requiring human review, the mean response time from the clinical inbox was 48mins. Across all

request types, 76% patients were offered or received appropriate care within one week. Medical requests required an average of 3m42s for completion by clinicians across all pathways. The system enabled redistribution of workload based on urgency and ensured consistent triage outcomes across sites.

Discussion: The introduction of AI-enabled triage demonstrated substantial potential to improve access, reduce administrative burden and improve consistency within primary care. Automation contributed to significant workload reduction, while maintaining rapid response times. The consistency of overall outcomes across varied practice environments suggests strong potential for transferability to other primary care systems.

Conclusion: AI-enabled triage systems can enhance responsiveness, consistency and efficiency in large primary care settings. This model demonstrates a scalable approach to strengthening primary care digital delivery and may inform international efforts to modernise primary care.

Corresponding author: Vincent Sai, vincent.sai@nhs.net

ID 1721- Effectiveness of AI in collecting medical history

Marc BESNIER

Poitiers, Poitiers, France

Context: Artificial intelligence (AI) is experiencing massive growth in today's world. It is gradually becoming established in healthcare. Administrative tasks such as collecting patient histories can be burdensome and tedious for practitioners. However, these tasks are essential for proper patient follow-up. The use of automated tools such as AI could improve the daily lives of doctors if it proves to be effective.

Objectives: Is AI at least as effective as practitioners at gathering patient histories?

Methods: Prospective study comparing medical histories taken by private general practitioners and by AI during the same initial consultation with a new patient. Practitioners were contacted via social media and professional associations. Medical histories were received anonymously by the investigator. Nabla software was used to standardize the use of artificial intelligence. As this software has a free trial version, no funding was required. A request was made to the local ethics committee, which issued a favorable opinion.

Results: 204 practitioners submitted a total of 942 patient files with medical histories completed by themselves and by artificial intelligence. With regard to pediatric populations (<18 years of age), no significant differences were found other than in family and allergic histories. The 19-35 and 36-65 age groups showed a difference in medical, surgical, obstetric, and allergy histories, as well as family histories. The 66+ age group showed the same result, with the addition of a difference in long-term illnesses. Artificial intelligence systematically found at least as many, if not more, medical histories than the practitioner.

Discussion: Artificial intelligence is effective at collecting patient histories. It is even superior in many areas, particularly when it comes to collecting family and obstetric histories or non-drug allergies. This tool could save us valuable time during these initial interviews. Better medical record keeping is an essential part of follow-up and prevention. Strength: prospective, anonymous study across different regions, large sample size Weakness: recruitment bias due to voluntary participation, possible reporting bias, Nabla software may have intrinsic collection biases.

Conclusion: Even though AI seems promising, we must approach it with caution, respecting ethical rules and keeping the patient's interests in mind.

ID 817- Clinical validation of a retrieval augmented medical LLM for primary care

Guillaume MARTIN [(1)] , Driss BERDAI [(2)], Jean-Philippe JOSEPH [(2)], Pierre-Clément THIEBAUD [(3)], Louis LÉTINIER [(1)]

(1) Synapse Medicine, Bordeaux, France
(2) Bordeaux University Hospital, Bordeaux, France
(3) Assistance Publique Hôpitaux De Paris, Paris, France

Context: Large language models tools are increasingly used by clinicians to access medical knowledge, interpret guidelines, and support

decision making. Yet most available tools are general purpose, insufficiently validated, not transparent in their sources, and not adapted to national clinical contexts. This raises concerns for safety, trust, and applicability in primary care. There is a growing need for sovereign, clinically aligned AI tools designed specifically for healthcare professionals and rigorously validated. XXX was developed in this context, combining generative AI with retrieval augmented generation across >100 curated French medical sources (HAS, ANSM, scientific societies). Preliminary benchmarking showed XXX achieving high scores (>80/100) and outperforming ChatGPT-5 on the 2023 national medical exam (ECNi) by +5 points, supporting further structured evaluation. The present validation study is conducted with an independent team of clinical researchers from two French university hospitals.

Objectives: The primary objective is to estimate the proportion of XXX answers rated pertinent and exhaustive (Likert ≥4/5) by independent expert physicians. Secondary objectives assess partially pertinent answers (Likert =3), erroneous or off-topic answers (Likert ≤2), severity of hallucinations, inter rater agreement, and performance variations across query types and clinical domains.

Methods: This retrospective observational diagnostic study uses anonymised real-world questions asked by healthcare professionals using XXX. A stratified random sample will ensure representation of diverse primary care contexts. Retrospective answers will be blindly assessed by two independent experts physicians using standardised Likert scales (third reviewer in case of disagreement). Analyses will include descriptive statistics, score distributions, Cohen's κ for inter-rater agreement, and exploratory analyses to identify factors associated with lower performance. The target sample (≈150-250 queries) ensures 5-10% precision for the primary estimate.

Results: Expert assessments and full analysis are currently being made, and will be completed by April 2026. Results including primary and secondary outcomes and exploratory analyses will be available for presentation at WONCA Europe 2026.

Discussion: This study will provide the first structured clinical validation of a French, retrieval-based conversational AI dedicated to healthcare professionals and aligned with national medical practice.

Conclusion: Findings will inform clinicians and policymakers on the opportunities and limits of dedicated medical converational AI tools based on LLMs in primary care.

Corresponding author: Guillaume Martin, guillaume@synapse-medicine.com

ID 858- Uptake of clinical decision support systems among healthcare professionals in six European countries and the USA: A cross-sectional survey within the I-CARE4OLD project

Collin EXMANN [(1)] , Anna-Maria HILTUNEN [(2)], Multiple Authors(>10 Allowed) MULTIPLE AUTHORS-THE ICARE4OLD CONSORTIUM [(3)], Hein VAN HOUT [(1)], Johanna DE ALMEIDA MELLO [(4)]

(1) Department Of General Practice, Amsterdam Umc, Vrije Universiteit Amsterdam, Amsterdam, The Netherlands, Amsterdam, Pays-Bas
(2) Nordic Healthcare Group, Helsinki, Finland, Helsinki, Finlande
(3) Multiple, Amsterdam, Pays-Bas
(4) Lucas, Center For Care Research And Consultancy, Ku Leuven, Leuven, Flanders, Belgium, Leuven, Belgique

Context: The use of clinical decision-support systems (CDSS), such as clinical decision rules, algorithms, or machine learning (ML) based applications has gained attention in recent years. However, their adoption and effectiveness may vary across different healthcare systems and settings.

Objectives: This study aims to describe and compare the current use of various decision-support and prediction tools in both homecare and long-term care for older people across health professionals from seven different countries.

Methods: This study analysed the survey of a CDSS pilot study in a purposive sample of health professionals working with older adults with complex chronic conditions from seven different countries. The survey included participants' general background information, their current usage of

decision support tools, and attitudes on the potential benefits of CDSS.

Results: A total of 151 professionals participated in the pilot study. Most participants were physicians (56.3%) or nurses (37.7%). Half of the participants were from primary care or homecare facilities, while the other half worked in long-term care. Our results show significant variation in the adoption and use of decision-support tools across samples from the seven countries. Most currently used CDSS were for diagnostic purposes or concerned guideline implementation, not aimed at prognostic information. In contrast, prognostic tools were most frequently mentioned by respondents as being valuable improvements to clinical practice.

Discussion: While some country samples reported well-integrated digital health infrastructures and higher CDSS adoption rates, others still face challenges in implementing these. However, we found multiple examples of emerging tools. Our findings highlight the need for improvement of current CDSS and development and implementation of particularly predictive CDSS.

Conclusion: This study collected the experiences with CDSS of healthcare professionals in a purposive sample across seven countries. We found that CDSS usage varied across countries with a limited uptake in general, and especially for predictive CDSS. Participants mentioned multiple examples of CDSS they used, mostly for diagnostic rather than predictive purposes. Nevertheless, many professionals reported that predictive tools informing them about patients' health and intervention outcomes would be most beneficial. This highlights the need for further implementation of current systems and the development of more predictive CDSS.

ID 509- The role of AI solutions for patient self-triage prior to a potential visit to the family medicine clinic

Maja ARZENŠEK [(1)] , Nataša MAGUŠA LORBER [(1)], Zalika KLEMENC KETIŠ [(2)], Dejan DINEVSKI [(2)]

(1) Phc Dr. Adolf Drolc Maribor, Maribor, Slovénie
(2) University Of Maribor, Maribor, Slovénie

Context: Primary care systems worldwide, including in Slovenia, face increasing workload due to rising numbers of consultations, diagnostic demands, and administrative tasks, while the healthcare workforce continues to decline. These pressures reduce patient access, increase waiting times, and contribute to burnout among healthcare professionals. Artificial intelligence (AI)–supported self-triage tools have emerged as a potential digital solution to optimize patient flow, reduce unnecessary visits, and improve safety and efficiency in family medicine.

Objectives: To summarize current evidence on AI-supported self-triage tools, evaluate their potential role in primary care, identify benefits and limitations, and explore considerations for potential implementation in Slovenian family medicine settings.

Methods: A narrative review of published studies, feasibility assessments, and performance analyses of AI-based symptom checkers and triage tools (including ODISSEE, MayaMD, CAREPOI, QUI, Babylon, and Infermedica VTCR) was conducted. Key dimensions were extracted: diagnostic/triage accuracy, safety, usability, user characteristics, integration challenges, and implementation requirements.

Results: AI self-triage tools demonstrate promising but variable performance, with reported triage accuracy ranging from 69% to 97%, high sensitivity for identifying urgent conditions, and strong user acceptability. Some tools show comparable or superior triage accuracy to clinicians in controlled scenarios, while others reveal safety concerns and inconsistent diagnostic reliability. Studies indicate reductions in unnecessary in-person visits (up to 12.5%) and improved patient self-management (up to 25%). Users tend to be younger, more educated, and digitally literate. Successful implementation depends on effective integration with existing IT

systems, leadership engagement, and clinician training.

Discussion: AI-assisted self-triage offers opportunities to reduce primary care workload, enhance early detection of urgent conditions, and empower patients through structured symptom reporting. However, challenges remain regarding diagnostic precision, population-specific reliability, over-triage tendencies, and the need for regulatory and safety frameworks. Slovenian primary care, characterized by increasing demand and workforce shortages, could benefit from such tools, but requires robust clinical validation, national guidelines, and adequate digital infrastructure.

Conclusion: AI-based self-triage tools hold substantial potential to support Slovenian primary care by improving efficiency, safety, and patient experience. Before national-level deployment, pilot testing, workforce training, and rigorous evaluation of accuracy, safety, and usability are essential to ensure that such systems complement—rather than replace—the irreplaceable clinical judgement of family physicians.

AI : usage and perspectives

ID 1840- Human factors approach to artificial intelligence in family medicine consultations

Seyma Handan AKYON [(1)] , Richard ROBERTS [(2)], Maud NAUTA [(3)], John BEASLEY [(2)], Roanne OSBORNE [(4)]

(1) Sincan Education And Research Hospital, Ankara, Türkiye
(2) University Of Wisconsin, Madison, Wisconsin, États-Unis
(3) Camden Health Improvement Practice, London, Royaume-Uni
(4) St Cloud Veterans Administration Health Care System, St. Cloud, Minnesota, États-Unis

Context: Family Medicine relies on continuous therapeutic relationships. While digital health technologies support quality and safety, they also contribute to physician burnout by increasing documentation and alert burdens. The introduction of Artificial/Augmented Intelligence (AI) before, during, and after the consultation creates a third actor in care. The resulting doctor–patient–AI triad requires human-centred design and governance.

Objectives: To synthesise Human Factors Science (HFS) evidence relevant to AI in Family Medicine, focusing on principles that protect relationship-centred care and physician wellbeing.

Methods: We performed a focused narrative review using a HFS lens. Findings were organised along the consultation continuum: pre-consultation, during consultation, and post-consultation. The during-consultation phase was further divided into (i) history taking and rapport-building, (ii) data gathering for clinical reasoning and decision support, and (iii) decision making and communicating the plan to the patient.

Results: Across all phases of care, AI can support access, continuity, and clinical work. The most promising gains in relationship-centred care appear during the consultation, where ambient AI and documentation support may reduce administrative burden and save time. If this time is protected, it may contribute to clinician wellbeing and allow greater presence, listening, and empathic engagement, thereby strengthening the doctor–patient relationship. AI-aided clinical decision support systems may also reduce cognitive load by structuring information, supporting differential diagnosis through ranked suggestions, and summarising electronic health records histories and visit outputs to improve situational awareness. However, benefits depend on human oversight at every stage. Key risks include over-reliance, privacy/consent challenges, and transcription or summarisation errors.

Discussion: If time saved is converted into higher throughput rather than protected relational time, potential benefits to the therapeutic relationship may be lost. Implementation, therefore, requires workflow redesign, evaluation including communication outcomes, and co-design with patients and clinicians.

Conclusion: The HFS approach can guide Family Medicine teams so that AI can reduce burden, mitigate automation bias, and protect empathy and trust in the consultation. Keywords: Artificial Intelligence, Human Factors and Ergonomics, Primary Health Care

ID 1603- Who's Using AI Scribes in Primary Care? A Survey of General Practitioners

Christina DERKSEN [1] , Mona YEKEZARE [2], Thomas ROUND [3], Suzanne SCOTT [1], Fiona WALTER [1]

(1) Wolfson Institute Of Population Health, Queen Mary University Of London, London, Royaume-Uni
(2) Barts And The London School Of Medicine And Dentistry, Faculty Of Medicine And Dentistry, Queen Mary University Of London, London, Royaume-Uni
(3) King's, School Of Life Course And Population Sciences, King's College London, Royaume-Uni

Context: General practice is increasingly adopting ambient voice technology ("AI scribes") for summarising and documenting medical consultations. Despite potential benefits in efficiency and accuracy of documentation, concerns persist about safety and data security. Unequal uptake and use of AI scribes might exacerbate existing inequalities, and therefore impact equity.

Objectives: The aim of this study was to examine current use and perceptions of AI scribes among GPs in XXX, and to identify GP, practice, and population factors associated with their adoption.

Methods: We conducted a cross-sectional online survey via a medical research company to explore AI scribe use by GPs (n=598) in XXX and their perceived benefits and risks. We used iterative proportional fitting (raking) of age and current position to improve generalisability. Logistic regression was used to identify factors associated with use, including GP characteristics and local population data retrieved from national statistics. Thematic analysis was applied to open-ended responses.

Results: Use of AI scribes was common (current users: 40%; past users: 23%). Current users used AI scribes for an average of 60% of consultations (range 5-100%). Use of AI scribes was more likely in male GPs (OR=1.64 [95% CI: 1.17-2.31]), those regularly working in private practice (OR=2.88 [95% CI: 1.69-5.10]) and working 5-6 clinical sessions per week (OR=2.17 [95% CI: 1.39-3.40]), those who train others GPs (OR=3.10 [95% CI: 2.10-4.65]), and use XXX IT system (OR=1.65 [95% CI: 1.10-2.48]). Perceived benefits around efficiency and timeliness were endorsed across current, past and never users. Concerns about safety and medicolegal risks were common, especially among past and never users.

Discussion: Use of AI scribes in XXX is relatively high despite regulatory issues and recent official cease communication. Exacerbation of inequalities seems unlikely based on local population characteristics, but use varied significantly depending on GP characteristics.

Conclusion: Therefore, potentially selective use, use of different functions, and patients' perspectives on AI scribes need to be examined to ensure equitable use of AI scribes in future primary care.

(8) Usf Viseu-Cidade, Uls Viseu Dão-Lafões, Viseu, Portugal
(9) Eap 7 Mataró. Ronda Prim. Mataró, Barcelona, Espagne

Context: Artificial Intelligence (AI) is reshaping healthcare, offering tools that can either enhance or threaten the core values of primary care. While AI promises efficiency, unauthorized reliance on algorithms poses risks of bias and depersonalization. To preserve the "human touch" in Family Medicine (FM), practitioners must master not only the technology but also its ethical implications. However, current FM curriculum often lacks a structured framework to teach these essential skills.

Objectives: This review aims to identify and categorize "candidate AI competencies" for FM curricula. It specifically addresses the research question: What knowledge, skills, and attitudes are required for General Practitioners/Family Doctors to use AI effectively while upholding the principles of person-centred comprehensive care?

Methods: A systematic scoping review was conducted, covering the decade from January 1, 2015, to January 1, 2025. Five databases were searched: SCOPUS, WOS, PubMed, EBSCO, and Google Scholar. The search strategy utilized combinations of keywords including "Artificial Intelligence," "Family Practice," "Curriculum," and "Competency." Inclusion criteria focused on articles defining educational frameworks or training interventions for general practitioners/family doctors. A multi-stage screening process was employed: initially removing duplicates, followed by a title/abstract screening, and concluding with a final full-text evaluation to ensure relevance and trustworthiness.

Results: The search revealed a significant surge in literature between 2023 and 2025, driven by Generative AI. Preliminary synthesis identifies three core competency domains: Technical Literacy: Understanding how AI works and its limitations (e.g., hallucinations) to maintain professional autonomy. Ethical Guardianship: Skills to detect algorithmic bias, ensuring equity in patient care. Human-in-the-loop: Using AI as a supportive tool without replacing the empathetic doctor-patient relationship (humanism).

Discussion: The findings suggest that AI competency is not merely technical but deeply ethical. Training programs must shift from elective courses to longitudinal integration. Without these skills, the "fraternity" between doctor and patient risks being disrupted by a "black box" algorithm.

Conclusion: Integrating defined AI competencies into the FM curriculum is essential to future-proof primary care. This review offers a roadmap for educators and policymakers to train physicians who are technically proficient yet defenders of humanism and equity in primary healthcare.

ID 1342- Exploring AI Scribes in General Practice: A Qualitative Analysis

Øystein HETLEVIK, Damoun NASSEHI, Jørgen BREIVOLD

University Of Bergen, Bergen, Norvège

Context: General practices in XXXXXX

Objectives: AI-based scribe technologies have, over the past two years, been introduced into general practice at an almost explosive pace, largely driven by technologically enthusiastic clinicians and industry actors. This study explored how AI scribes influence GPs' clinical practice, focusing on their impact on workflow, consultation routines, and professional responsibility, as well as GPs' reflections on how technology aligns with their needs, expectations, and ethical considerations.

Methods: Qualitative, semi-structured interviews were conducted with ten GPs who had used an AI scribe regularly for more than three months. Data were collected in the first quarter of 2025 and analysed using systematic text condensation.

Results: GPs reported that AI scribes saved up to two hours a day of writing notes, reduced stress, and improved the structure of consultations, enabling more attention to the patient and less to the computer. Several felt this enhanced patient engagement, and patient narratives were better represented in the note. Some missed their personal writing style and found the generated text overly standardised. The AI occasionally struggled to capture nuances in complex consultations, and transcription errors or hallucinations occurred, highlighting the need for careful review. Concerns were expressed about data privacy and regulatory uncertainty, but the GPs maintained a stance of critical trust. Most viewed AI scribes as a notable innovation, provided that human oversight of the output remained strict.

Discussion: According to the GPs, AI scribes improve documentation efficiency, reduce workload, and allow GPs to focus more on patients. Whether the perceived time savings are realistic when thorough review is required remains uncertain. However, the scribes also introduce new sources of error and may subtly shift clinical practice through reliance on AI-generated text. GPs did not

describe any deliberate effort to check for information the scribe might miss. Responsible implementation will depend on clear guidelines, training, and further research to safeguard patient-centred care.

Conclusion: GPs emphasised the positive effects of AI scribes and quickly integrated the tool. More research is needed on how patients are represented in AI-generated notes, what information may be omitted, and how the patients' narratives captured by AI may affect equity in general practice.

ID 1162- Family Physician Trainers´ experience and opinions of generative artificial intelligence in primary care in Germany – an online mixed methods study

Andreas Christian DREHER [(1)] , Christine BECKER [(1)], Tanja JÄHNIG [(2)], Bischoff MARTINA [(3)], Förster CHRISTIAN [(4)], Attila ALTINER [(1)], Simon SCHWILL [(1)]

(1) Department Of Primary Care And Health Services Research, Heidelberg, Allemagne
(2) Institute Of General Practice, Ulm, Allemagne
(3) Institute Of General Practice, Freiburg, Allemagne
(4) Institute Of General Practice And Interprofessional Care, Tübingen, Allemagne

Context: With increase of Large-Language-Models (LLM) the focus of its usage and potential in primary care arises. Use of Artificial Intelligence (AI) may increase efficacy and quality of primary care and change the profession and delivery of primary care.

Objectives: Aim of this study was to explore use of AI in daily routine among family medicine (FM) trainers, their attitudes towards AI and their opinion on its potential impact on primary care and postgraduate medical education.

Methods: All registered FM trainers of the competence center for postgraduate medical education XXX (federal state) XXX 2025 were invited to participate in an online survey. The questionnaire consisted of 52 items about sociodemographic, experience with AI-usage, opinions on AI and educational experiences as trainers. It included open text questions. Data was analyzed descriptively an open-texts semi-quantitatively.

Results: A total of 137 FM trainers participated in the survey (response rate 12%), 55% identified as male and 45% as female, with a mean age of 50 years. 75% reported their practices to be fully or predominantly digitalized. AI use was common in private contexts (64%), while 34% reported professional AI use for medical purposes. In total, 43% used AI daily or several times per week. Approximately half used AI for differential diagnosis and/or therapeutic recommendations, and one quarter used it for clinical documentation. Most respondents (91%) anticipated increased healthcare system efficiency through AI. Additionally, 67% notice patients would increasingly consult AI tools before seeking medical care and 82% perceive increasing anxiety related to AI-generated information. One third of trainers address AI use with FM trainees, primarily focusing on application and critical appraisal. 75% endorsed the inclusion of AI literacy in postgraduate medical education curricula.

Discussion: FM trainers already apply AI in clinical tasks and expect further efficiency gains alongside increased patient concerns. They emphasize the need to prepare future family physicians (FP) for competent and critical AI use and strongly endorse integrating AI literacy into postgraduate medical training.

Conclusion: Use of AI-models is increasing among FP and patients. FP see benefits and risks for primary care. AI literacy should be part of postgraduate medical education in FM.

ID 328- The Jargon Avalanche: Mapping the Risks of Terminology Complexity in Primary Care Digitalization

Odi STUMMER [(1)] , Hans THULESIUS [(2)], Thomas FRESE [(1)]

(1) Martin-Luther-University, Halle-Wittenberg, Allemagne
(2) Linnaeus University, Växjö, Suède

Context: The global digital transformation of healthcare, driven by rapid adoption of AI, telemedicine and health data platforms, now severely outpaces regulatory systems' ability to

maintain harmonized terminology, threatening the foundations of evidence-based practice and cross-national comparability. Despite rare successes such as EHR standards (HL7, DICOM), exponential growth in proprietary and undefined terms is producing "terminology complexity" undermining research synthesis, guideline development and patient safety.

Objectives: This study's primary objective is to formally and quantitatively predict the "point of no return" at which regulatory capacity to govern digital health terminology collapses, irreversibly fracturing the evidence base and raising the risk of clinical semantic confusion. The project tests the hypothesis that terminology complexity is accelerating exponentially while regulatory processes remain static or slow, producing an inevitable gap.

Methods: A mixed-methods framework was used. Quantitative cycle and scenario analyses parameterized regulatory cycle durations, terminology growth, and critical complexity thresholds, using 30+ sources, five analytic phases, and cross-jurisdictional (n=17 cycles, five countries) validation. Qualitative data included 24 expert interviews triangulated via a modified Delphi process. Intervention scenarios were systematically modeled for sensitivity and robustness.

Results: Modeling predicts that by Q3 2027 (median probability 76%; range 68–99%), regulatory systems will be outpaced by new, unmappable terms (threshold >384), with technology adoption cycles shrinking to under 15 months, less than half the median 2.5–3 year regulatory development window. Scenario analysis shows even "paused innovation" is insufficient for recovery; only immediate, globally-coordinated registry and harmonization reform can cut risk below 20%. Real-world signals already show a doubling of failed meta-analyses and exclusion of 60–80% of AI studies from guidelines due to undefined terms.

Discussion: Findings indicate a closing global window of 18 to 24 months for action. Policy interventions must prioritize open-access registries, mandatory semantic mapping, and shorter harmonization cycles. Failure to act ensures a phase shift to fragmented, locally divergent digital medicine.

Conclusion: Quantitative analysis demonstrates that digital health's current trajectory will irreversibly degrade evidence-based practice unless urgent, harmonized regulatory innovation is undertaken. Key recommendations include global real-time terminology registries, pre-market mapping, and funding tied to compliance. This roadmap is essential to safeguard patient safety and restore comparability in digital medicine.

ID 956- Awareness, use, attitudes, and perceived needs regarding generative artificial intelligence among primary care professionals in Catalonia

Pau VILURBINA PÉREZ, Jordi ACEZAT OLIVA, Josep BASORA GALLISA, Mònica SOLANES CABÚS, Esther LIMÓN RAMÍREZ, Laia GENÉ HUGUET, Núria CASADO PRADAS, Xavier BAYONA HUGET, Laura CONANGLA FERRIN, Antoni SISÓ-ALMIRALL

Board Of The Catalan Society Of Family And Community Medicine, Barcelona, Espagne

Context: Generative artificial intelligence (GenAI) is rapidly transforming knowledge work in healthcare, yet its penetration into frontline primary care remains poorly understood. Understanding current awareness, readiness, and concerns is essential to guide safe adoption. The Catalan Society of Family and Community Medicine (CAMFiC) conducted a survey to assess how primary care professionals in Catalonia engage with GenAI.

Objectives: To describe the level of awareness, use, attitudes, and perceived training and organisational needs regarding GenAI among primary care professionals in Catalonia.

Methods: An anonymous online cross-sectional survey was distributed to CAMFiC members between 3 and 17 November 2025. The questionnaire covered demographic characteristics, digital access, frequency and context of GenAI use, perceived benefits and risks, organisational support, and preferred training formats. Descriptive statistics summarised responses and explored variation across age, profession, experience, and teaching or leadership roles.

Results: A total of 373 professionals participated (69.2% women), mostly family physicians (89.5%) in urban or semi-urban settings (82.8%). Daily GenAI use was reported by 27.9%, while 52.8% had never used it professionally. Common uses included literature search or synthesis (67%), preparing clinical sessions (37.3%), and drafting or editing text (30%). Among users, ChatGPT was most frequent (80.2%), followed by Copilot (37.8%) and Gemini (24.9%); 17.7% had a paid subscription. Self-rated knowledge was low or very low in 82.6%, and only 20.9% had received formal training. Main barriers were lack of training (80.2%), legal/privacy concerns (55.2%), and poor integration with electronic health records (42.4%).

Discussion: The modest uptake contrasts with the fast expansion of GenAI in other sectors, suggesting primary care may be slowed by structural and regulatory constraints. Interest in documentation and evidence-related uses indicates potential for workload relief, yet widespread knowledge gaps and governance concerns underscore the need for practical training and clear institutional guidance. Improving EHR integration and privacy safeguards may be essential for responsible adoption.

Conclusion: Primary care professionals in Catalonia show limited and uneven GenAI use, significant knowledge gaps, and governance uncertainty, highlighting the need for targeted training and institutional frameworks before large-scale implementation.

Antibiotics

ID 1791- A systematic review of interventions to reduce inappropriate antibiotics use in general practice in OECD countries

Racha ONAISI, Audrey NGEYITADILA-FUKIAKANDA, Léa MAUREL

Department Of General Practice, University Of Bordeaux, Bordeaux, France

Context: Inappropriate antibiotic use (IAU) is a major cause of increased antibioresistance, a phenomenon responsible for over one million annual deaths worldwide and for additional expenses for healthcare systems. More than 75% of antibiotic prescriptions are made by general practitioners (GPs). Various interventions have already been developed and evaluated. This could provide useful insight to build and implement effective interventional programmes to reduce IAU.

Objectives: To assess the efficacity of interventions targeting GPs to reduce IAU in common acute infections in general practice, that were developed and tested in OECD countries.

Methods: We conducted a systematic review of randomized controled trials (RCTs) of interventions aiming at reducing the number of antibiotic prescriptions and/or reducing the duration of antibiotherapy and/or improving the choice of molecules. We followed the PRISMA guidelines (protocole registration Prospero CRD42024603824). Pubmed, the Cochrane Library and Scopus were searched up to February 2024. The eligibility criteria were RCTs conducted among GPs practicing in OECD countries, evaluating interventions targeting GPs to modify their antibiotic prescriptions habits. Control was the absence of intervention or an intervention targeting another prescription behavior Two reviewers independently screened records on Rayyan to apply eligibility criteria and select studies for inclusion. Conflicts were solved through discussion between 2 or 3 researchers. Data was extracted in an Excel Spreadsheet. Cochrane Risk of Bias 2 tool was used for quality assessment.

Results: The search retrieved 1530 articles, of which 27 were included. The RCTs evaluated interventions that involved (i)clinical reminders (n=2), (ii)distribution of educational material (n=2), (iii)communication assistance or training (n=4), (iv)stimulation of reflexivity (n=4), (v)rapid biological testing (n=6) or (vi)multifacetted interventions (n=9). The risk of bias was low or raised some concerns for 16 studies. Multifacetted interventions and rapid biological testing seemed to be the most effective.

Discussion: Despite strong methodology, this work is not without limits, with a risk of selection and publication bias. A meta-analysis is planed after actualisation of the search (ongoing). We did not include pluriprofessional interventions. The efficacy of multifacetted interventions could be related to their action on multiple determinants, and on the reduction of uncertainty for rapid testing.

Conclusion: Interventional programmes should favor multifacetted complex interventions.

Corresponding author: Audrey Ngeyitadila-Fukiakanda, a.ngeyitadila@gmail.com

ID 1087- Is public education on AMR working? Changes in attitudes to sore throat management and antibiotic resistance – results from STAR study 2022–2024

Andy WATSON [1] , Attila ALTINER [2], Alike VAN DER VELDEN [3], Duerden MARTIN [4], Elsa LÓPEZ-PINTOR [5], Aurelio SESSA [6], Gabriela CORNELIA MUSAT [7], Adrian SHEPHARD [1]

(1) Reckitt Healthcare International Ltd., Slough, Royaume-Uni
(2) University Of Rostock, Rostock, Allemagne
(3) University Medical Center Utrecht, Utrecht, Pays-Bas
(4) Cardiff University, Cardiff, Royaume-Uni
(5) Miguel Hernández University Of Elche, Alicante, Espagne
(6) Italian College Of General Practitioners And Primary Care, Florence, Italie
(7) Carol Davila University Of Medicine And Pharmacy, Bucharest, Roumanie

Context: Understanding of how discussions and perceptions amongst patients is changing over time with regards to sore throat management and antibiotic usage is critical to inform interventions that reduce inappropriate antibiotic use, which is particularly high for respiratory tract infections (RTI).

Objectives: To explore changes in antibiotic usage and perception for RTIs over time in multiple countries.

Methods: The STAR study (2022: 12 countries; 2024: 16 countries) is an observational, questionnaire-based study in adults (18–64). Here we report on data from Germany, Spain, Italy, Poland, Romania, the UK, and the Netherlands. Participants had experienced and treated RTI symptoms in the past 6 months. The online questionnaire explored RTI experience, antibiotic use, attitudes, and behaviours toward antibiotics and AMR.

Results: Comparing total populations, the top three reasons for antibiotic usage were cold, flu, and throat infection (59% of all antibiotic usage in 2022 and 61% in 2024), significantly more frequent than all other reasons combined ($p<0.0001$). Overall, reported antibiotic use increased significantly from 2022 to 2024 (55.65% vs 58.74%; $p<0.0001$). Younger adults (25–34) consistently reported higher usage than the total sample (18–64 years) in both years. Agreement that antibiotics kill viruses (a false belief) rose from 55.98% (2022) to 58.45% (2024) $p<0.0001$, with higher agreement among younger adults.

Discussion: RTIs are widely recognised as an area of inappropriate antibiotic use, and these data show high and increasing usage across three predominantly viral RTIs. Misunderstandings persist about antibiotic effectiveness for self-limiting RTIs, despite public health efforts to curb misuse. Younger adults (25–34) continue to report higher usage and misperceptions, highlighting the need for targeted educational interventions for this demographic. A symptom relief-based approach to managing primarily viral RTIs can limit inappropriate antibiotic use and provide benefits antibiotics cannot.

Conclusion: Antibiotic use for predominantly viral cold, flu, and throat infection is increasing, especially among younger adults, underscoring the need for enhanced targeted education and research in, and endorsement of, symptomatic alternatives. Misunderstandings and differing attitudes underpin current trends. GPs and pharmacists are ideally placed to change patient perceptions and expectations on managing RTIs and rationalising antibiotic use.

ID 465- Prevalence and determinants of antibiotic self-medication among outpatients: a departemental study in Seine-et-Marne

Nutte LOUISE [(1)], Camille FALLOUH [(2)], Louise NUTTE [(1)] , Rebecca BAUER [(3)], Florence STORDEUR [(3)]

(1) Maison De Santé Pluriprofessionnelle "pôle Santé Vanvéen", Centre Régional En Antibiothérapie Idf, Vanves, France
(2) Sorbonne Université, Paris, France
(3) Centre Régional En Antibiothérapie Idf, Paris, France

Context: Antibiotic resistance is a major public health issue worldwide and is largely driven by inappropriate use. In XXX, more than 5500 deaths were attributed to infections caused by resistant bacteria in 2015, and up to 238000 deaths are projected by 2050 if no action is taken. Although general practitioners are key actors in antibiotic stewardship, antibiotic self-medication remains insufficiently studied despite its role in resistance development.

Objectives: To assess the prevalence of antibiotic self-medication over the last 12 months and identify its associated factors among adult outpatients in XXX.

Methods: We conducted a descriptive cross-sectional study using a self-administered questionnaire. Inclusion criteria were being over 18 years of age and residing in or attending a healthcare facility in the department of XXX. Questionnaires were distributed in paper form and online. Data were collected over a 60-day period. Statistical analyses compared participants who reported antibiotic self-medication within the past 12 months with those who did not or were unsure.

Results: A total of 1405 respondents were included (91.5% women). The prevalence of antibiotic self-medication in the previous 12 months was 18.7%. Antibiotics used for self-medication mainly came from prior personal prescriptions (89.3%). The main symptoms leading to self-medication were respiratory (38.4%) and upper respiratory tract symptoms (38.02%). Patients who self-medicated were more likely to report a medical appointment delay of over one week than those who did not (37.26% vs. 27.34%, p=0.003) and to keep leftover antibiotics at home (88.97% vs. 63.66%, p<0.01). Patients over 65 were significantly underrepresented in the self-medication group (5.32% vs. 9.63%, p=0.03).

Discussion: These results highlight the need to strengthen prevention at each antibiotic prescription by reminding patients that antibiotics should not be reused without a medical assessment. Measures may include patient education, reinforced counseling by community pharmacists, visual educational materials in waiting rooms, and clear written instructions on prescriptions. Raising awareness of antibiotic self-medication could be an additional lever against antimicrobial resistance, although reducing antibiotic prescribing remains the main challenge, as nearly 50% of prescriptions are considered inappropriate.

Conclusion: Antibiotic self-medication among outpatients remains common in XXX, and this study highlights several determinants on which targeted interventions could be implemented.

Corresponding author: Camille Fallouh, camille.fallouh@hotmail.fr

ID 1115- Optimizing Antibiotic Prescribing in Primary Care by individual feedback

Masja LOOGMAN

Dutch College Of General Practitioners, Utrecht, Pays-Bas

Context: Antimicrobial resistance (AMR) remains a global health threat, and reducing unnecessary antibiotic use is essential. In 2017, the XXX Ministry of Health set the goal to halve inappropriate antibiotic prescribing. Traditional surveillance focused on prescription counts without linking to clinical indications, limiting insight into overprescribing and opportunities for improvement. The SABEL project was initiated to provide indication-linked quality indicators and practical tools for stewardship in general practice.

Methods: Routine care data from GP information systems were analyzed to create 14 QIs, including overall prescribing rates, use of broad-spectrum antibiotics, and first-choice prescribing per indication. These indicators were piloted through pharmacotherapeutic peer group meetings (FTO), combined with tailored education on guideline adherence to make a definitive selection. This selection is used for data drive feedback in FTO sessions. Individual results of GPs are discussed (generated by QIs) and tailored education is given by GP experts to achieve better antibiotic prescribing.

Originality: In this project a set of relevant, feasible quality indicators (QIs) for antibiotic prescribing in primary care was developed. Through QIs we are able to generate individual prescribing patterns.

Furthermore several GPs were trained in XXX to become a reg

Lessons learned and future implication: GPs rated the indicators as highly relevant (88%) and useful (91%). After FTO sessions, 72% expected changes in prescribing behavior. Trend analyses (2018–2023) show stable or improved adherence to first-choice prescribing, despite temporary declines during.

Discussion: This project appears to have a positive effect on antibiotic prescribing in primary care. However, GP participation is voluntary, recruiting GPs is intensive and it's questionable whether the worst performers will volunteer for this FTO.

Conclusion: The SABEL toolkit combines data-driven feedback with peer education to support rational antibiotic use in primary care. This approach strengthens stewardship efforts and can be adapted for other European contexts. Sustained implementation and monitoring are essential to maintain progress against AMR.

Corresponding author: Masja Loogman, m.loogman@nhg.org

ID 65- Shared decision-making process, associated determinants and role of decision aids in antibiotic prescription in general practice: qualitative metasynthesis.

Camille BARDIN [(1)] , Corentin LENON [(2)], Racha ONAISI [(3)]

(1) Médecin Généraliste, La Rochelle, La Rochelle, France
(2) Médecin Généraliste, Mûres, Mûres, France
(3) Université De Bordeaux, Bordeaux, France

Context: Antimicrobial resistance and antibiotics inappropriate use in general practice (GP) are a major issue. Shared decision-making (SDM), that can be enhanced by decision aids (DAs), seem efficient to reduce prescriptions. Their use remains inconsistent. Understanding the processes of patients and physicians SDM and the associated determinants could help improve their implementation.

Objectives: The objective was to explore the determinants of SDM between patients and GPs regarding antibiotic prescription in primary care.

Methods: Systematic review and metasynthesis of qualitative studies that explored SDM about antibiotic prescription in GP. We included published studies focusing on GP consultations for acute infections, involving adult patients (or legal representatives for minors). We searched Pubmed, SCOPUS, PsycINFO, PsycArticle, CINAHL, Socindex, Psychology and Behavioral Sciences Collection. Two reviewers independently assessed the articles for eligibilty, based on titles and abstracts, then full text. Data were analysed following the framework synthesis method. The a priori codebook integrated the SDM, clinical reasoning processes and DAs frameworks.

Results: The search retrieved 437 references, of which 10 were included. SDM was usually limited or absent. Patients' and physicians' respective beliefs and representations were major determinants, with negative impact. A major difficulty was to reach a shared objective. This issue was not addressed by DAs, which mainly provided support to better structure the consultation and provide information. GPs seemed to use DAs mainly as tools to convince patients.

Discussion: Beyond the role of well-known determinants, like personal beliefs, past experiences, our results provide important insight on the importance of establishing clear objectives to the consultation as the indispensable basis to really co-construct the final decision. DAs can help structure a more balanced discussion but remain used mainly as information material. There might be selection and interpretation biases, balanced by using a solid method. Analysis is strengthened by valid frameworks.

Conclusion: To efficiently strengthen SDM, DAs should be oriented towards a global plan of care rather than just antibiotic prescription. They need to help patients and GPs to reach clear shared objectives that should include the need for explanations (notably symptoms and natural course of the illness), reassurance, alternatives, in addition to graphic representation of expected effect of antibiotics.

Context: With the growing population requiring palliative care (PC), it is essential to enhance and expand the availability of this care in Portugal. Throughout both pre-graduate and post-graduate training for doctors, there are limited learning opportunities in this area, necessitating further training to improve the knowledge and skills needed to support patients at the end of their lives. Studies conducted on doctors and medical students have demonstrated a clear need for improved training. Additionally, others have noted significant benefits for residents who underwent post-graduate training in this field while caring for patients nearing the end of life.

Objectives: This study aims to evaluate the impact of a basic training program on improving palliative care knowledge among medical doctors.

Methods: This was a cross-sectional study, carried out by sharing a questionnaire with the participants enrolled in the "Intensive Palliative Medicine Course" organized by a group of doctors in November 2021. The questionnaire was completed by participants at three moments of training (before, immediately after the course, and 6 months after the course), and it contained questions to assess the theoretical knowledge, skills, and abilities obtained.

Results: In total, 93 out of 204 (45.58%) doctors responded before training, 80 (39.21%) immediately after training, and 36 (17.64%) six months after training. After training, an improvement in knowledge was observed ($p = 0.014$), which did not appear to persist six months after the course ($p = 0.574$). However, six months after training, an increase in doctors' confidence in referring patients to Palliative Care Teams or Units ($p = 0.009$) and medicating patients who may be in the last months of their lives ($p = 0.005$) was observed.

Discussion: The results regarding theoretical medical knowledge did not seem to stabilize over time, so it may be necessary to create more specific training opportunities for the medical profession. An increase in doctors' self-confidence in referring and medicating patients with palliative care needs was observed, which may be associated with better medical care provided.

Conclusion: It is necessary to carry out more studies to evaluate the impact of combined theoretical and practical training on the knowledge and confidence of doctors in PC.

ID 2064- Entrepreneurial leadership in general practice: a qualitative study defining its meaning and educational implementation.

David OPPENHUIZEN [(1)] , Nienke BOOGAARD [(1)],

Charlotte NEVE, Eduard SCHMIDT [(1)], Susan MCKENNEY [(2)], Hedwig VOS [(1)]

(1) Lumc, Leiden, Pays-Bas
(2) Universiteit Twente, Enschede, Pays-Bas

Context: Future general practitioners (GPs) face an increasingly complex and unpredictable field. Entrepreneurial leadership can help GPs proactively initiate change and respond with resilience. Thus, we strive to educate the next generation of GPs as change agents and entrepreneurial leaders, emphasizing change as an opportunity rather than a threat. While standard literature and policy documents highlight its importance, research on its role within GP residency programs is scarce. This study explores which forms of entrepreneurial leadership are essential for GP education and practice.

Objectives: To explore what entrepreneurial leadership means to (trainee) GPs and to identify essential themes and practices that should inform the development of future educational interventions.

Methods: We conducted a qualitative interview study involving experienced innovative GPs, early-career GPs (<7 years experience), GP trainers, and third-year residents. Data were analyzed using Abductive thematic analysis in Atlas.ti. We employed both inductive and deductive coding, using a codebook based on Neck's "practices" of entrepreneurship education (play, empathy, experimentation, creation, reflection) and Yukl's taxonomy of effective leadership behavior. The analysis is iteratively sensitized by broader literature on entrepreneurial leadership.

Results: Interviews were conducted with eight experienced GPs and three early-career GPs, and focus groups were conducted with residents (N=2) and trainers (N=1). The analysis links entrepreneurship and leadership by testing the applicability of Neck's and Yukl's models within primary care. Preliminary findings suggest that these educational frameworks provide a structured way to integrate entrepreneurial competencies into the GP curriculum.

Discussion: The integration of entrepreneurial practices such as 'experimentation' and 'empathy' aligns with the evolving role of the GP as a change agent and entrepreneurial leader. These findings clarify the conceptual ambiguity surrounding entrepreneurial leadership in primary care, bridging the gap between policy ideals and the reality of GP practice. Further discussion is needed on how to balance these competencies with traditional clinical training.

Conclusion: The initial results indicate that entrepreneurial leadership is a recognizable and teachable competency for GPs. By defining these core components, this study lays the groundwork for developing targeted educational interventions. Implementing these specific educational practices better prepares future GPs for a non-linear professional environment.

ID 1410- Effect of an interprofessional education programme in multidisciplinary primary care centres on the interprofessional collaboration skills of health students

Laure FIQUET

Université De Rennes, Rennes, France

Context: Interprofessional education (IPE) is important for developing interprofessional collaboration (IPC) skills. In France, multidisciplinary primary care centres (MPCC) are places where IPC practices are developing in primary care and could provide an authentic learning context for healthcare students. A research project XXX aims to evaluate the impact of IPE on healthcare students' acquisition of IPC skills during their placements in MPCCs. The intervention consists of a train-the-trainers program for three professionals from MPCCs, who will be responsible for delivering an IPE module to students.

Objectives: To evaluate the effect of IPE module on healthcare students' acquisition of IPC skills during placements in MPCCs.

Methods: A mixed-methods study among students on placement in 12 MPCCs that are receiving the IPE module (the intervention group) and students on placement in 12 MPCCs without the module (the control group). We will present the results (finalised

in April 2026) of the quantitative study conducted using pre- and post-test questionnaires based on the validated Interprofessional Collaborative Competencies Attainment Survey (ICCAS).

Results: Expected **Results:** A total of 72 students from various health disciplines will complete the ICCAS, 36 students in the intervention group and 36 in the control group. Their ICCAS scores before and after the placement will be analysed. The results of the intervention and control groups will be compared in terms of both the overall scores and the different dimensions of the sub-scores (communication, collaboration, roles and responsibilities, collaborative approach centred on the patient and their family and friends, conflict management and resolution, and teamwork). We will also present the results of family medicine students and compare them with those of other healthcare students. We hypothesise that implementing an IPE module during the MPCC placement will improve students' IPC skills.

Discussion: MPCC placements for health students can provide an opportunity to learn about the IPC. However, major challenges remain in implementing such training programmes, both in terms of course specialisation and in terms of MPCC recognising the importance of welcoming students on internships.

Conclusion: It is necessary to evaluate the IPE in the authentic context of primary care placements for family medicine students and other health students.

ID 1234- A Primary Health Care–Based Transdisciplinary Teaching Model in Global Health

Henna RIEMENSCHNEIDER [(1)] , Luise Lotte KRAMER [(1)], Martin BORTZ [(1)], Anna KUEHNE [(2)], Claudia CZERNIK [(2)], Stephanie TACHÉ [(1)]

(1) Department Of General Practice, Faculty Of Medicine, Tud Dresden University Of Technology, Dresden, Allemagne
(2) Chair In Public Health, Centre For Evidence-Based Healthcare, University Hospital Carl Gustav Carus And Faculty Of Medicine, Tud Dresden University Of Technology, Dresden, Allemagne

Context: Global health challenges are complex and require transdisciplinary collaboration. To foster competencies across disciplines, the Global Health Initiative Spring School (GHISS) was launched in 2023 at XXX University and is held annually. Primary health care (PHC), with its holistic and systems-oriented perspective, anchors the program and ensures adaptability to diverse educational settings.

Methods: GHISS is a one-week blended learning course (35 units) combining e-learning, lectures, interactive group work, and case-based discussions. Participants from medicine, public health, psychology, environmental sciences, geography, and economics collaborate in mixed teams. Curriculum topics include Global Health, Health Systems, Public Health Services, Urban and Planetary Health, Migration, Mental Health, and Community Engagement. Voluntary anonymous online surveys evaluate satisfaction, perceived relevance, and skill development.

Originality: The program uniquely integrates a Primary Health Care (PHC) lens into transdisciplinary teaching. This framework guides participants to analyze complex global health challenges holistically, bridging multiple disciplines while emphasizing systems thinking

Lessons learned and future implication: Structured teamwork, exposure to complex real-world cases, and interprofessional collaboration are key drivers of learning. The model is flexible, scalable, and adaptable to various institutions and international contexts. Future plans focus on establishi.

Discussion: Exposure to transdisciplinary global health education fosters collaboration, critical thinking, and systems-oriented problem-solving. The PHC framework unifies diverse disciplinary perspectives, making complex global issues tangible. Challenges include maintaining engagement post-course and translating learning into practice, highlighting the need for longitudinal follow-up.

Conclusion: Transdisciplinary, PHC-based global health teaching is feasible, effective, and adaptable. GHISS provides a replicable model to cultivate

teamwork, systems thinking, and motivation for addressing global health challenges among students and early-career professionals.

ID 1135- Empowering Future Women Leaders: Implementing an SDG-Aligned Program for Medical Students in Japan

Chiaki MISHIMA, Akinori YAMABE

Jichi Medical University, Tochigi, Japon

Context: Women remain underrepresented in leadership roles in healthcare despite increasing enrollment in medical schools. Early leadership identity formation—especially through a primary care lens emphasizing equity, person-centeredness, and community responsibility—is rarely incorporated into undergraduate education. To address this gap, an SDG-aligned leadership program integrating primary care values was delivered to women medical students.

Methods: A five-session educational intervention was implemented with ten women medical students. The curriculum incorporated SDG principles, primary care frameworks, gender equity, reflective practice, and scenario-based learning. A mixed-methods evaluation approach was employed. Post-session questionnaires assessed changes in leadership self-efficacy, motivation toward medical training, and anxiety about future roles. Reflection assignments and preliminary qualitative interviews explored shifts in understanding of primary care, gender norms, and leadership identity. Data collection remains ongoing.

Originality: The program aimed to cultivate foundational leadership competencies grounded in primary care principles—including continuity, comprehensiveness, equity, and community health—while enhancing SDG literacy and professional confidence. Interactive components

Lessons learned and future implication: Participants reported increased self-confidence, strengthened motivation for medical careers, and reduced anxiety regarding future professional responsibilities. Exposure to primary care values broadened their understanding of leadership, shifting percept

Discussion: This initiative highlights the potential of early, context-sensitive leadership training for supporting future women leaders in healthcare. Limitations include the small sample size, reliance on self-reported data, and incomplete evaluation. Further research is needed to assess long-term impact, scalability, and cross-cultural applicability.

Conclusion: An SDG-aligned, primary care–centered leadership program can enhance leadership identity, motivation, and emotional well-being among women medical students. This model offers a scalable approach for embedding gender equity, community responsibility, and global health values into undergraduate medical education.

ID 1017- Postgraduate medical education ECHO for women's health: Connecting urban and rural general practice residency programs

Elissa PALMER

Kirk Kerkorian School Of Medicine At Unlv, Las Vegas, États-Unis

Context: Introduction: Faculty and administrators from four general practitioner training sites sponsored by the medical schools designed a program to develop the skills needed to participate in a community of practice (Project ECHO- Extension for Community Healthcare Outcomes) through the delivery of an evidenced-based obstetrics and women's health curriculum. The program's goal was to improve progression of general practice residents along postgraduate medical education competencies and to familiarize trainees with ECHO to increase participation after training is completed.

Objectives: Aims: (1) Define the postgraduate medical education ECHO for women's health and virtual platform (2) Analyze how medical schools combined efforts to educate trainees in their urban and rural residency sites (3) Delineate competencies achieved and lessons learned

Methods: Methods: Interactive discussion provides a framework of the current literature with an example for implementation at training sites.

Results: A multipart orientation for the ECHO model and case review process was developed. This was role modeled by the faculty hub team. The hub team also adopted new mechanisms for assigning trainees to review and scribe (document recommendations) for cases. These processes allowed trainees to be assigned to a faculty mentor to help facilitate the filling out of the case review form and ensure fidelity in providing recommendations that were sent to the trainee that reviewed the case during each ECHO. A debrief checklist was utilized to ensure fidelity to our model and served as a rapid cycle quality improvement tool. Each of these tools: the case review form, recommendation form, and debrief checklist utilized a secure web application for building and managing online surveys and databases.

Discussion: The program implementation required more extensive administrative coordination. Survey results support not only increased familiarity with ECHO but also increased likelihood of trainee participation in multiple ECHO programs after training is completed. Ideally, this ECHO may mitigate some of the effects of maternal healthcare deserts in rural areas and result in improved patient health outcomes.

Conclusion: Conclusions: Utilizing the Project ECHO format allowed interaction among distant urban and rural residency training programs to achieve competencies in women's health as a useful model for postgraduate medical education.

Corresponding author: Elissa Palmer, elissa.palmer@unlv.edu

ID 707- Patient-centered care: a quantitative study of the attitude of general medicine residents in the xxx region

Julie JOURNEAU, Arnaud LIONNE

University Of Lille, Lille, France

Context: Patient-centered medicine has become the gold standard in primary care. It has been taught to medical students in most countries since the 2000s. Studies have shown disparities in its practice depending on the country and the year. This study evaluates the practice of patient-centered medicine among general practice residents at the University of xxx. This is the first study of its kind in xxx.

Objectives: The primary objective of this study is to evaluate the practice of patient-centered medicine among general practice residents at the University of xxx. Secondary objectives are to investigate an association between certain demographic factors and the practice of patient-centered medicine, and to compare the results obtained with those of health students from other countries.

Methods: A quantitative observational analytical study using a questionnaire based on the validated Quebec version of the Patient Practitioner Orientation Scale (PPOS) was conducted. We will present the results of this study in our presentation.

Results: The average PPOS score of general practice residents at the University of xxx is 4.48. This score indicates a practice with limited patient-centeredness. The PPOS score is significantly higher for residents who have completed five semesters than for residents at the beginning of their training. Even though this score is significantly higher than the results of a meta-analysis including health students from other countries, it still suggests a less patient-centered approach. General practice residents in xxx, like their counterparts abroad, acquire a more patient-centered practice by the end of their training.

Discussion: This study highlights the role of university teaching and interpersonal skills such as communication and empathy in developing a patient-centered approach.

Conclusion: Replicating this study in a few years will allow us to observe the evolution of patient-centered practice among residents in subsequent years, and expanding it to other departments of general practice would allow us to compare teaching methods and improve them.

Corresponding author: Julie Journeau, julie.journeau@univ-lille.fr

Blood pressure

ID 1709- Impact of Brief Education and Prescription of Home Blood Pressure Monitoring on Patient Adherence According to Guidelines in Primary Care

Marc ISABELLE, Laurent MERCIER, May FIANI

Université De Picardie Jules Verne, Amiens, France

Context: In France, only 25% of hypertensive adults are diagnosed and controlled. The French National Authority for Health (Haute Autorité de Santé, HAS) recommends home blood pressure monitoring (HBPM) for the diagnosis and management of patients with elevated blood pressure, in line with international hypertension guidelines. HAS advises the "rule of 3": three measurements in the morning and three in the evening for at least three consecutive days. Although HBPM is widely adopted by general practitioners and patients with home devices, few patients (<20%) correctly follow these recommendations and report their results to their physician. Whether brief education and prescription of HBPM improve patient adherence remains unclear.

Objectives: To evaluate the impact of brief education and prescription of HBPM within two weeks after consultation on patient adherence to HAS recommendations and reporting of measurements to their physician.

Methods: This prospective, single-center, before–after study (2024-A01263-44, CPP Ouest II) included patients with office systolic blood pressure >140 mmHg performing HBPM at home from March to September 2025. The primary outcome was adherence to HAS recommendations and reporting of HBPM results before and after a brief oral and written educational intervention combined with formal prescription. The primary outcome was expressed as a percentage and analyzed using McNemar's test.

Results: Twenty-three patients were included (mean age 71±10 years; 12 women). Mean office systolic blood pressure was 155±14 mmHg. At baseline, 12 patients (52%) performed three consecutive measurements, 19 (83%) in the morning, 14 (61%) in the evening, and 12 (52%) over at least three consecutive days. Overall, only 8 patients (35%) fully complied with HAS recommendations. Two weeks after the intervention, 20 patients (87%) performed three measurements in the morning and evening for at least three days and reported their measurements to their physician ($p<0.001$).

Conclusion: This real-life primary care study shows that brief education combined with prescription of HBPM significantly improves patient adherence to guidelines and reporting of results. Strengths include its pragmatic design and clinical applicability. Limitations include the small sample size, single-center design, and short follow-up. Further analyses are ongoing to assess whether patient adherence to HBPM recommendations is sustained over time.

ID 1180- SOLO study: A single-pill combination strategy in general practice to optimize blood pressure control in a multi-ethnic community

Willeke NAAKTGEBOREN, Janke STRIJP, Jelle HIMMELREICH, Ralf HARSKAMP

Amsterdam Umc, Amsterdam, Pays-Bas

Context: Hypertension is a major modifiable risk factor for cardiovascular disease, yet blood pressure (BP) control remains suboptimal, particularly in socially disadvantaged communities. Recent guidelines promote initiating single-pill combination (SPC) therapy to improve medication adherence and BP control, but clinical adoption in primary care remains limited.

Objectives: To evaluate the SOLO care improvement project, which promoted SPC initiation among general practitioners in Amsterdam-Zuidoost, a socially disadvantaged, multi-ethnic community in The Netherlands with a high hypertension burden.

Methods: In a cluster quasi-randomized design, adult hypertensive patients from nine general practices within the same health facility were allocated to an intervention (IC; n=5) or a usual care cluster (UC; n=4). Intervention practices received information and guidance on SPC therapy. Outcomes included SPC uptake, changes in mean systolic and diastolic BP (SBP and DBP, respectively), target BP achievement and incident cardiovascular events. Analyses used intention-to-treat adjusted

regression and Cox models, with an as-treated analysis among patients initiated on SPC therapy.

Results: We included 438 patients (mean age 64.5±12.2 years) with a median follow-up of 367 days [interquartile range 213-467]. SPC therapy was more often initiated in the IC (n=50/199; 25.1%) than in the UC (n=24/239; 9.6%, p<0.001). In the IC, average SBP and DBP reductions were -15.7 mmHg (95%CI -18.4; -13.0) and -6.9 mmHg (95%CI -8.4; -5.3), respectively. In the UC, corresponding reductions were -10.4 mmHg (95%CI -12.9; -7.8) and -4.6 mmHg (95%CI -6.1-; 3.2). Compared to UC, SBP and DBP decreased significantly more in the IC (delta -5.3 mmHg (95%CI -9.0-; -1.6) and delta -2.3 mmHg (95%CI -4.4-; -0.2), respectively). Patients in the IC achieved more often their target BP: OR 1.4 (95%CI 1.0; 2.1). In the as-treated analysis among SPC patients, SBP and DBP decreased by 22.4 mmHg (95%CI -27.8; -17.1) and 10.5 mmHg (95%CI -13.5; -7.5), respectively. Cardiovascular events occurred in six patients during follow-up, with no association with cluster allocation or SPC initiation.

Discussion: The SOLO project was associated with a higher uptake of SPC therapy and improved blood pressure control.

Conclusion: These findings support that local SPC implementation projects could lead to more effective hypertension management in primary care.

ID 972- Hypertension awareness, treatment, and control in people with diabetes: Results from the global May Measurement Month campaigns 2017-2022

Miriam PIKKEMAAT [1] , Peter NILSSON [2], Thomas BEANEY [3], Neil POULTER [3], Katie HARRIS [4], Aletta SCHUTTE [4]

(1) Center For Primary Healthcare Research, Department Of Clinical Sciences, Lund University, Malmö, Suède
(2) Department Of Clinical Sciences, Lund University, Skåne University Hospital, Malmö, Suède
(3) Imperial College London, London, Royaume-Uni
(4) The George Institute For Global Health, University Of New South Wales, Sydney, Australie

Context: Hypertension is the leading modifiable risk factor for cardiovascular disease worldwide and highly prevalent among people with diabetes. Effective detection and control of raised blood pressure (BP) are essential components of diabetes care. Despite this, global data on hypertension awareness, treatment and control in people with diabetes remain limited, and international patterns relevant for primary care equity are poorly described.

Objectives: To compare hypertension prevalence, awareness, treatment and control between people with and without diabetes screened in the May Measurement Month (MMM) campaigns, and to assess whether these associations differ by age, sex and world region.

Methods: We analysed harmonised data from five MMM campaigns (2017–2022). Adults ≥18 years with two valid BP readings and information on diabetes status were included. Hypertension was defined as BP ≥140/90 mmHg or current antihypertensive treatment. Logistic regression was used to estimate odds ratios (ORs) for diabetes vs no diabetes, stratified by sex and age.To assess regional variation, we estimated diabetes–hypertension associations separately for each region.

Results: Of 3.8 million participants, 302,060 (7.9%) reported diabetes. Across all sex–age strata, individuals with diabetes had higher odds of hypertension (overall OR 4.0), and higher awareness (OR 4.5), treatment (OR 4.3) and overall BP control (OR 2.1) than those without diabetes. Associations were strongest in younger adults and attenuated with age. Control among treated individuals differed only modestly between groups (57% diabetes vs 56% non-diabetes). Strong regional variation was observed: East and South Asia showed the strongest associations between diabetes and higher awareness, treatment and overall BP control, while

these associations were weaker in Europe and the Americas.

Discussion: People with diabetes are more often detected and treated for hypertension, likely due to more frequent primary care contact, yet BP control remains suboptimal. The gap between treatment and control highlights missed opportunities for treatment intensification, adherence support and integrated care.

Conclusion: Globally, individuals with diabetes are more likely to be aware of and treated for hypertension but still fail to achieve adequate BP control. Strengthening primary care systems by integrating hypertension and diabetes management, improving adherence support and adapting regional BP targets may reduce inequities and improve cardiovascular outcomes.

ID 754- Optimized hypertension care for people with high blood pressure by improved integrated care and self-management tools: a mixed-methods study

Rimke VOS [(1)], Saskia VAN GRONDELLE [(1)] , Annefrans VAN EDE [(1)], Jonne TER BRAAKE [(1)], Sytske VAN BRUGGEN [(1)], Guy RUTTEN [(2)], Michiel BOTS [(2)], Hedwig VOS [(1)], Mattijs NUMANS [(1)]

(1) Department Of Public Health And Primary Care, Leiden University, The Hague, Pays-Bas
(2) Julius Center For Health Sciences And Primary Care, University Medical Center, Utrecht, Pays-Bas

Context: High blood pressure (BP) is an often treatable cause of cardiovascular disease. We developed an intervention, featuring a cardiovascular expert team and a toolbox, to support healthcare professionals (HCPs) in hypertension management and enhance patient self-management.

Objectives: This study evaluates the adoption and feasibility of this intervention.

Methods: A mixed-methods study in general practices in the Netherlands. HCPs could consult a cardiovascular expert team and use a self-management toolbox for their patients as preferred. We interviewed HCPs guided by the Consolidated Framework of Implementation Research (CFIR), and HCPs completed the Determinants of Implementation Behaviour Questionnaire (DIBQ). Using CFIR-ERIC matching tool, we matched implementation strategies to identified barriers. Adults with elevated BP, who were prescribed at least two blood pressure lowering medications were eligible to participate. Patient and disease characteristics were extracted from the electronical medical record.

Results: Of 591 eligible patients at thirteen general practices, 176 participated. The cardiovascular expert team was well-received, with 33 unique consultations, although nurse practitioners (NPs) might need the expertise of the expert team more frequently than general practitioners (GP) (adoption). The toolbox was perceived as challenging to use (feasibility). We subsequently identified three key strategies to improve implementation. Mean systolic and diastolic BP were 158/87 mmHg at baseline and 148/85 mmHg after 12 months, although this change cannot be conclusively linked to the intervention.

Discussion: Overall, the study emphasized the importance of structured implementation strategies to optimize hypertension care interventions. Primary and secondary care working together in the form of a cardiovascular expert team, teleconsultation and self-management tools are valuable ways to improve hypertension management. To ensure adoption and feasibility, future implementation efforts should focus on engaging NP's as key users of the cardiovascular expert team and applying strategies such as formal implementation plan and the identification of champions.

Conclusion: Structured implementation strategies may be helpful in hypertension management. The cardiovascular expert team was considered valuable, but might be better targeted to NPs rather than GPs.

ID 659- Perception of working conditions and ambulatory blood pressure profiles in

workers with high office blood pressure in primary care: an ancillary study of the French MAPAGE project.

Claire ZABAWA [(1)] , Katia MAZALOVIC [(1)], Fiona CHANUT [(1)], Julien MORISSON [(1)], Michael TAROUX [(1)], Yannick BÉJOT [(2)], Catherine QUANTIN [(2)]

(1) Département De Médecine Générale, Dijon, France
(2) Centre Hospitalier Universitaire, Dijon, France

Context: Ambulatory blood pressure (BP) measurements are recommended for the diagnosis and follow-up of hypertensive patients. Twenty-four-hour ambulatory blood pressure monitoring (ABPM) is the most cost-effective strategy. It provides accurate BP measurements and variations over the nycthemeral cycle. Several BP profiles have been described: white-coat, daytime, 24-hour and nocturnal hypertension. Adverse work conditions have been associated with an increased risk of hypertension. Few data are available on work conditions and BP profiles.

Objectives: We aimed to analyze the characteristics and circadian BP profiles of French primary care patients with elevated office BP, according to their perception of work conditions.

Methods: This observational, cross-sectional, multicenter study prospectively enrolled the patients of 23 general practitioners in XXX region, France. We included the first patient of the day with office BP ≥ 140/90 mm Hg, whatever the reason for consultation and treatment. All included patients underwent ABPM. Hypertension profiles were defined according to current guidelines. Medical, sociodemographic and deprivation data were collected. Active patients were analyzed and work conditions were assessed thanks to a declarative self-questionnaire. Patients with easy and demanding work conditions were compared. The determinants of demanding work conditions were identified using logistic regression models in men and women.

Results: From July 2015 to August 2020, 627 patients were included with 178 workers. Work conditions were described as rather demanding/demanding for 55 (61.1%) men and 49 (55.7%) women. In multivariate analyses, demanding work conditions were associated with nighttime systolic hypertension (OR=3.15; 95%CI 1.043-9.50) and low/moderate cardiovascular score risk (OR=0.19; 95%CI 0.06-0.65) among men. Among women, young age (OR=0.91; 95%CI 0.86-0.97) and isolated nocturnal hypertension (OR=5.48; 95%CI 1.24-24.2) were associated with demanding work conditions.

Discussion: This 5-year multicenter study provides original and relevant data for daily practice. The declarative endpoint is subjective but pragmatic. Questioning patients about their work conditions, through a simple way, is relevant for a global and comprehensive approach. ABPM seems preferable to self-measurement among patients reporting demanding work conditions to determine nighttime BP and assess cardiovascular risk.

Conclusion: Patients with demanding work conditions may have specific BP profiles with a higher cardiovascular risk. Effective cardiovascular primary prevention strategies may target this population.

Breast cancer

ID 2298- Psychosocial and cultural impact of breast cancer diagnosis among Omani women: a qualitative exploration of lived experiences

Kouthar SULAIMAN AL-ALAWI [(1)] , Harib Al Sumri HANA [(1)], Fai Chan MOON [(1)], Al Kayoumi ZAYANA TALIB [(2)], Sulaiman Al Fahdi2 AMAL [(3)], Al Azri MOHAMMED HILAL [(1)]

(1) Department Of Family Medicine And Public Health, College Of Medicine And Health Sciences, Sultan Qaboos University,, Muscat, Oman
(2) Department Of Holistic Care, Psychosocial Unit, Sultan Qaboos Comprehensive Cancer Care And Research Center, Muscat, Oman, Muscat, Oman
(3) Department Of Holistic Care, Psychosocial Unit, Sultan Qaboos Comprehensive Cancer Care And Research Center, Muscat, Oman

Context: Breast cancer represents the most prevalent malignancy among women in Oman, imposing considerable psychosocial and cultural burdens on both patients and their families. Understanding the lived experiences of affected

women is essential for designing culturally appropriate psycho-oncological care.

Methods: This qualitative study aimed to investigate the psychosocial and cultural dimensions of breast cancer among Omani mothers, concentrating on emotional trajectories, treatment decision-making, illness disclosure, and coping mechanisms within the family and community context.

Originality: Semi-structured, in-depth interviews were conducted with 18 Omani women diagnosed with stage I–III breast cancer who were receiving care at the Sultan Qaboos Comprehensive Cancer Care and Research Centre in Muscat. The interviews were audio recorded.

Lessons learned and future implication: Six main themes emerged: (1) the diagnostic journey and pathways to care; (2) emotional responses to diagnosis and shifting adaptation over time; (3) treatment experiences and decision-making influenced by trust, family authority, and cultural expectation.

Discussion: The findings highlight how women's experiences are profoundly shaped by familial roles, social stigma, and religious interpretations of illness. Culturally ingrained patterns of disclosure and reliance on familial support significantly influence women's adjustment and engagement with healthcare.

Conclusion: The integration of psychosocial support and culturally sensitive communication practices into cancer care is crucial for enhancing patient well-being and strengthening family involvement in treatment and recovery. Keywords: breast cancer, phenomenology, culture, disclosure, coping mechanisms.

(6) Umrestte Université Claude Bernard Lyon 1, Lyon, France

Context: The FASTRACS intervention supports women with breast cancer in preparing for their return to work (RTW), using tools designed for the patient, the general practitioner, the occupational physician and the company representative, in order to promote long-term job retention. Due to the diversity of its components, stakeholders and implementation contexts, FASTRACS is a complex intervention.

Objectives: The RECOVA-FASTRACS study aims to conduct a realistic evaluation of the programme in order to understand how, for whom and under what conditions it works.

Methods: RECOVA-FASTRACS is an ancillary study to the FASTRACS-RCT using convergent mixed methods, based on a multiple case study approach. The process follows four stages:(1) reconstruction of the initial theory; (2) collection of qualitative and quantitative data; (3) analysis according to the ICAMO framework (Intervention, Context, Actors, Mechanisms, Outcome) framework); (4) refinement of the theory through triangulation. Data collection includes: interviews with women in the intervention arm and their "trajectory" actors (doctors, referrers, relatives); focus groups with the professionals involved; and analysis of the RCT questionnaires.

Results: The initial theory identified the expected causal chains for the 45 performance objectives.Sixty-four interviews were conducted. Initial results show that the patient guide helped to anticipate recovery and structure the RAT process by encouraging the expression of needs and the mobilisation of the actors concerned. Analysis of user profiles suggests different levels of uptake: human resources professionals made particularly good use of it, while healthcare professionals and people who described themselves as independent used it less.

Discussion: This return-to-work intervention involving the pivotal role of the general practitioner appears to be effective. This work opens up the prospect of research into the city-hospital link and the issue of job retention in chronic diseases.

Conclusion: FASTRACS appears to be a tool that promotes positive thinking and behaviour for a suitable return to work.

ID 1956- Should we accept the new USPSTF guidelines to lower mammography age from 50 to 40? XXX cost-effectiveness analysis

Tom AXELROD [(1)] , Dahlia LESHNO [(2)]

(1) Clalit Healthcare Services And The Hebrew University, Jerusalem, Israël
(2) Maccabi Healthcare Services, Tel Aviv, Israël

Context: In 2024, the USPSTF revised mammography screening recommendations, lowering the starting age from 50 to 40 years. This change was based on modeling studies rather than new clinical trials, prompted by higher breast cancer mortality among Black women in the US and a 2% increase in breast cancer incidence in women aged 40-49 during 2015-2019. XXX and many European countries have different genetic diversity profiles and haven't shown similar increases in this age group. In addition, they did not include a cost-effectiveness analysis.

Objectives: To evaluate the clinical and economic impact of adopting the revised 2024 USPSTF mammography screening guidelines in XXX by: 1. Comparing breast cancer cases, deaths, and quality-adjusted life years (QALYs) between two strategies - starting screening at age 40 versus 50. 2. Estimating the associated costs and cost-effectiveness of each strategy in the XXX healthcare context. 3. Assessing whether lowering the screening age provides sufficient benefit to justify the economic burden, to help decision makers.

Methods: We constructed a decision analytic model comparing breast cancer screening for women aged 50-74 years versus 40-74 years, reflecting XXX epidemiology, life expectancy, and costs across four major subpopulations. We estimated breast cancer cases, deaths, costs, and resource demands.

Results: Starting screening at age 40 compared to age 50 averted 1.3 breast cancer deaths per 1000 women screened. The QALY gain was 0.037 with an additional cost of 21,000 XXX, resulting in an ICER of 567,567 XXX/QALY—significantly higher than XXX's willingness-to-pay threshold of 139,000 XXX (=GDP per capita).

Discussion: Our analysis suggests that adopting the new USPSTF guidelines in XXX would not be cost-effective. The small clinical benefit does not justify the substantial economic burden on the healthcare system. XXX's unique population demographics and breast cancer epidemiology differ from the US, warranting country-specific screening policies rather than automatic adoption of international guidelines.

Conclusion: We recommend maintaining the current practice of initiating routine mammography screening at age 50 for the general XXX population.

ID 1786- Modifiable risk factors for breast cancer. An umbrella review

Xavier GOCKO, Amélie SAYVE, Catherine PLOTTON

Dmg Saint-Etienne, Saint-Etienne, France

Context: In 2022, breast cancer remained the leading cancer among women in terms of both incidence and mortality. In France, the 2015 citizen consultation revealed a strong demand from women for better information on primary prevention.

Objectives: This study aimed to synthesize current evidence on breast cancer risk factors, to inform both women and healthcare professionals involved in prevention.

Methods: An umbrella review was conducted following the Joanna Briggs Institute (JBI)

methodology, including systematic reviews and meta-analyses published between 2015 and 2025, in french or english. Data were extracted and assessed independently by two reviewers, and the methodological quality of the reviews was appraised using the AMSTAR 2 tool.

Results: Of the 364 records identified, 10 reviews were included, 7 of which were of moderate to high quality. Western diets high in red meat and processed foods, along with alcohol consumption, were associated with an increased risk of breast cancer. A diversified diet rich in fruits, vegetables, and whole grains appeared protective. Postmenopausal overweight increased risk, while physical activity reduced it. Combined estrogen-progestin or progestin-only contraceptives were not clearly linked to breast cancer risk, unlike estrogen-only therapies and hormone replacement therapy. Nulliparity and late first pregnancy increased the risk, whereas breastfeeding was protective.

Discussion: Dietary habits, sedentary lifestyle, alcohol intake, nulliparity, and age at first pregnancy were identified as "discussed" risk factors by the French National Authority for Health (HAS). Smoking was not considered a breast cancer risk factor by the HAS due to a relative risk below 1.1.

Conclusion: This work could be complemented by a broader umbrella review exploring the role of the exposome, particularly environmental exposures.

Corresponding author: Catherine Plotton, catherine.plotton@univ-st-etienne.fr

ID 908- Understanding diagnostic delays in breast cancer: two reviews based on high-income and African countries

Kristel VAN ASSELT [(1)] , Liza HOVELING [(2)], Trachita HARFST [(3)], Lynn HEUKEN [(3)], Melinda SCHUURMAN [(2)], Sabine SIESLING [(2)], Christina BODE [(3)]

(1) Julius Center Umcu, Utrecht, Pays-Bas
(2) Iknl, Utrecht, Pays-Bas
(3) Ut Twente, Enschede, Pays-Bas

Context: Timely breast cancer (BC) diagnosis is crucial for improved outcomes, yet delays remain prevalent worldwide. In high-income countries, diagnostic delays arise from multiple systemic factors, while in Africa, mortality rates are highest due to prolonged diagnostics .

Objectives: This abstract describes 2 scoping reviews on diagnostic delays in BC among women, comparing contributing factors across different healthcare and sociocultural settings.

Methods: Following PRISMA-ScR guidelines, we conducted 2 global scoping reviews of diagnostic delays in BC (qualitative and quantitative studies) published between 2018 and 2023. Searches were performed in PubMed/MEDLINE and Scopus. Studies focused solely on screening, non-English and those not meeting inclusion criteria were excluded. Two reviewers independently screened and extracted data. Bronfenbrenner's ecological model was applied to classify factors at the micro, meso, exo, and macrosystem levels.

Results: Of the 9699 retrieved records, 128 studies met inclusion criteria, with 22 focusing on high-income countries and 30 on African countries. In high-income settings, diagnostic delays were linked to microsystem (health behaviors, psychological factors, provider interactions), mesosystem (peer networks, scheduling), exosystem (social and environmental barriers), and macrosystem (policy and cultural influences) factors. In Africa, delays were largely attributed to low awareness, cultural beliefs, financial barriers, reliance on traditional healers, and healthcare inefficiencies.

Discussion: Although diagnostic delay is a global issue, the underlying mechanisms differ substantially by context. High-income settings are characterized by complex interactions between individual help-seeking behavior and health system organization. In contrast, structural and sociocultural barriers play a dominant role in African settings. These findings suggest that effective interventions must align with contextual realities: strengthening navigation and communication pathways in high-income countries, and improving community-level awareness, affordability, and system capacity in African countries.

Conclusion: Diagnostic delays in BC are multifaceted with distinct patterns across settings. Context-specific, multi-level interventions, improving access, addressing cultural beliefs, and enhancing system responsiveness are essential to support timely diagnosis. Future research should

prioritize tailored strategies that reflect the ecological environments in which women seek care.

ID 53- Performance Metrics of Mammography Screening Programmes in Primary Health Care Centres

Ghufran JASSIM

Royal College Of Surgeons In Ireland Medical University Of Bahrain, Muharraq, Bahreïn

Context: Mammography is the cornerstone of breast cancer screening. Its diagnostic performance, however, is influenced by population demographics such as age and breast density.

Objectives: The purpose of this study was to establish contemporary performance benchmarks for mammography in the PHC system and to assess screening performance trends over time. Estimates were based on standardized reporting and longitudinal verification, offering a more robust benchmark for future quality-improvement efforts.

Methods: A cross-sectional retrospective analysis was performed on mammograms from asymptomatic women aged ≥40 years who were screened in 2020 at the primary health care centres. Screening outcomes were cross-referenced with subsequent breast cancer diagnoses recorded in the Cancer Registry. The performance metrics including the cancer detection rate (CDR), sensitivity, and specificity were calculated.

Results: A total of 2,196 screening mammograms were included, with a mean patient age of 56.1 years. The cancer detection rate was 12.3 per 1,000 screens, and the recall rate was 30.6%. Sensitivity and specificity were 69.2% and 71.2%, respectively, and the interval cancer rate was 5.4 per 1,000. The most common breast density category was “scattered fibroglandular” (61.8%). Recall rates were significantly associated with breast density ($p < 0.001$). Among the 39 patients diagnosed with breast cancer, invasive ductal carcinoma was the most prevalent subtype (71.8%).

Discussion: Our findings are generally consistent with the range of results reported in the literature, though certain metrics differ in magnitude.One of the limitations is the screening population’s relatively younger age and greater breast density likely reduced the observed sensitivity and specificity of mammography, potentially underestimating the true cancer detection rate.

Conclusion: The findings highlight the moderate utility of mammography screening in Primary Health Care Centers, characterised by a relatively high recall rate and a need to optimise reporting standards and recall criteria. Tailored strategies such as supplemental imaging for women with dense or high-risk breasts, strict adherence to BI-RADS guidelines, and implementing double reading or single reading with computer-aided detection could improve screening outcomes. These results establish important regional performance benchmarks. Empowering women to make informed choices about screening (reflecting the principle of liberty) can together enhance participation, trust, and effectiveness of national screening programs.

Bridging the gap: patients and GPs connected

ID 1890- How Social Deprivation Influences Primary Care Contacts: A Population-Based Analysis of Healthcare Utilization by Deprivation Levels in France

Yohann VERGÈS [(1)] , Aurore PALMARO [(1)], Julie DUPOUY [(1)], Catherine LAPORTE [(2)]

(1) Dumg Toulouse, Toulouse, France
(2) Dmg Clermont-Ferrand, Clermont-Ferrand, France

Context: Access to primary care is key to equitable healthcare systems. In France, social inequalities shape healthcare access. While the "ecology of care" model describes contact distribution across care levels, few population-level studies have systematically examined how social deprivation affects primary care utilization. This study aimed to provide a population-based assessment of primary

care utilization patterns in France, stratified by social deprivation levels (FDep).

Objectives: - Quantify contacts with medical and paramedical primary health care professionals across deprivation quintiles. - Provide a descriptive analysis of how social deprivation influences access to primary care services.

Methods: We conducted a nationwide, population-based, cross-sectional study using 2018, 2020 and 2022 data from the French National Health Data System (SNDS), covering 99% of the population. Healthcare utilization was measured as the number of beneficiaries per 1,000 individuals with at least one reimbursement ("contact") in a given month. Social deprivation was assessed using the FDep index, categorizing the population into quintiles. We analyzed contacts with GPs, other medical specialists, nurses, midwives, physiotherapists, and other paramedical professionals. Descriptive statistics were used to compare utilization rates across deprivation levels.

Results: While final results are still being processed, preliminary findings suggest significant variations in primary care utilization based on social deprivation. Higher deprivation levels (FDep quintiles 4–5) would be associated with increased contact with GPs and nurses and with descreased contact with other medical specialists and with other paramedical services (e.g., physiotherapists, psychologists).

Discussion: This study will provide a descriptive overview of primary care utilization in France, highlighting potential differences in contact patterns based on social deprivation. Higher deprivation could correlate with more GP/nurse contacts, possibly reflecting greater needs and greater barriers to specialized care and other paramedical use. These findings would align with existing literature on healthcare disparities but extend the analysis to a population-wide scale.

Conclusion: Deprivation influences primary care use. This population-based study will offer a detailed snapshot of primary care utilization in France, stratified by social deprivation, and so contribute to a better understanding of healthcare access disparities. Future work will focus on longitudinal analyses to assess trends over time and evaluate policy impacts on reducing inequalities in primary care.

ID 2031- Understanding primary care access and challenges for historically, persistently or systematically marginalized patients: a qualitative study

Abraham MUNENE [(1)], Emily MARSHALL [(1)] , Aishwarya RADHAKRISHNAN [(1)], Heather HAYMAN [(2)], Kevin POTTIE [(1)], Lisa BARRETT [(1)], Katie HECKMAN [(3)], Kolten MACDONNELL [(3)], Eunice ABAGA [(1)]

(1) Dalhousie University, Halifax, Canada
(2) North End Community Health Centre, Halifax, Canada
(3) Nova Scotia Health Authority, Halifax, Canada

Context: Historically, Persistently or Systematically Marginalized (HPSM) communities are economically and/or socially excluded from the society in which they live by socio-economic status, gender, class, race, ethnicity, age, sexuality or “other” group identity. This study sought to learn from HPSM community members to understand their lived experiences regarding their health, their access to primary care services, and the challenges they face in gaining attachment to PCPs (primary care providers).

Objectives: To understand the experiences of HPSM patients’ regarding their health needs, interactions with PCPs, and access to primary care and related services. Additionally, we interviewed PCPs to understand their experiences serving HPSM patients including the healthcare needs of their patients, barriers and challenges they face when supporting the health needs of patients, their patients’ access to primary care, and supports needed to better serve patients.

Methods: We conducted a qualitative study in XXX, with patients belonging to HPSM communities and the PCPs serving the communities. A purposive sampling technique was used to recruit participants. Participants were recruited through local community-based organizations (i.e., Homeless shelters, YMCA’s, Libraries, Café’s, Community clinics, Immigration and Educational organizations)

and street walks by two research team members.Interviews were conducted between July and December 2025. Data will be analysed using a thematic analysis.

Results: Recruitment is ongoing. We have interviewed 20 patients, (13 male), and 6 primary care providers (4 female). Early findings suggest that wait times to receive care, issues with system navigation for patients, primary care provider and allied health staff shortages, a lack of social and living supports, and systemic issues with implicit biases, are challenges to accessing care for patients.

Discussion: This study will help to identify the needs of HPSM patients, who have historically had poorer access to healthcare, and provide new information about the primary care challenges they experience. Furthermore, by considering both patient and provider experiences and perspectives, we can identify gaps and ways to improve care for HPSM patients.

Conclusion: The findings from this study will be used to inform policy, practices, planning, and the provision of primary care services in XXX for HPSM patients.

Corresponding author: Emily Marshall, emily.marshall@dal.ca

ID 1556- Uptake of patient enrolment in primary care and associated factors: a systematic review and meta-analysis

Jialing LIN [1] , Bates SHONA [1], Allen LUKE [2], Wright MICHAEL [1], Mao LIMIN [1], Chomik RAFAL [1], Dietz CHRIS [1], Kidd MICHAEL [1]

(1) University Of New South Wales, Randwick, Australie
(2) University Of Oxford, Oxford, Royaume-Uni

Context: Patient enrolment in primary care refers to the formal process of registering patients with a specific primary care provider, team, or practice. This approach is often expected to enhance continuity and coordination of care. However, limited information exists on the uptake of patient enrolment and its associated characteristics.

Objectives: This review aimed to estimate the uptake of patient enrolment in primary care and examine factors associated with decisions around enrolment.

Methods: Eight electronic databases (PubMed, Cochrane Register of Systematic Reviews, Embase, CINAHL, PsycINFO, PAIS, Web of Science, and Scopus) were searched for peer-reviewed articles published from January 2014 to July 2024. Findings from included studies were extracted and synthesised, with uptake estimated through meta-analysis and factors associated with enrolment summarised narratively. Review registration: PROSPERO CRD42024597078.

Results: Ten studies across nine publications were included. Of these, eight studies with 27,919,216 participants were included in the meta-analysis. The results showed a pooled patient enrolment uptake rate of 71.4% (95% Confidence Interval [CI]: 13.6-97.5%). There was no significant difference in enrolment rates between population-wide and program-based enrolment (72.4% vs. 73.5%; p=0.980). Several associated factors were identified in three publications. Women showed higher enrolment rates than men (adjusted odds ratio [aOR]=1.07, 95% CI: 1.07-1.08), while recently arrived immigrants in a country had lower enrolment rates than the established population (aOR=0.40, 95% CI: 0.40-0.41). Patients living in small urban/suburban/rural areas had higher enrolment rates than those in large urban/metropolitan regions (aORs: 1.17-2.18). Higher socioeconomic level was associated with increased rates of enrolment. Patients with some specific chronic health conditions, such as those with diagnosed mental illness or substance use disorders, had lower enrolment rates.

Discussion: The findings reveal that more than two-thirds of patients were enrolled with a primary care provider or practice; enrolment was influenced by demographic, geographic, socioeconomic, and clinical factors. Lower enrolment among men, recent immigrants, individuals living in large urban/metropolitan areas, lower socioeconomic groups, and those with certain health conditions may indicate potential barriers to health service access and opportunities for enrolment.

Conclusion: Addressing these disparities is essential to promote equitable access and enhance opportunities for continuity and coordination of primary care.

Corresponding author: Jialing Lin, jialing.lin@unsw.edu.au

ID 1320- Accessibility of Primary Care for People With Disabilities: A Mixed-Methods Evaluation Within the Saintonge Romane Territorial Health Community (CPTS)

Clara BLANCHARD, Margaux FLEURY, Alix MADELAINE

Mspu Coeur De Saintonge, Pont L Abbe D Arnoult, France

Context: Ensuring equitable access to care for people with disabilities is a national priority in France, reinforced by the 2005 law mandating accessibility for all public facilities. In a context marked by demographic growth, population ageing and an increasing number of people living with disabilities, the Territorial Professional Health Communities (CPTS), created in 2016, aim to improve access to care across communities. Within the CPTS of Saintonge Romane, accessibility of general practices and pharmacies remains crucial to support autonomy and reduce disparities. This study explored how healthcare professionals address accessibility and how collaborative practices contribute to improving patient pathways.

Objectives: To assess the current state of accessibility in general practices and pharmacies for people with disabilities within the Saintonge Romane CPTS, using a combined quantitative and qualitative approach.

Methods: A mixed-methods approach was used. – Quantitative study: a cross-sectional voluntary survey was distributed to 68 general practitioners and 18 pharmacists (July–October 2025). – Qualitative study: semi-structured interviews with 8 GPs and 4 pharmacists were analysed using a grounded-theory-inspired method.

Results: Participation reached 76%. Accessibility for motor disabilities was generally satisfactory, with over half of GPs offering multiple appointment modes. However, adaptations for cognitive, mental or neurodevelopmental disabilities remained limited. Fewer than one quarter of GPs and one third of pharmacists used more than one communication aid. Interviews highlighted persistent barriers: cost, limited knowledge of regulations, lack of adapted equipment and structural constraints. Despite this, practitioners described concrete solutions across the care pathway: flexible appointment options, extended consultation time, quieter time slots, home visits, pharmacy delivery systems and spatial adaptations. The involvement of staff and caregivers, and a trusting practitioner–patient relationship, were identified as essential facilitators.

Discussion: Combined findings show that professionals actively implement solutions to enhance accessibility, yet significant gaps remain—especially regarding communication and support for cognitive or mental disabilities. Strengthening collaborative practices may help reduce these inequities.

Conclusion: Accessibility within the CPTS shows encouraging initiatives but persistent challenges. Targeted improvements, particularly in communication and disability-specific adaptations, are needed to ensure equitable access and support autonomy for all patients.

Corresponding author: Margaux Fleury, mgx.flr@gmail.com

ID 1077- Socio-demographic factors associated with the mobility of patients consulting in municipal health centers in the city of Saint-Denis (Paris suburb).

Sarah ROBERT, Hugo FIGONI, Marguerite SALABELLE

Sorbonne University, Paris, France

Context: General Practice (GP) is the entry point to the healthcare system. In the city of XXX (Paris area), this access is notably provided by four Municipal Health Centers (CMS). These centers fight against territorial health inequalities in a context of scarce medical provision, while the city's economically disadvantaged population has significant health needs. Studying the factors favoring or limiting the health-related mobility of patients consulting in GP in these centers would allow identifying levers to facilitate access.

Objectives: To investigate the socio-demographic factors associated with the mobility of patients consulting in GP at the XXX CMS.

Methods: A retrospective observational cross-sectional study was conducted using administrative data extracted from the practice management software. The walking distance between the patients' homes and the reference CMS was used as the primary outcome. Associations between socio-demographic data and this distance were calculated using a multilevel mixed model to account for a possible ecological effect of the patients' social environment using the Fdep social deprivation index.

Results: 13,072 patients from 43,116 GP consultations were analyzed. After adjustment, adulthood (age between 26 and 60), male gender, and means-tested health insurance were associated with a greater walking distance. CMS located at crossroads of human mobility and transport routes were associated with a greater distance traveled compared to isolated ones.

Discussion: Several confounding factors, particularly related to health status, which could explain reduced mobility, could not be taken into consideration as this study is limited to administrative data. This study allows outlining several profiles of patients consulting in the XXX CMS according to their mobility.

Conclusion: Examining mobility associated with GP care allows characterizing the territorial footprint of healthcare sites and the spatial practices of their users. Identifying the least mobile individuals, who are possibly excluded from care, allows implementing measures to maintain this link as well as outreach actions.

Corresponding author: Sarah Robert, sarah.robert@sorbonne-universite.fr

ID 884- Targeted Phone Outreach to Improve Colorectal Cancer Screening: A Primary-Care Strategy to Address Territorial Inequalities

Paul AUJOULAT, Gaelle RAGOT, Yasmine ZAOUCHE

Ubo, Brest, France

Context: Colorectal cancer (CRC) screening remains suboptimal in Europe, with marked social and territorial disparities. Proactive outreach strategies, particularly in underserved areas, could help reduce these inequalities. The Marsatak project evaluates whether medical students' phone calls to patients identified as non-up-to-date through health insurance lists can improve CRC screening uptake.

Objectives: To assess whether proactive phone calls made by general practice residents to patients identified as non–up-to-date with colorectal cancer screening can improve screening uptake and help reduce territorial disparities in participation.

Methods: This prospective interventional study involved 26 general practice residents across multiple primary care centres. Each resident received a list of their supervising physician's patients who were not up-to-date with CRC screening according to health insurance data. Residents conducted structured phone calls providing information, addressing barriers, and encouraging test completion. All contacts were logged using a standardised data-collection sheet including sociodemographic variables, number of calls required, screening eligibility, patient attitudes, and acceptance or refusal of the FIT test

Results: A total of 13,436 patients were contacted. Among them, 7,052 (52.5%) answered the call. Of respondents, 3,543 (50.2%) expressed willingness to complete the FIT after receiving explanations; 1,403 (19.9%) were not eligible (already screened or exempt from screening); 1,545 (21.9%) refused despite discussion; and 798 (11.3%) remained ambivalent. Preliminary analyses show feasibility of the intervention across diverse settings and highlight strong patient receptivity when the call originates from their local care team. Qualitative feedback suggests patients perceived the approach as supportive and valued being personally contacted about prevention.

Discussion: Phone outreach by local healthcare professionals appears to be an effective lever to enhance CRC screening participation, particularly in regions with historically low uptake. Using insurance-generated lists enables targeted action toward populations most at risk of non-

participation. Future analyses will determine actual test completion rates at 2 and 6 months and explore factors associated with acceptance, ambivalence, and refusal.

Conclusion: The Marsatak intervention demonstrates that personalised phone calls based on up-to-date registries can strengthen CRC screening outreach and may help reduce territorial inequalities in preventive care participation.

ID 751- Strengthening Continuity, Equity and Community-Oriented Primary Care through Re-Engaging Inactive Patients in Rural General Practice

Natalie DALY [(1)] , Carl DEANEY [(2)], Michelle DAFF [(3)], Sophie KIRK [(1)], Sarah KNUDSEN [(3)]

(1) Gpa, Louth, Royaume-Uni
(2) Gp, Louth, Royaume-Uni
(3) Hca, Louth, Royaume-Uni

Context: Ensuring equitable access, continuity of care and community-oriented primary care are central to the WONCA Europe framework. In rural settings, barriers such as transport limitations, socioeconomic constraints, digital exclusion and lower health literacy can widen inequalities reducing patient engagement. Inactive or infrequently attending patients are at heightened risk of unmet preventive needs, unmanaged long-term conditions and delayed diagnosis.

Objectives: To develop and evaluate a structured re-engagement programme designed to identify, stratify and reconnect patients who had not contacted the practice for ≥12 months, to determine its impact on access, continuity, equity, and preventive health activity within a rural general-practice population.

Methods: A mixed-methods retrospective evaluation was undertaken using clinical-system searches to identify 1,049 patients with no recorded engagement in the previous year. Patients were stratified by age, comorbidities and cardiovascular-metabolic risk. A multimodal personalised strategy was deployed, SMS invitations, letters and structured telephone calls supported by care navigation, shared-decision making and flexible appointment options. Quantitative outcomes included re-attendance, uptake of NHS Health Checks, blood pressure reviews, lipid testing and population-screening participation.

Results: Inactive patients covered all age groups (0–4 years: 32; 5–11: 145; 12–18: 156; 19–39: 358; 40–74: 349; ≥75: 9). The 40–74-year group showed the greatest unmet clinical need, with many overdue NHS Health Checks and presenting unaddressed hypertension, hypercholesterolaemia or missed screening. Early outcomes indicate that personalised communication and increased appointment flexibility improved re-attendance and enabled more timely cardiovascular-risk identification. Qualitative findings highlighted trust, relational continuity and clear communication as key enablers of re-engagement.

Discussion: As a retrospective service evaluation, findings reflect early outcomes rather than long-term clinical impact, causal inferences cannot be definitively drawn. Digital contact methods, while efficient, may still risk missing the most marginalised groups, and future iterations should consider community-based or partner-organisation outreach to enhance reach. Further evaluation to determine sustainability, cost-effectiveness, and the optimal balance between automated and relational components of the programme.

Conclusion: A structured, continuity-focused re-engagement programme can reduce inequities, strengthen community-oriented primary care and support proactive population health management in rural settings. Embedding systematic outreach within routine general-practice processes may provide a scalable model aligned with WONCA principles, improving outcomes for underserved and disengaged populations.

Cancer 2

ID 2002- What drives cancer screening uptake in primary care? Evidence from adults aged 50–65 years in Türkiye

Serdar OZTORA, Dilan CILAK, Hamdi Nezih DAGDEVIREN

Trakya University, Edirne, Türkiye

Context: Cancer screening is a key preventive strategy in primary care, enabling early detection and improved outcomes. In XXX, national cancer screening programs are provided free of charge; however, participation rates remain below recommended levels. Identifying determinants of screening uptake is essential to strengthen primary care–based prevention strategies.

Objectives: To assess the frequency of cancer screening uptake and to explore factors associated with participation in national cancer screening programs among adults aged 50–65 years in a primary care setting.

Methods: This descriptive cross-sectional study was conducted among adults aged 50–65 years registered with family health centers in the city center of XXX, XXX. A total of 401 participants were included. Data were collected through face-to-face interviews using a structured questionnaire assessing sociodemographic characteristics, cancer screening–related knowledge, attitudes, and behaviors. Descriptive statistics and comparative analyses were performed. Statistical significance was set at $p<0.05$.

Results: The mean age of participants was 56.45±4.59 years, and 49.1% were women. Overall, 44.1% of participants reported having undergone at least one cancer screening test. Screening uptake was significantly higher among individuals who had received a screening recommendation ($p<0.001$), particularly from family physicians. The most common reason for screening participation was physician recommendation (54.2%), whereas lack of knowledge (37.9%) and fear of receiving bad news (35.3%) were the main reasons for non-participation. Female sex, being married, engaging in regular or partial physical activity, abstaining from alcohol, and having a first-degree relative with cancer were significantly associated with screening uptake. Participants who had undergone screening demonstrated significantly higher knowledge and attitude scores compared to those who had not ($p<0.05$).

Discussion: The findings underline the pivotal role of family physicians in influencing cancer screening behaviors. Both informational gaps and emotional barriers continue to limit screening uptake, despite the availability of organized national programs.

Conclusion: Cancer screening participation among adults aged 50–65 years remains suboptimal. Strengthening proactive recommendations, patient-centered counseling, and continuity of care in primary care settings may substantially improve uptake of national cancer screening programs.

ID 1564- Barriers and Facilitators to Prostate Cancer Healthcare in Black Men in the UK: From Diagnosis to Survivorship

Dena ETTEHAD [(1)] , Julia V BAILEY [(1)], Kate WALTERS [(1)], Samuel Wd MERRIEL [(2)], William KINNAIRD [(3)], Greg SHAW [(3)], Mike KIRBY [(4)], Dipesh P GOPAL [(5)], Hilary BAKER [(3)], Patricia SCHARTAU [(3)]

(1) University College London, London, Royaume-Uni
(2) University Of Manchester, Manchester, Royaume-Uni
(3) University College London Hospital, London, Royaume-Uni
(4) British Society For Sexual Medicine, Staffordshire, Royaume-Uni
(5) Queen Mary University Of London, London, Royaume-Uni

Context: Prostate cancer (PCa) is the most common cancer among men in the UK, with a disproportionate impact on those from Black African and Caribbean backgrounds. Black men are twice as likely to develop PCa, experience more aggressive disease progression, and are 2.5 times more likely to die from it than their White counterparts. They are diagnosed at a younger age and present to their family doctor at later stages. Black men are more likely to be diagnosed with advanced disease, and the survival gap compared to White men continues to widen. Despite these challenges, Black men are less likely to receive treatments that are proven to be their best chance of cure and report poorer healthcare experiences compared to White men.

Objectives: Our study identified barriers and facilitators to PCa healthcare in UK Black men and

suggests ways to improve engagement and experiences across the healthcare pathway.

Methods: We conducted semi-structured interviews with: (i) 12 UK Black men living with and beyond PCa, (ii) 15 UK Black men aged 45 or above, (iii) 15 UK multi-disciplinary healthcare professionals (HCPs). Interview transcripts were coded and analysed thematically, using the socioecological model to map barriers and facilitators.

Results: We found that barriers to access and engagement with PCa care included mistrust of Western medicine, experiences of racism, fear and stigma around PCa, inadequate culturally sensitive information, underrepresentation of Black HCPs and Black men in healthcare spaces, limited culturally sensitive psychological support, and masculinity constructs affecting open discussions and preferences for minimally invasive treatments. Facilitators include racially concordant HCPs, culturally sensitive care, continuity of care, and support from partners, peers, and community groups.

Discussion: Internalised, interpersonal, and systemic racism undermine Black men's experiences and engagement with PCa care, contributing to delays in care-seeking, reduced treatment engagement, and poorer healthcare experiences. By mapping barriers and facilitators from the macro to the micro level, we highlight the need for multi-level interventions that address how these forms of racism intersect and compound challenges across the care pathway.

Conclusion: Providing culturally sensitive information, care from racially concordant HCPs, and community support can enhance Black men's survivorship experiences and engagement with healthcare.

ID 1182- Does an MRI-first approach improve adherence and diagnostic outcomes?

Maria Teresa SILVA [1] , Miguel VIEIRA [2]

(1) Faculty Of Medicine Of The Catholic University Of Portugal, Lisbon, Portugal
(2) Nova School Of Law Of University Nova Of Lisbon, Lisbon, Portugal

Context: Prostate cancer remains a prevalent malignancies among men worldwide, with 10–20% of cases in high-income countries and up to 60% in parts of Europe still diagnosed at advanced stages. Traditional early-detection pathways in primary care—principally prostate-specific antigen (PSA) testing, digital rectal examination (DRE), and transrectal ultrasound (TRUS)–guided biopsy—are limited by low specificity, patient discomfort, and high refusal rates for invasive steps. These challenges contribute to incomplete screening cascades and delayed diagnosis. Growing evidence suggests that multiparametric magnetic resonance imaging (mpMRI) may offer a more acceptable and accurate first-line examination.

Objectives: To review the literature evaluating whether mpMRI improves adherence to prostate cancer early detection compared with traditional methods and whether an MRI-first strategy may reduce false positives, minimize unnecessary biopsies, and enhance diagnostic outcomes in primary care settings.

Methods: A narrative literature review was conducted using PubMed, Scopus, and Web of Science (2015–2024). Search terms included prostate cancer, screening, adherence, digital rectal examination, TRUS, mpMRI, and early detection. Inclusion criteria: peer-reviewed studies, meta-analyses, randomized trials, guideline statements, and implementation pilots evaluating diagnostic accuracy, patient acceptance, or screening outcomes. Exclusion criteria: imaging protocols, treatment-focused studies, or incomplete datasets. Findings were synthesized thematically.

Results: Across studies, DRE refusal ranged from 8–22%, and TRUS-biopsy refusal from 15–30%, representing a significant barrier to early detection. PSA-based strategies produced high false-positive rates, with up to 75% of elevated PSA results not indicating cancer. mpMRI demonstrated higher sensitivity and specificity for clinically significant disease and consistently reduced unnecessary biopsies through targeted sampling. Real-world data (e.g., PROMIS, PRECISION trials; PRAISE-U pilot

programs) showed high patient uptake of MRI and improved identification of clinically meaningful lesions. However, long-term evidence on population-level mortality benefit for MRI-first screening remains limited.

Discussion: The literature suggests that mpMRI may mitigate adherence barriers created by invasive traditional steps, while improving diagnostic discrimination and reducing overdiagnosis. Implementation feasibility depends on resource availability, radiological expertise, and equitable access.

Conclusion: Evidence supports mpMRI is more acceptable and diagnostically advantageous early-detection tool. While not yet validated as a universal first-line screening method, an MRI-first approach shows promise for improving adherence and reducing late diagnosis, warranting further prospective evaluation in primary care.

ID 873- Improving cervical cancer prevention in remote villages

Anush SARGSYAN

Health For Armenia, Gyumri, Arménie

Context: This Health Center serves 19 villages surrounding a small town. Cervical cancer screening coverage in the area has been very low, and vaccine hesitancy has been rising, including due to misinformation. This project aimed to increase Pap smear testing and readiness to receive HPV vaccination.

Methods: Prior to the project, many village women faced transport barriers, had limited knowledge about cervical cancer, and rarely attended the Center for screening. The team (director, gynecology nurse, family nurse, village nurses, and family doctor) therefore organized scheduled village visits to conduct Pap smear tests on site. Concurrently, group lectures and individual conversations were held to raise awareness about cervical cancer and the HPV vaccination. Challenges included severe weather conditions, registration errors, low public awareness, misinformation (internet, social media), and incomplete data.

Originality: According to WHO, cervical cancer is the second most common cancer worldwide among women aged 25-69 In this country, cervical cancer ranks third after breast and colorectal cancer. The implementation of village visits represents a new model of proactive,

Lessons learned and future implication: It is important to ensure a team's mutual trust and respect. The same project and approach may not work everywhere and should be adapted to local contexts. Stakeholders should be engaged early to ensure trust and buy in within the community. The standardi

Discussion: As a result of the intervention, Pap smear screening rate increased from less than 1% in 2024 to almost 13% in the first 9 months of 2025. More parents reported understanding of the importance of the HPV vaccination of their 13-year-old daughters. Completed data for 2025 will be included in the final poster.

Conclusion: Reaching rural communities requires different strategies than the typical approach.This project demonstrated how team-based community outreach can improve participation in screening and patient education, contributing to cervical cancer prevention and reducing future burden on the healthcare system.

ID 530- Shared decision-making in colorectal cancer screening program : the perspective of patients, pharmacists and general practitionners

Marlène SOARES, Héloïse GARNIER, Anne-Lise VOUILLOT, Amélie AÏM-EUSÉBI, Julie ETCHEBERRY, Isabelle AUBIN-AUGER

Université Paris Cité, Paris, France

Context: Colorectal cancer (CRC) is a common cancer with a poor prognosis if detected late. The participation in screening program remains insufficient. Our study was ancillary to the FACELE study, a pragmatic randomized controlled trial investigating the superiority of training general practitioners (GPs) in a patient-centered approach to implement shared decision-making (SDM) in CRC screening program.

Objectives: The objective of our study was to explore the understanding and adoption of SDM by patients, pharmacists and GPs in CRC screening program.

Methods: We conducted three qualitative studies using an approach inspired by the grounded theory. The interviews were individual. The sample was constructed using theoretical purposive sampling. The data were manually coded with triangulation of the analysis.

Results: Eleven interviews were conducted for each population group between May 2024 and March 2025. Patients' approaches to SDM varied depending on their stance towards care, ranging from directive to compliant, debating to distant. Although SDM appeared to play only a limited role in CRC screening program, the overall approach of SDM was recognized by all patients, albeit heterogeneous. The use of SDM did not systematically imply a balanced final decision. Pharmacists wear many hats, from technician to treating physician, including verifier, distributor, informant, and advocate. They did not readily adopt the concept of SDM within the context of CRC screening program. Despite their desire to persuade, respecting patients' refusals and their free will remained paramount. GPs widely adopted SDM and personalized it: there wasn't one SDM, but several SDM, applied at different stages of the consultation. SDM and the GP's role could be at odds, particularly regarding their "savior" role.

Discussion: The main strength of this study lies in the plurality of perspectives. The variety of definitions of SDM is consistent with the literature. This study highlighted the advantages of multidisciplinary collaboration and the importance of consistent training for all healthcare professionals.

Conclusion: The concept of SDM remains unclear for its various stakeholders, sometimes seen as a lever or a hindrance in CRC screening program. They each use it in their own way, but always with the aim of prioritizing the caregiver-patient relationship and promoting patient empowerment.

ID 338- Risk of fracture among lung cancer survivors: a population-based retrospective cohort study

Seonghye KIM [(1)] , Kyung-Do HAN [(2)], Jinhyung JUNG [(3)], Dong Woog YOON [(4)], Jong Ho CHO [(1)], Dong Wook SHIN [(1)]

(1) Samsung Medical Center, Seoul, Corée, République de
(2) Soongsil University, Seoul, Corée, République de
(3) Sungkyunkwan University, Seoul, Corée, République de
(4) Chung-Ang University Hospital, Seoul, Corée, République de

Context: Evidence regarding the incidence of fractures among lung cancer (LC) survivors remains limited.

Objectives: We assessed the fracture risk in LC survivors who underwent curative-intent surgery, stratified by cancer treatment modalities and postoperative time.

Methods: A retrospective, population-based cohort study was conducted utilizing the Korean National Health Insurance Service database (2009–2022). The study included LC survivors (n = 33,292) and 1:3 age- and sex-exactly matched controls (n = 99,876). Competing risk analyses were performed, with all-cause mortality considered as a competing risk.

Results: We found that LC survivors had an elevated risk of fractures compared to non-cancer controls during the overall follow-up, with a particularly increased risk of vertebral (cause-specific hazard ratios [csHRs] 1.81, 95% confidence interval [CI] 1.45–2.26) and hip fractures (csHR 1.40, 95% CI 0.98–1.98) within the first year following surgery, after which the risk decreased. The risk of any fracture was prominent in LC survivors receiving radiation therapy (RT) (csHR 1.78, 95% CI 1.43–2.23) or chemoradiotherapy (CRT) (csHR 1.73, 95% CI 1.50–1.99).

Discussion: We identified an elevated risk of fractures among LC survivors compared to non-cancer participants throughout the entire follow-up period, with especially heightened risks for vertebral and hip fractures observed during the first year post-surgery, followed by a subsequent decline. Factors such as the extent of surgical intervention

and the presence of pre-existing pulmonary disease may contribute to extended hospital stays or reductions in physical activity, increasing susceptibility to weight loss, sarcopenia, or falls. Our findings highlight the importance of comprehensive management strategies, with particular attention to LC survivors who received RT or CRT.

Conclusion: LC survivors exhibited a consistently greater risk of fractures compared to non-cancer controls, with a substantially higher risk of both vertebral and hip fractures during the initial year after surgery among those treated with RT or CRT.

ID 73- Obstacles to lung cancer screening in general practice in Belgium. A mixed study focusing on factors related to French- and German-speaking general practitioners.

Julia Karoline HEIBEYN (GEB. KARRENBROCK)

Université De Liège, Liège, Belgique

Context: Lung cancer screening (LCS) using low-dose computed tomography (LDCT) has the potential to reduce mortality through detection in an early, asymptomatic stage. Despite its proven effectiveness, implementation remains limited in Belgium, where currently no uniform screening program exists. General practitioners (GPs) play a critical role in promoting screening uptake, yet various physician-related barriers may hinder this process.

Objectives: Identify general physician related obstacles to lung cancer screening in the french and german speaking regions of Belgium.

Methods: This thesis was conducted in two phases. First, a scoping review was performed using PubMed to identify physician, patient and healthcare system related obstacles to cancer screening across various cancer types, namely lung, colorectal, breast and cervical cancer. 79 articles published between 2019 and 2024 in English, French, and German were included. From this review, 22 physician-related barrier themes were extracted. Secondly, these themes informed the development of an online questionnaire targeting GPs in the French and German speaking regions of Belgium to identify priority barriers for countermeasures. The survey assessed GP-perceived barriers to LCS, opinions concerning LCS, and factual knowledge of current screening guidelines.

Results: The online survey yielded 43 valid responses. The top three barriers, consistent across both frequency and strength of endorsement, were the inability to bill separately for LCS counselling (100%), non-use of shared decision-making (SDM) tools (94.6%), and lack of use of risk evaluation tools (91.9%). Knowledge questions revealed that while most participants correctly identified LDCT as the appropriate screening method, only 34.9% were aware of the correct screening interval (1 year), and just 37.2% identified correct pack-year eligibility thresholds. A total of 80.5% expressed a need for more training to feel confident in recommending LCS.

Conclusion: This study highlights key physician-related barriers to the implementation of LCS in (French and German speaking) Belgian general practice. The findings suggest a strong need for targeted educational interventions, better integration of SDM and risk evaluation tools, and systemic adaptations such as billing reforms. While exploratory in nature due to the limited sample size, these insights provide a foundation for future interventions aimed at improving LCS uptake and supporting GPs in evidence-based screening practices.

Care organisation & referrals

ID 2082- From waiting to recovering? Healthcare utilization in general practice of patients referred to specialized mental healthcare: a data-linkage study

Julia BES [1] , Marieke PAPE [2], Robert VERHEIJ [1], Elise BOERSMA-VAN DAM [1]

(1) Netherlands Institute For Health Services Research, Utrecht, Pays-Bas
(2) National Healthcare Institute, Diemen, Pays-Bas

Context: In the Netherlands, patients with mental health problems often face long waiting times for specialized mental healthcare (SMH) after referral by their general practitioner (GP). During the waiting period, patients may use GP services which can support mental health recovery but also entail risks, such as prolonged medication use. Little is known about the type and amount of care these patients use for their mental health problems in general practice while waiting.

Objectives: We investigated the type and intensity of care utilization in Dutch general practices of patients referred to SMH, to identify areas for improving GP care delivery.

Methods: We used electronic health records from GPs and claims data from patients referred to SMH (N=27,747) between 2022 and 2023. We analyzed healthcare utilization for mental health problems in terms of GP care, mental health nurse (MHN), or drug prescriptions of these patients within 12 months after referral to SMH. Patient- and practice characteristics were compared between users and non-users of GP services during the waiting period.

Results: Preliminary **Results:** Of the referred patients, 61.6% utilized care for mental health problems in general practice while waiting for SMH. Most of the patients utilized care provided by GPs (53.0%) and to a lesser extent by MHN (23.7%). One in eight patients (12.6%) received a new drug prescription during the waiting period, most commonly an anxiolytic (7.5%). Further results will be presented at the conference.

Discussion: More than half of the patients referred to SMH utilize care for mental health problems in general practice, which may reduce the time available for patients with mild psychological problems manageable in primary care. Firstly, reducing waiting times for SMH is key to reduce the burden on GP services. Secondly, providing GPs and MHNs with guidance on supporting patient's recovery during the waiting period could be important to enhance patient care.

Conclusion: Our findings highlight that the burden of care in general practice invoked by patients with a referral to specialized mental health care seems to be considerable.

ID 1893- An Audit of Lumbar Spine X-Ray Requests from Primary Care: Do They Meet Referral Criteria?

Prithika JOTHIMURUGAN [1] , Sagar MAHESHWARI [2]

(1) Barts And The London School Of Medicine And Dentistry, London, Royaume-Uni
(2) Barking, havering And Redbridge University Hospitals Nhs Trust, London, Royaume-Uni

Context: Low back pain (LBP) is the most common musculoskeletal presentation in primary care, contributing to a significant physical, emotional, and socioeconomic burden. LBP in primary care is estimated to cost the National Health Service (NHS) £5 billion annually. 90-95% of LBP cases are regarded as non-specific, with no underlying spinal pathology. Despite this, lumbar spine radiography is often used in initial assessments. This results in unnecessary radiation exposure, with approximately 65 times the dose used in chest radiography, and avoidable healthcare costs.

Objectives: To review 100 lumbar spine radiography requests from primary care for LBP, assessing compliance with the 2016 NICE guidelines and the 2017 Royal College of Radiologists' referral guidelines, iRefer.

Methods: This retrospective study included the initial 100 patients who had been referred to an NHS Trust for lumbar spine radiography during May 2024. Data was collected from hospital radiology records. Requests were compared against NICE and iRefer guidelines and analysed accordingly.

Results: 59% of X-Ray requests met NICE criteria, whilst 44% met iRefer criteria. The most common clinical indication was for a suspected fracture, accounting for 32% of the X-Ray requests. The most frequent clinical finding was degenerative changes, reported in 68% of lumbar spine X-Rays. Osteoporotic fracture was found in 5% of X-Rays.

Discussion: Compliance with NICE guidelines was greater than compliance with iRefer, likely due to NICE's broader recommendations and accessibility, whereas iRefer's specificity and annual £120 subscription may limit use by GPs. Although MRI remains the preferred imaging modality for disc and soft tissue pathology, long waiting times, patient intolerance, contraindications, and increased costs can result in X-Ray use. The majority of lumbar spine X-Rays demonstrated only degenerative changes, which are better diagnosed clinically. This illustrates how clinical practice must align more closely with NICE and iRefer criteria, to reduce unnecessary radiation exposure and optimise the use of resources.

Conclusion: Although lumbar spine X-Ray has a role in diagnosing fractures, a large proportion of X-Ray requests did not meet both NICE and iRefer guidelines, demonstrating the need for improvement. Maximising adherence requires increased access to guidelines, education for both clinicians and patients, and regular audits.

ID 1350- Impact of pre-hospital intervention in severe trauma patients in emergency care

Emna AYACHI, Yessmine WALHA, Wiem DEMNI, Eya OUERGHI, Feten SEBAI, Lina HAMDI, Nourelhouda NOUIRA

Mongi Slim University Hospital, Tunis, Tunisie

Context: Severe trauma is a leading cause of death and disability worldwide, requiring rapid and coordinated intervention to optimize survival. Approximately 20% of trauma-related deaths are considered preventable with timely and appropriate management from the first moments after injury.

Objectives: This study aimed to compare epidemiological, clinical, diagnostic, therapeutic, and outcome characteristics of patients presenting by their own means versus those transported via prehospital services, and to assess the impact of prehospital intervention on prognosis.

Methods: We conducted a retrospective, observational, descriptive, and analytical study in the emergency department from January 1st to December 31st, 2023. The study included patients admitted to the vital emergency room for severe trauma. We analyzed the means of transport to identify particularities of patients benefiting from prehospital medical transport and to evaluate its impact on prognosis.

Results: A total of 391 patients were included, with a mean age of 39±17.34 years and a male-to-female ratio of 4.75. Comparing patients transported via prehospital services to those arriving by their own means, significant differences were observed: hemostasis disorders (6.1% vs. 0%), anticoagulant or antiplatelet therapy (10% vs. 7.6%), neurological distress (12.3% vs. 2.4%), cerebral (50.8% vs. 35.4%), pelvic (12.9% vs. 1.2%) and peripheral (19.1% vs. 9.8%) injuries on imaging. Prehospital patients also required more advanced interventions, including vasopressin (11.7% vs. 2.4%), tranexamic acid (21.2% vs. 8.5%), oxygen therapy (66.7% vs. 52.4%), and orotracheal intubation (13.3% vs. 1.2%). Logistic regression identified independent predictive factors for in-hospital mortality: age, heart rate, systolic blood pressure <90 mmHg, peripheral injury, and orotracheal intubation.

Discussion: Prehospital management has been consistently shown to reduce mortality in severe trauma by enabling earlier stabilization and faster access to definitive care, as reported in previous studies (Kim et al., 2025; Murad et al., 2012). Our findings are consistent with this evidence, showing that prehospital-transported patients presented with more severe injuries and required advanced interventions, reflecting effective early triage and initiation of critical care.

Conclusion: Prehospital transport improves the vital prognosis of severe trauma patients. Enhanced coordination among emergency services and targeted training for prehospital personnel are essential to further optimize outcomes.

ID 1290- Public perceptions of medical referrals (qualitative "social listening" across forums)

Karl Oskar BJÖRKMAN [1] , Julia SOLLERHED [2]

(1) Region Jönköpings Län, Vetlanda, Suède
(2) Region Jönköpings Län, Nässjö, Suède

Context: Primary–secondary referral systems aim to coordinate care and steward specialist capacity, yet patients' lived experiences are often under-captured. We synthesised public narratives about referrals, access and collaboration in primary care across large, open online communities, to identify pragmatic improvements primary-care teams can implement.

Objectives: (1) Characterise how people describe the experience of being referred, referral decision-making, waits and navigation; (2) identify common "workarounds" and perceived drivers; (3) compare patterns across healthcare contexts; (4) surface primary-care actions that could reduce friction.

Methods: Multi-platform netnography of publicly accessible discussions (2010–2025). Under author instruction and oversight, large language models (LLMs) performed all core steps: locating relevant open forums/social-media communities via neutral search terms; screening threads/posts and curating the corpus (private/paywalled spaces excluded); de-identifying content and paraphrasing quotations; and conducting inductive thematic analysis (LLMs generated codes, consolidated codebooks, clustered themes and drafted analytic memos). No interaction with users occurred; only public data were analysed; no REC/IRB review was sought. To preserve anonymity here, platforms and localities are not named.

Results: Across several hundred posts in dozens of threads, five recurrent themes emerged: (1) Gatekeeping & perceived dismissal—reluctance to refer and multiple visits before escalation; a minority defend guideline-concordant GP management. (2) Waits & the "black hole"—limited status feedback and long delays fuel anxiety; knowledge of rights/processes varies. (3) Workarounds & advocacy—self-referrals where allowed, switching clinics/clinicians, private/online routes and, at times, symptom exaggeration. (4) Navigation & communication gaps—unclear responsibility during the wait; some rejections lack actionable feedback. (5) Positive counter-narratives—prompt GP action or effective primary-care management builds trust. Patterns differed by system: tax-funded settings emphasised waits/opacity; insurance-based settings highlighted cost/administrative burden, but core frustrations were shared.

Discussion: Findings echo known access and communication issues while detailing how barriers are experienced. Limitations include self-selection, unverifiable accounts and platform bias. Practical levers include clear, plain-language referral explanations; proactive timeline/status updates with a named contact; contingency plans ("if-not-better-by-X, escalate"); rapid advice-and-guidance; and leveraging continuity to reduce "performing" severity.

Conclusion: A multi-platform, anonymised netnography highlights consistent pain points—and low-cost, GP-led remedies—that can reduce avoidable revisits, anxiety and delays in referral pathways.

ID 1276- The Neuroleptic Malignant Syndrome Mirage: A Five-Year study of Suspected Cases in the emergency department

Ons EL MEJRI, Camillia JEDDI, Yosra AZZABI, Mohamed KILANI, Hafedh THABET

Department Of Emergency Medicine, Mahmoud Yaacoub Center For Urgent Medical Assistance, Tunis, Tunis, Tunisie

Context: Neuroleptic Malignant Syndrome (NMS) is a rare but potentially fatal complication of both typical and atypical antipsychotic medications. Its diagnosis remains particularly challenging, as it can easily be mistaken for other medical conditions with similar clinical presentations.

Objectives: We aimed to determine the final rate of confirmed diagnoses among patients referred to the emergency department (ED) for suspected NMS.

Methods: This was a retrospective, observational, single-center study conducted in the ED of Mahmoud Yaacoub for Urgent Medical Assistance over a five year period from January 2020 to october 2025.We included all patients aged over 18 years who were referred to our ED for suspected NMS. Epidemiological, clinical, and therapeutic data were collected. The presence of diagnostic criteria

(clinical and biological) was assessed at two time points, before and after ED referral. The diagnosis of NMS was confirmed or excluded based on well-established diagnostic criteria.

Results: A total of 99 patients were evaluated for suspected NMS (mean age 35.4 ± 13.8 years; sex ratio = 6.62). Nearly all patients (99%) were receiving neuroleptic therapy, predominantly for schizophrenia (61.6%). On pre-referral assessment, 86.7% exhibited extrapyramidal signs, 22.4% had altered consciousness, and 40.8% were febrile. Upon ED arrival, these proportions were 45.5%, 15.2%, and 19.2%, respectively. Rhabdomyolysis was identified in 46.4% of cases. Most patients received supportive treatment, primarily intravenous hydration (78.6%); 18.2% required intensive care admission. Ultimately, NMS was confirmed in 22 patients (22.2%). In others, symptoms were attributed to iatrogenic (45.5%), infectious (10.1%), or miscellaneous causes. The median number of diagnostic criteria fulfilled before and after referral was comparable (2 [2–3] vs. 2 [1–3]).

Discussion: Many suspected cases were ultimately unrelated to true NMS, underscoring its frequent mimics. Using standardized criteria is essential for accurate diagnosis and appropriate management.

Conclusion: NMS remains a complex diagnostic entity in emergency settings, often mimicked by other conditions. Standardized diagnostic criteria play a critical role in distinguishing true NMS from its clinical imitators, enabling timely and appropriate management.

ID 1237- Evaluating an urgency-based four-track referral pathway in a regional primary care system

Karl Oskar BJÖRKMAN [(1)] , Martin REJLER [(2)], Arvidsson EVA [(3)], Fristedt SOFI [(3)]

(1) Region Jönköpings Län, Vetlanda, Suède
(2) Region Jönköpings Län, Eksjö, Suède
(3) Region Jönköpings Län, Jönköping, Suède

Context: Referrals from primary to secondary care have risen for years, delaying care, adding cost, and burdening clinicians. Strengthening primary care means keeping appropriate patients in primary care and ensuring that those who need secondary care get there fast. In XXX, a health system serving >300,000 residents, a system-wide, urgency-based four-track pathway was launched to streamline referrals and help GPs refer the right patients: (1) senior-coordinated direct admission for acute cases, (2) on-demand specialist advice, (3) multidisciplinary conferences (MDT) for complex cases, and (4) reverse referral from hospital/EMS to primary care.

Objectives: Estimate the association between pathway launch and referral intensity; assess denial rates and e-consult use; explore heterogeneity across specialties and clinics.

Methods: Population-level interrupted time-series using the complete referral registry in XXX. Dataset includes every primary-care-initiated referral to secondary care (incl. ED), monthly Jan 2015–Dec 2024: total 1,880,623 (standard 1,738,383; consultation-type 142,240). Activity denominators: all primary-care contacts 14,378,586. Primary outcome: referrals per 1,000 primary-care visits; counts supportive. Segmented ITS with seasonality and a pandemic segment; HAC-robust errors. Pre-specified robustness: alternative anchors and a first-difference model. Subgroup analyses by receiving specialty (incl. ED) and clinic. Quality-improvement evaluation using administrative data; no patient-level identifiers.

Results: Preliminary analyses shows a negative post-intervention slope in referrals per 1,000 visits, consistent with progressively fewer referrals over time. Reductions concentrate in medical and surgical specialties; psychiatry appears unchanged to slightly higher. Referrals to ED show no clear change beyond seasonality. Denial rates show no consistent change. E-consults rose around implementation and then stabilised. Effects vary across clinics. Findings are directionally similar under alternative anchors and differencing;

interpretation is tempered by pandemic-recovery dynamics and ongoing data cleaning and follow-up.

Discussion: An urgency-based pathway that supports GPs (specialist-on-demand, MDT) can lower low-value referral propensity without changing acceptance thresholds. Variation across clinics and recovery dynamics motivate continued training, simple access to pathway tools and routine activity-adjusted monitoring.

Conclusion: At regional scale (>300,000 residents), the four-track pathway is associated with early, system-level signals of reduced referral intensity. Pending full follow-up and planned sensitivity analyses, the model appears feasible and potentially scalable for sustainable primary–secondary collaboration.

ID 528- The role of out-of-hours general practice care in the Dutch healthcare system

Corinne RIJPKEMA, Karin HEK, Lotte RAMERMAN

Nivel, Utrecht, Pays-Bas

Context: The Dutch healthcare system is built on a strong primary care foundation, with general practitioners (GPs) serving as gatekeepers to secondary care. Outside office hours, patients with acute, urgent but non-life-threatening health problems are advised to contact the out-of-hours (OOH) GP services. These services play a key role in maintaining access to emergency care. At the same time, OOH GP services act as a “canary in the coal mine”, with care utilization reflecting how well daytime general practice meets patients’ needs. For instance, when care for older adults (75+) is insufficiently tailored, they are more likely to contact the OOH GP service with acute health problems.

Objectives: To explore two roles of OOH GP care in the Dutch healthcare system: (1) as a gatekeeper preventing unnecessary emergency care, and (2) as an indicator of daytime general practice accessibility and performance.

Methods: We used routinely collected data from electronic health records of OOH GP services (2019-2025). For objective 1, we analyzed the proportion and characteristics of patients who were referred to the emergency department (ED), ambulance dispatch center, or cardiac emergency unit following an OOH GP contact. For objective 2, we examined trends in OOH GP utilization among adults 75+ and their associated health problems.

Results: 1) A small proportion (7%) of patients is referred to emergency care. Most patients are referred to the ED (5.3%), after contact with a GP (84.7%), a home visit (11.2%) or a triage consultation (4.1%), and patients are most often referred for abdominal pain (8.8%). 2) Between 2020 and 2024, OOH GP contacts per 1,000 adults aged 75+ declined, mainly due to fewer consultations for specific reasons, including a 50% drop in diabetes-related contacts and a 25% decrease in contacts related to medication side effects.

Discussion: The OOH GP services manage most urgent health problems themselves, potentially preventing unnecessary hospital and ED visits. The decline in contacts among adults aged 75+ seems driven by fewer consultations for conditions such as diabetes, possibly reflecting better daytime management.

Conclusion: The findings highlight OOH GP services as both a vital part of the healthcare system and a barometer of daytime GP performance.

(2) University Of Coimbra, Coimbra, Portugal
(3) Catholic University Of Porto Pt, Porto, Portugal
(4) University Of Porto Pt, Porto, Portugal
(5) University Of Coimbra Pt, Coimbra, Portugal

Context: Family conferences (FC) are a structured and therapeutic tool in palliative care, promoting effective communication between the healthcare team, patient and family. They are especially relevant for patients with high clinical complexity, both in hospital settings and in primary care.

Objectives: To evaluate the impact of FC on patients followed by palliative care teams and on complex patients dependent on primary health care (PHC), as well as the perception of caregivers on the quality of care provided.

Methods: Observational, analytical and cross-sectional study, with application of a specific questionnaire to caregivers of patients followed by a community palliative care team and a family health team. Sociodemographic and clinical variables and perceptions of the impact of FC on the understanding of the disease and its trajectory, on satisfaction and on the feeling of security and trust were analyzed.

Results: The total sample included 38 caregivers, of whom 20 were accompanied by a team specialized in palliative care and 18 by a family health team. There was a high percentage of female caregivers (78.9%), with a mean age of 58.1 years, and the mean age of patients was 80.7 years. FC was associated with improved perception of communication (9.36 ± 0.65), collaboration (9.50 ± 0.86) and implementation of care strategies (9.45 ± 0.83). The presence of professionals such as social workers and psychologists in the FC of the palliative care team associated with greater family participation ($p = 0.002$) and greater perceived support ($p = 0.001$). Among the patients who died, there was a significant correspondence between the desired and actual place of death ($p = 0.007$), demonstrating FC as an effective instrument for planning. The presence of more family members in the FC correlated with greater hospital use in the previous month ($p < 0.001$) and with greater case complexity.

Discussion: FCs have proven to be effective in improving communication, planning and aligning care with patient and family preferences. Their regular implementation, especially in PHC, should be promoted with multidisciplinary teams and specific training.

Conclusion: The study shows FCs improve teamwork, communication, care planning, and align preferred and actual death places. They boost end-of-life care quality, psychosocial support, and treatment confidence, emphasizing health literacy, team training, and routine use.

ID 1998- Association Between Caregiver Burden and Sleep Quality Among Caregivers of Patients in Palliative Care Centers: A Cross-Sectional Study

Hande BÜYÜKDAĞ NAM, Nil TEKIN

University Of Health Sciences Izmir Faculty Of Medicine, Department Of Family Medicine, Izmir, Türkiye

Context: Palliative care addresses not only patients but also the physical, psychological, and social well-being of caregivers. Caregiving burden may negatively affect sleep quality and overall health, making it essential to understand its impact to improve caregiver well-being and palliative care quality.

Objectives: This study aims to examine the relationship between caregiver burden and sleep quality among caregivers of hospitalized palliative care patients and to contribute to identifying caregiver needs and improving person-centered, sustainable care.

Methods: This cross-sectional study was conducted over three months with 102 caregivers using face-to-face surveys. Data were collected with a sociodemographic questionnaire, the Zarit Caregiver Burden Scale, and the PSQI, and analyzed using IBM SPSS 25.0 with appropriate statistical tests.

Results: Most caregivers were women over the age of 50, married, retired, of moderate income, and high school graduates. The majority were spouses or children of the patients. The mean caregiver burden score was 35.37±15.16, indicating a moderate level

of burden, while the mean PSQI score was 10.86±3.48. Overall, 79.4% of caregivers had poor sleep quality. Caregiver burden and sleep quality did not differ significantly according to age, gender, marital status, number of children, or income level. However, caregiver burden was significantly associated with degree of relationship to the patient, longer caregiving hours, presence of chronic disease, education level, and receiving financial compensation. A strong, positive, and statistically significant correlation was found between caregiver burden and PSQI scores.

Discussion: The presence of chronic diseases, psychiatric comorbidities, the nature of caregiving, and environmental factors in which care is provided emerged as key determinants influencing both caregiver burden and sleep quality. These results emphasize the importance of psychosocial interventions, sleep hygiene education, and regular follow-up programs aimed at supporting caregivers, and suggest that reducing caregiver burden may improve sleep quality.

Conclusion: This study shows that increased caregiver burden negatively affects sleep quality. Family medicine, with its holistic and continuous care approach, plays a key role in the early identification of caregivers at risk. Regular follow-up, psychosocial support, and appropriate referrals provided by family physicians may reduce caregiver burden and improve sleep quality, contributing to more effective and person-centered palliative care.

ID 1954- Enhancing triadic communication in primary care: bridging physicians, older adults and caregivers - an integrative literature review

Camila Cristina DE OLIVEIRA RODRIGUES, Nicolle Stefane DA SILVEIRA DA COSTA

Faculdade São Leopoldo Mandic Araras, Araras, Brésil

Context: Given that diverse life contexts of older adults may impede effective physician communication and exacerbate dependency, understanding triadic interactions (physician–patient–caregiver) within Primary Health Care (PHC) systems, such as Brazil's Unified Health System, is critical. Poor treatment adherence among older adults and evidence showing that nearly 40% of medical errors in this population stem from communication failures highlight the urgency of addressing this issue to improve patient safety and health outcomes.

Objectives: To analyze the multidimensional aspects of triadic communication in Primary Health Care through a literature review.

Methods: An integrative review was conducted using the Virtual Health Library databases. The search strategy applied Boolean operators with combined terms: (elderly OR "older adults") AND (caregivers OR family) AND ("primary health care") AND (communication OR "physician–patient relationship"). Studies published between 2010 and 2025 addressing communication involving older adults and/or caregivers were included and analyzed through thematic synthesis. Articles unrelated to the topic, duplicates or those outside the Primary Health Care context were excluded. Data were synthesized thematically to identify key dimensions and recurring patterns. The methodological rigor aimed to ensure reliability in the selection and interpretation of evidence.

Results: Of 325 articles identified, 17 addressed the topic broadly, 9 aligned with the study focus, and 317 were excluded. Findings reveal weaknesses in professional training, predominance of biomedical practices, and gaps in teamwork. Cultural competence and contextual factors are critical for effective communication.

Discussion: Triadic communication is a complex and multifaceted phenomenon. Evidence highlights a persistent tension between respecting patient autonomy and effectively integrating the caregiver. The caregiver's role is paradoxical, acting either as a facilitator or diverting attention from the older adult's care needs. The use of digital tools and structured checklists enhances interaction. Developing skills to mediate conflicts and adapt communication strategies according to cognitive level and patient context is essential for improving care quality.

Conclusion: It is concluded that triadic communication requires professionals to develop relational and expressive competencies,

demonstrate flexibility in adopting context-specific strategies, and apply creativity in designing tools that support person-centered care. Future studies should evaluate interventions that strengthen triadic communication and measure their impact on patient safety and health outcomes.

ID 1800- Navigating the Double Burden: A Systematic Review of Challenges and Coping Strategies in the Sandwich Generation

Christine LANIPAO-GAERLAN

Collado, Jaye Anne, Tuguegarao City, Philippines

Context: The sandwich generation comprises adults who simultaneously care for their aging parents and dependent children. This growing phenomenon reflects global demographic changes such as increased life expectancy, delayed parenthood, and economic pressures. These dual caregiving roles expose individuals to multifaceted physical, emotional, and financial challenges that affect overall well-being.

Objectives: This systematic review aims to examine existing literature on the challenges and coping strategies experienced by the sandwich generation and identify implications for health and social policy.

Methods: Following the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) guidelines, a systematic review was conducted. Three independent reviewers searched PubMed, Medline, ScienceDirect, CENTRAL, the Wiley Online Library, JBJS, and Google Scholar for studies published from January 2020 to November 2024. Search terms included “sandwich generation,” “challenges,” “coping strategies,” “physical health,” and “mental health.” Eligible articles included English-language studies with quantitative or qualitative designs addressing caregiving experiences within the sandwich generation. Data extraction and quality appraisal followed the Cochrane Review Group’s 10-item assessment tool.

Results: Out of 1,268 records identified, five studies met the inclusion criteria. The reviewed literature revealed consistent themes of emotional strain, time pressure, and financial burden. Caregivers reported stress, fatigue, and reduced self-care. Common coping strategies included seeking social support, practicing mindfulness, and time management. Gender disparities were observed, with women experiencing greater caregiving load and emotional distress.

Discussion: Findings highlight the dual challenges and adaptive resilience of the sandwich generation. Strengthening institutional support, workplace flexibility, and community-based programs is crucial to sustain their well-being and caregiving capacity.

Conclusion: This review demonstrates that sandwich-generation caregivers shoulder significant emotional, physical, financial, and time-related burdens that compromise their well-being. Nonetheless, caregivers display considerable resilience through adaptive coping strategies and social support systems. Gender disparities further intensify the caregiving experience, disproportionately affecting women across emotional, physical, and economic dimensions. Supporting these caregivers is not merely a matter of individual well-being but a societal imperative, as their ability to function effectively influences family stability, workforce participation, and the health of dependents across two generations.

ID 1558- Culturally adaptive AI chatbot to support real-time mental-health screening among foreign caregivers in primary care

Yuval SHACHAF, Amit GIBORI, Hanny YESHUA

The Department Of Family Medicine, Tel-Aviv District, Clalit Health Services, Israel, Tel Aviv, Israël

Context: Foreign caregivers frequently experience emotional distress related to isolation, demanding work conditions, and limited access to mental-health resources. Communication barriers such as culturally shaped ways of expressing distress, indirect language, and unfamiliarity with mental-health terminology often challenge early detection in primary care. Family physicians require practical,

low-cost tools that facilitate culturally sensitive dialogue during the consultation while preserving clinical judgment.

Methods: We implemented a culturally adaptive AI chatbot, built on an open-source language-model architecture, to support real-time communication and early mental-health screening during primary-care encounters. Development was guided by mapping clinicians' communication challenges and identifying culturally patterned expressions of distress among foreign caregivers. During the visit, the physician activates the chatbot on a shared screen and uses it interactively with the caregiver. The chatbot reformulates validated screening questions such as PHQ 9 and GAD 7, brief standard tools for detecting depression and anxiety, into culturally aligned and simplified language. It identifies potential indicators of distress and offers culturally appropriate phrasing options to facilitate deeper exploration. The tool functions as a real-time communication mediator, while the physician remains the sole interpreter and decision-maker.

Originality: Integrated directly into the clinical encounter, the chatbot serves as a dynamic, culturally adaptive communication tool that supports meaning-centered dialogue under full clinician control. Its open-source design allows adaptation across clinical environ

Lessons learned and future implication: Early use suggested improved mutual understanding, greater patient engagement, and more reliable completion of screening tools. Physicians reported that the chatbot helped surface emotional concerns that might otherwise remain unspoken. Key challenges inc.

Discussion: Embedding AI as a live communication partner can help clinicians initiate mental-health discussions in multicultural settings while preserving clinical autonomy and human connection. This approach showed acceptability and added value in routine practice.

Conclusion: A culturally adaptive AI chatbot used during primary-care encounters can strengthen early mental-health assessment among foreign caregivers by improving communication, diagnostic clarity, and engagement. This clinician-centered model offers a scalable and practical innovation for multicultural primary care.

ID 1543- General Practicioner role during Caregivers bereavement Journey

Anna DI GIUSEPPE

Universite De La Réunion, Saint Denis, France

Context: Caregivers (CG) have been recently recognized by the law, but their status ends at the time of the caregiver's death. Thus, mourning is a major fragility period for CGs.General Practitioner remains a primary actor during caregiving period, but little is known about its role during CG mourning.

Objectives: The aim of this study was to assess CGs experience of the bereavement and what was the role played by GPs during this delicate period .

Methods: A qualitative analysis based on grounded theory approach was carried out on bereaved CGs. Primary assumptions were set interviewing end-of-life professionals' caretakers, then 14 CGs were interviewed using semi-structured interview methods. Analysis and triangulation coding with an external researcher were made, as well as an adaptation of the semi-structured interview until sufficiency of data

Results: CG bereavement experience relates to caregiving experience as well. Gradual loss of control over the situation reach its climax with the loved one's death. CG stars then a journey of a "double bereavement": the loved one's and his caregiving role as well, in order to rebuildhis identity and become someone else. GP relationship may facilitate or hinder this path or remain independent of CG/caregiver role. In the background of this journey, we found two other actors influencing CG experience: health care system and family/social network. Covid-19 pandemic was another constraint bereaved CGs had to cope with.

Discussion: CGs listed some suggestions on their regards. They would like their expertise taken into account, as well as logistic help (home visits, address book, etc.). Moreover, they would like to open a discussion on end-of-life issues. This will allow them to prepare themselves, but also to express their

feelings, in order to try to move forward during bereavement. GP seems to be a privileged partner to discuss these issues.

Conclusion: Our findings highlight the pivotal role of the General Practitioner, whose empathic presence and proactive engagement can ease caregivers' emotional burden, facilitate meaning-making, and support a healthier bereavement trajectory. Strengthening primary care involvement and discussion about end-of-life dialogue and post-loss follow-up may therefore significantly improve caregivers' experiences and grief resolution.

ID 1110- No One Left Behind in Remote Communities: Strengthening Caregiver Support through SDG-Aligned Online Primary Care Consultations

Chiaki MISHIMA, Akinori YAMABE

Jichi Medical University, Tochigi, Japon

Context: Family and professional caregivers in remote and geographically isolated communities often experience substantial emotional and informational burdens due to limited access to continuous primary care. These caregivers frequently navigate complex health issues on behalf of older adults while lacking timely medical guidance and psychological support. Such inequities highlight the need for scalable and person-centered approaches to caregiver support.

Methods: Using a mixed-methods design, this study focused primarily on caregivers who participated in regularly scheduled online health consultations. Quantitative surveys evaluated perceived clarity and empathy of communication, usefulness of medical advice, caregiver burden, stress levels, and trust in providers. Focus group interviews explored caregivers' lived experiences, unmet needs, and perceptions of how online communication influenced their emotional well-being and caregiving confidence.

Originality: Using a mixed-methods design, this study focused primarily on caregivers who participated in regularly scheduled online health consultations. Quantitative surveys evaluated perceived clarity and empathy of communication, usefulness of medical advice, care.

Lessons learned and future implication: Caregivers reported reduced anxiety, enhanced ability to make informed decisions, and improved confidence in managing daily care. Many emphasized the value of empathetic communication, noting that it alleviated their sense of isolation and provided valida.

Discussion: The study demonstrates that online consultations can effectively reduce caregiver burden while strengthening continuity of care. However, limitations include a small sample size, variability in caregivers' digital literacy, and dependence on stable technological infrastructure. Further research should assess long-term outcomes, explore culturally adaptable communication strategies, and examine integration into broader community-based primary care systems.

Conclusion: SDG-aligned online consultations contributed to greater equity, psychological well-being, and informational support for caregivers in remote communities. While challenges remain regarding scalability and technology access, this model offers a promising framework for enhancing caregiver-centered primary care in underserved populations.

Cervical Cancer Prevention

ID 2163- Digital Patient Support for HPV Prevention in Primary Care

Andreea Cristina MACOVEI, Rodica Sorina POP, Aida PUIA

"iuliu Haţieganu" University Of Medicine And Pharmacy-Cluj, Cluj-Napoca, Roumanie

Context: In XXX, HPV vaccination uptake remains low, despite cervical cancer continuing to represent a major public health problem. In everyday primary care practice, vaccine hesitancy and limited access to clear, trustworthy information are frequently encountered. Although digital education is

increasingly promoted, web-based interventions remain uncommon in XXX.

Objectives: The aim of this study was to assess whether a digitally delivered educational intervention implemented in primary care could improve patient knowledge, attitudes, and confidence regarding HPV vaccination. Also, the study explored subsequent vaccination uptake.

Methods: This ongoing educational initiative was carried out in one family medicine setting in XXX, with planned expansion to five additional practices before the WONCA conference. Online educational sessions focusing on HPV infection and vaccination were offered to 60 adult patients and parents registered in a single family medicine practice. The sessions were delivered with the involvement of a family medicine trainer and a resident, reflecting routine primary care practice. Knowledge and attitudes were assessed using standardized questionnaires administered before and after the sessions. Follow-up assessments after one and two months are planned to observe changes in attitudes and actual vaccination uptake.

Results: Paired analysis included 37 participants who completed both questionnaires, as not all participants completed all study stages. Following the intervention, attitudes towards HPV vaccination improved significantly. Perceived vaccine effectiveness increased, while concerns regarding serious adverse effects decreased ($p < 0.01$ for both). Adherence to family doctor recommendations also improved. Only 62% of participants completed all assessment stages. These results are preliminary, as data collection is ongoing.

Discussion: The findings suggest that digital education delivered within primary care may help address common concerns related to HPV vaccination. However, incomplete participation highlights practical challenges in maintaining patient follow-up in routine practice.

Conclusion: In the digital era, primary care has an important role and digital delivery may increase access to preventive education. This initiative suggests that teaching delivered through digital platforms can support patient-centered HPV prevention. This primary care–based digital intervention was associated with more favorable attitudes towards HPV vaccination. Despite being limited to a single practice and a modest sample size, the approach may be transferable to other primary care settings.

ID 2019- HPV literacy among women undergoing chemotherapy for breast cancer: preliminary findings from a cross-sectional study

Feride GULCULER [(1)] , Umut DOGAN [(1)], Umut GOK [(2)]

(1) 1, Izmir, Türkiye
(2) 2, Izmir, Türkiye

Context: 1. Izmir City Hospital,Department of Family Medicine 2. University of Health Sciences,Izmir City Hospital,Department of Family Medicine.

Objectives: The level of literacy regarding HPV plays an important role in participation in screening programs and the development of protective behaviors.The aim of this study is to evaluate the levels of literacy regarding HPV infection,cervical cancer screening,and the HPV vaccine in female patients undergoing chemotherapy for breast cancer.

Methods: This study is prospective,cross-sectional,and descriptive in nature and was conducted between 01/08/2025–01/09/2025,in the chemotherapy unit of a tertiary education and research hospital.Forty-eight female patients receiving chemotherapy for breast cancer were included in the study.Data were collected using a structured form that inquired about sociodemographic and clinical characteristics and the HPV Literacy Scale(HPV-LS) through face-to-face interviews.Statistical analyses were performed using the SPSS 25.0 program;chi-square test,one-way analysis of variance,and appropriate post-hoc tests were used for intergroup comparisons.The significance level was set at $p<0.05$.

Results: The mean age of participants was 53.2±9.4 years,64.6% were married,and 43.8% had completed primary school.The proportion of participants who had heard of HPV was 77.1%, and the proportion who reported having knowledge about HPV was 18.8%.The proportion of participants

who had received the HPV vaccine was 2.1%.The rate of those who had undergone HPV testing and Pap smears was 64.6%.HPV-LS scores were found to be higher among those who had undergone HPV testing and Pap smears(p=0.022 and p=0.014, respectively),and showed significant differences in terms of education level(p=0.003) and socioeconomic status(p=0.018);while they were found to be lower in individuals with chronic diseases(p=0.032).

Discussion: Findings indicate that HPV literacy is associated with screening behaviors and sociodemographic variables.The significant relationship between participation in screening tests and HPV-LS scores suggests that screening programs should be considered an effective tool for providing information.Differences based on education and socioeconomic status, however, point to inequalities in HPV literacy.These findings are consistent with international studies reporting higher HPV awareness among individuals with higher levels of education.

Conclusion: HPV literacy is inadequate among women receiving chemotherapy for breast cancer.The findings suggest that structured interventions to increase HPV awareness,screening counseling,and vaccine awareness in primary care settings should be a priority in health policies
Keywords:HPV,Cervical Cancer,HPV Vaccine

ID 1901- The relationship between women's cervical cancer risk status, risk perception, and their cervical cancer screenings

Makbule Neslişah TAN [(1)] , Hayal DEMIR [(2)], Azize Dilek GÜLDAL [(1)]

(1) Department Of Family Medicine, Dokuz Eylul University Faculty Of Medicine, Izmir, Türkiye
(2) Menemen Family Health Center, Izmir, Türkiye

Context: Cervical cancer screening methods such as the Pap smear and HPV test are easy to administer and are life-saving.

Objectives: In this study, the aim was to determine the relationship between women's cervical cancer risk status and risk perceptions and cervical cancer screening.

Methods: This cross-sectional study was conducted in April 2021 among 600 women aged 30 to 65 years who met the study criteria and were registered at a university family health centers. Data were collected using a “Data Collection Form” and “The Health Belief Model Scale for Cervical Cancer and the Pap Smear Test”. Participants were asked, "What do you think your risk of cervical cancer is?". Risk perception was measured using 'low,' 'medium,' and 'high' responses. A total risk score was calculated by assigning values to risky health behaviors and situations described in the literature. Statistical analyses included descriptive statistics, t-tests, ANOVA, and chi-square tests.

Results: Participants had a mean age of 43.6±10.0 years. Of those who did not undergo screening, 55.5% were aged 30–40 (p = 0.009). Most women (86.2%) knew about cervical cancer screening, and 71.2% had received it. The study found 72.3% perceived medium risk, 20% low, and 7.7% high risk of cervical cancer. Women with high risk perception were more likely to be screened (p = 0.009). Those with higher total risk scores (7.46±2.29) underwent screening more than those with lower scores (6.78±2.48; p = 0.002). No significant difference was found between total risk score and individual risk perception (p > 0.326). Subscale scores—Pap smear benefit/motivation, cancer importance, sensitivity, and health motivation—were higher in women who had Pap smears (34.09±5.84, 24.40±5.98, 8.26±2.42, 9.22±3.20; p = 0.000). Pap smear barriers were higher among unscreened women (41.23±9.65). High-risk perception was linked to higher scores for Pap smear benefit/motivation (36.04±4.20), cancer importance (27.63±5.79), sensitivity (10.20±2.64), and health motivation (10.21±3.22). Low-risk perception corresponded to higher Pap smear barrier scores (35.43±11.69).

Discussion: Consultancy services should be provided to help those with a low risk perception to accurately assess their risk.

Conclusion: To understand and assess the risk level of cervical cancer, there is a need to develop risk calculation models.

ID 1940- HPV vaccination coverage and motivators among polish future healthcare providers

Sylwia KAŁUCKA, Agnieszka GŁOWACKA

Medical University, Łódź, Pologne

Context: Background: HPV vaccination is a key preventive measure against HPV-related cancers, yet uptake among young adults in Poland remains low. Understanding the attitudes and barriers faced by future healthcare professionals is vital for improving coverage.

Objectives: Aim: To evaluate HPV vaccination coverage, attitudes, and determinants among medical, nursing, midwifery, and public health students, and identify factors influencing vaccination decisions.

Methods: A cross-sectional survey was conducted among 1,062 students at the Medical University of Lodz. Participants reported vaccination status, willingness to vaccinate, perceived barriers and motivators, and adverse events. Logistic regression analyses identified predictors of vaccination.

Results: Results: Overall, 20% of students had received the HPV vaccine, with the highest coverage among Midwifery students (26.8%) and the lowest among medical students (16.8%). Among unvaccinated students, willingness to vaccinate exceeded 60% in medical students but was below 40% in nursing students. Key barriers included cost and misconceptions about vaccination age limits; most students were too old to benefit from Poland's recent free vaccination program for 9–14-year-olds. Parental influence and university guidance were the main motivators, though formal recommendations were infrequent. In univariate analysis, marital status, having children, and prior sexual experience were associated with vaccination; in multivariate analysis, only marital status remained significant (OR = 2.58; 95% CI: 1.37–4.86; p = 0.004). Adverse events were reported by 45% of vaccinated students, mostly mild injection-site reactions; no vaccination discontinuations occurred.

Discussion: HPV vaccine uptake among future healthcare professionals in Poland is low despite positive attitudes, highlighting the need for financial support.

Conclusion: Conclusions: HPV vaccine uptake among future healthcare professionals in Poland is low despite generally positive attitudes. Targeted educational programs and financial support are needed to reduce barriers and improve vaccination rates, ultimately strengthening preventive healthcare.

ID 555- Self-sampling for HPV-test: primary care providers' perception. Qualitative study

Léa SCHLECK

Université De Lorraine, Vandoeuvre Les Nancy, France

Context: Despite a national organized screening program since 2018, the incidence of cervical cancer screening rates too low in France. In 2019, national recommendations introduced the use of self sampling for HPV-testing as an alternative to provider-performed screening for women whose screening is not up to date. However, its use appears to be marginal. Numerous studies have examined women's perspectives as well as the technical and budgetary aspects of self-sampling for HPV testing. To date, few studies have examined the opinions of the various prescribers.

Objectives: The objective of this study is to investigate the perception of self-sampling for HPV testing among primary care providers involved in cervical cancer screening in Lorraine (France).

Methods: Qualitative analysis using semi-structured individual interviews with primary care providers involved in the cervical cancer screening strategy in Lorraine (GPs, midwives, and gynecologists).

Results: A total of 13 participants were recruited for the study between July 2024 and March 2025, including 6 general practitioners, 4 midwives, and 3 gynecologists. Most participants reported a positive view of the self sampling for HPV-testing and cited it as a tool to reach some women who had dropped out of screening. However, this test was described it as insufficient and useless in their practice y gynecologists and midwives.

Discussion: The benefits of self-sampling for HPV-test, already highlighted in the French and internationale literature for patients who have limited access to healthcare or living in rural areas, or having experienced gynecological or sexual trauma. An interesting tension emerged between the potential benefits of such a test for women's empowerment and respect for their privacy, alongside concerns about healthcare professionals losing expertise.

Conclusion: Self-sampling for HPV-testing is a promising tool for improving cervical cancer screening by increasing adherence to screening and women's autonomy. However, its widespread adoption requires better promotion and appropriate support to ensure informed use that complements comprehensive medical care.

Corresponding author: Léa Schleck, lea.schleck@univ-lorraine.fr

ID 351- Retrospective study of CERVICAM (cervical cancer prevention)´s adherence in 3 centers of Madrid region during 2023.

Esperanza TENREIRO VILLAR [(1)] , Roberto COLMENERO ROLLINSON [(1)], Maria TORRADO BONET [(2)], Ana GARCIA DE FRANCISCO [(2)], Natalia ESCAURIAZA ISPIZUA [(2)], Isabel JIMENO SANZ [(2)]

(1) H.universitario Fjd, Madrid, Espagne
(2) Sermas, Madrid, Espagne

Context: The cervical cancer prevalence in Spains is one of the lowest in Europe but in 2016-2020 was increase by a 6%, in relation with VPH (papiloma human virus) which is present in the 99,7%. Been a silence cancer until advance stages it´s important to have a screening method available. In Madrid region it´s call CERVICAM.

Objectives: Determinate adherence to Cervical cancer screening by cervical citology in women between 25 and 65 years old.

Methods: Restrospective and descritive observational study that include every women patients between 25 and 65 years old in the 3 medical quota and that had indication of cervical cancer screening. Principle variable: screening adherence acording to CERVICAM criterias: - Women between 25 and 35 years old must have a cervical citology each 3 years - Women between 35 amd 65 years old must have a negative VPH-AR or cervical citology in the last 3 years. Secundary variables: citology results, VPH results or place where citology has been taken.

Results: 991 patients were include in the study but 50 were exclude because of the ausence os screening indication obtaining a 55.6% adherence to screening. The citology results were negative in the 95% but VPH was determinate only un 10.3% of patients. According to the place were the citology were made 48.5% took place in CERVICAM and 35.2% in the private health care. The study has shown stadistical difference according to socioeconomic level whith a decrease of adherence from 72.3% to 44.1% between both neighborhoods.

Discussion: A 55.6% adherence to CERVICAM screening its insufficient to reduce cervical cancer mortality, but it can be related to the lack of information in the general population. Recently the Madrid goverment has modify the CERVICAM protocole to include the SMS or email contact o email which. During our study it has been made in some cases telephone contact to inform the patient of the protocole which increase the adherence in 2024. It could be interesting for forward studies to compare both porcentages.

Conclusion: Telephone contact and information of screening as daily medical practice will be necesary to increase cervical cancer screening adherence and by that reduce its morbimortality

Children's development

ID 1928- Adverse Childhood Events: Implications for Primary Care Providers

Jane RICKS, Dan RICKS

Independant Researcher, Salt Lake City, États-Unis

Context: Adverse Childhood Experiences (ACEs) are stresses that children may suffer while growing up. In Europe 4 in 10 adults have suffered ACEs as children and the health burden is estimated at 24.6 million Disability-Adjusted Life Years (DALYs) in Europe alone.The Center for Disease Control (CDC), the World Health Organization (WHO), and others have put out guidelines for prevention and

treatment of ACEs in order to decrease the lifetime morbidity from these trauma.

Objectives: 1) To review the important scientific literature on ACEs. 2) To identify simple interventions that can be implemented in the primary care setting to help patients with disability due to ACEs.

Methods: Books, journal articles, lay material, and internet searches were done to collate the important principles of ACEs and treatment as pertains to primary care providers (PCPs).

Results: WHO strategies include 1) policy and legislation, 2) strengthening families, 3) education and life skills, 4) support services, and 5) muti-component programs. Education and life skills have been shown to be particularly helpful. One university, Penn State, USA has over 20 years' experience in teaching resilience to at-risk youth, showing success in helping youth cope with stress and decrease anxiety.

Discussion: ACE's and its disabling effects can be diminished in our society. Both primary prevention and secondary prevention are effective in decreasing ACEs and its associated disability. Primary prevention can be achieved by enhancing social services to families and parents. Secondary prevention can be achieved by teaching resiliency to young people.

Conclusion: ACEs and the disability of ACEs are staggeringly high and show no signs of retreat. PCPs who interact with patients on a regular basis are in an ideal position to identify and refer patients who suffer from ACEs for appropriate mitigating treatment. Together as first line responders we can help our patients who have suffered trauma, while helping create programs to prevent future generations from the same struggles.

ID 954- ScreenCare: The impact of screen use on behavior, sleep and weight, in children aged 5 to 10 years old.

Inês RODRIGUES, Ana ANA VERISSIMO, Marta MARTA AGUIAR

None, Porto, Portugal

Context: Screen exposure has become increasingly pervasive in childhood, with growing evidence linking excessive use to behavioral difficulties, sleep disturbances, and adverse physical health outcomes.

Objectives: To assess, in children aged 5 to 10 years, the relationship between daily screen exposure and indicators of behavior, sleep quality, and body weight.

Methods: A cross-sectional observational study is being conducted from september 2025- december 2026. The sample expects to include up to 200 children aged 5–10 years, recruited through elementary schools. Parents or primary caregivers complete an anonymous questionnaire including sociodemographic data, average daily screen time (weekdays and weekends), the Strengths and Difficulties Questionnaire (SDQ), an adapted Sleep Quality Scale, and parent-reported weight and height. Descriptive statistics were performed, and correlations were calculated between screen time, behavior, sleep variables, and body weight.

Results: The results are preliminary. To date, 52 children have been included in the analysis. A preliminary index of screen-related behaviors was constructed (10 Likert-type items, $\alpha = 0.90$), along with a preliminary index of sleep problems (25 items, $\alpha = 0.84$). Among the 39 children with available weight data, no significant association was observed between weight and the behavior index (Spearman $\rho = 0.02$; $p = 0.91$), and only a trend toward a negative association was noted between weight and sleep problems ($\rho = -0.31$; $p = 0.056$). In contrast, a moderate and statistically significant positive correlation was found between sleep problems and screen-related behaviors in the current sample ($\rho = 0.46$; $p < 0.001$), indicating that children showing greater sleep disturbance also tend to present more dysregulated screen-related behaviors. Further results will be updated as data collection progresses.

Discussion: These preliminary findings reinforce existing evidence linking excessive screen time to

behavioral and sleep dysregulation. The correlation with BMI is modest, further responses are needed to draw deeper conclusions.

Conclusion: Provisional results appear to indicate that screen time among children aged 5–10 years is above recommended levels and is associated with behavioral difficulties, disrupted sleep patterns, and a tendency toward higher BMI. Once finished this study aims to highlight the need for ongoing clinical monitoring and parental guidance on healthy technology use during childhood.

ID 1217- Social and environmental determinants of language delay among children aged 12–42 months: evidence from a nationally representative survey

Betzabé TELLO [(1)] , Iván DUEÑAS-ESPÍN [(1)], Philippe BELMONT [(2)], Virginia MARCHMAN [(3)], Marta RUBIO-CODINA [(4)]

(1) Pontificia Universidad Católica Del Ecuador, Quito, Équateur
(2) Centro De Investigación Para La Salud En América Latina (ciseal), Quito, Équateur
(3) Stanford University, California, États-Unis
(4) Inter-American Development Bank, Washington, États-Unis

Context: Early language skills are critical for cognitive and socioemotional development and are routinely monitored in primary care. The COVID-19 pandemic exacerbated vulnerabilities in early childhood, with recent estimates from a middle-income Latin American country indicating that developmental delay has risen to approximately 28%. Despite this alarming increase, there is limited population-based evidence identifying the determinants of language delay in young children in the region. This study aims to address this evidence gap.

Objectives: To estimate the prevalence of language delay among children aged 12–42 months and to identify structural, underlying, and proximal determinants associated with delay using nationally representative data from a 2018 health and nutrition survey.

Methods: A cross-sectional analytical design was applied to data from 8,446 children. Language development was assessed using caregiver-reported items adapted from the MacArthur–Bates Communicative Development Inventories. Explanatory variables followed the UNICEF early childhood development framework. Analyses included survey-weighted descriptive statistics, design-adjusted bivariate tests, and multivariable logistic regression models. Sensitivity analyses and collinearity diagnostics ensured robustness.

Results: Language delay affected 14.5% of children before the pandemic. Structural inequities were evident: delay was more frequent among children living in poverty, in rural settings, and in households with inadequate sanitation. Underlying determinants included lower maternal education and limited participation in early childhood programs. Proximal determinants showed the strongest associations. Lower cognitive stimulation (HOME score below the median), fewer types of toys, reduced access to children's books, and less engagement in interactive activities (reading, storytelling, singing) were all linked to significantly higher odds of delay. Each additional hour of daily screen exposure increased odds of delay (aOR ~1.07). Male sex and older child age were consistent predictors. Effects were more pronounced among children experiencing stunting.

Discussion: Findings reveal deep socioeconomic and environmental gradients in early language development. The sharp post-pandemic increase in developmental delay (28%) reinforces the urgency of strengthening early identification and caregiver-support strategies within primary care.

Conclusion: Language delay is a substantial and socially patterned public health challenge in a middle-income Latin American country. Integrating structured developmental monitoring and targeted family support into primary care could help mitigate widening post-pandemic developmental inequalities.

ID 1214- Expressive vocabulary norms for children aged 12–42 months: population-based percentiles for early detection in primary care

Betzabé TELLO [(1)] , Iván DUEÑAS-ESPÍN [(1)], Philippe BELMONT [(2)], Virginia MARCHMAN [(3)], Marta RUBIO-CODINA [(4)]

(1) Pontificia Universidad Católica Del Ecuador, Quito, Équateur
(2) Centro De Investigación Para La Salud En América Latina (ciseal), Quito, Équateur
(3) Stanford University, California, États-Unis
(4) Inter-American Development Bank, Washington, États-Unis

Context: Early expressive vocabulary is a key indicator of child development and is routinely monitored in primary care. However, many middle-income settings lack population-based normative references to detect children at risk of language delay. No national expressive vocabulary norms previously existed for children aged 12–42 months in a middle-income Latin American country.

Objectives: To establish age-specific expressive vocabulary percentiles using MacArthur-Bates Communicative Development Inventories (MB-CDI) Short Forms and to estimate the prevalence of low language development in children aged 12–42 months in a middle-income Latin American country.

Methods: This study analyzed data from a nationally representative health and nutrition survey conducted in 2018, including 4,652 children aged 12–42 months. Expressive vocabulary was assessed using three 50-item MB-CDI Short Forms across three age groups (12–18, 19–30, 31–42 months). Children with conditions potentially affecting neurodevelopment were excluded from norm construction. Generalized Additive Models for Location, Scale, and Shape (GAMLSS) were used to generate smooth percentile curves (P10, P25, P50, P75, P90). Demographic correlates of low vocabulary, defined as scoring below the 10th percentile, were examined.

Results: Vocabulary increased steadily with age in all percentiles. Median expressive vocabulary rose from 24 to 33 words (12–18 months), 12 to 32 words (19–30 months), and 18 to 30 words (31–42 months). Low language development affected 14.6% of children. Girls showed slightly higher scores in younger groups, though differences were not significant at older ages. Lower maternal education was strongly associated with higher prevalence of low vocabulary. Ceiling effects were observed at younger ages and were addressed using Beta-inflated models.

Discussion: This study provides the first population-based expressive vocabulary norms for young children in a middle-income Latin American country. The results highlight meaningful developmental variability and sociodemographic disparities relevant for early detection in primary care.

Conclusion: MB-CDI Short Forms, combined with percentile-based norms, offer a feasible and culturally appropriate tool for identifying children at risk of language delay in primary care settings in a middle-income Latin American country. Incorporating expressive vocabulary monitoring into routine child health evaluations can support early intervention and reduce developmental inequities.

ID 964- The unexpected impact of childcare arrangements on exposure to touchscreens in children under 3 years of age.

Fanny SERMAN, Charles CAUET, Nassir MESSAADI, Thibaut JULIEN, Quentin BOYEZ, Sabine BAYEN, Teddy RICHEBÉ, Matthieu CALAFIORE

Department Of General Medicine, University Of Lille, Lille, France

Context: Given the ubiquity of touch screens and applications, the American Academy of Pediatrics revised its recommendations for the use of interactive screens in 2016, advising against their use before 18 months of age (compared to 24 months previously).

Objectives: The aim of this study was to describe touch screen exposure and associated factors in XXX children aged 0-36 months.

Methods: Cross-sectional descriptive epidemiological study were conducted between August 2017 and August 2018. Questionnaires were distributed to parents of children aged 0-36 months who consulted general practitioners in the XXX region. Data were collected on exposure to touch screens, socio-demographic characteristics and

parental feelings. Ethical approval and data protection compliance were secured, and informed consent was obtained.

Results: 44 investigators were recruited and 395 questionnaires were collected. Three quarters of the children were exposed to a touch screen, mainly passively and accompanied. The child's age was correlated with greater exposure in terms of frequency ($p = 0.001$) and duration ($p = 0.006$). Other factors associated with more frequent exposure were grandparent care ($p = 0.03$), mother's lack of employment ($p = 0.049$) and parents' positive perception of screens ($p < 0.001$). These risk factors remained significant on multivariate analysis. There was no significant association between exposure to touch screens and child's gender, parents' age or parents' socio-professional categories.

Discussion: This study was the first in XXX to examine the link between childcare arrangements and children's screen exposure. It achieved its intended statistical power and benefited from a multicentre design. However, some age and socio-professional groups were under-represented, and the robustness of the findings was limited by several biases, including selection, recall, social desirability, comprehension and geographical misclassification. The findings generally aligned with the international literature, but they also highlighted a novel association: higher touchscreen exposure among children cared for by grandparents.

Conclusion: The high exposure to touch screens among young children in the XXX was consistent with the existing literature. Childcare by grandparents emerged as a significant factor for increased exposure. These findings highlight the importance of informing parents and grandparents about recommendations for screen use, with general practitioners playing a key role in prevention.

Corresponding author: Fanny Serman, fanny.serman@univ-lille.fr

ID 853- e-KID - Validation of a Screening Tool for Screen Overexposure in Children Aged 0 to 18 in Primary Care

Juliette CHAMBE [(1)] , Maurine MOERCKEL [(1)], Elodie SIEBERT [(2)], Anne BERTHOU [(1)]

(1) Department Of General Practice, Strasbourg University, Strasbourg, France
(2) Department Of General Practice, Nancy University, Nancy, France

Context: Excessive screen time is associated with developmental, behavioral, and health risks in children. Despite growing concern, no validated tool currently exists in any language to identify screen overexposure in routine clinical practice.

Objectives: To validate a novel screening tool for detecting screen overexposure among children and adolescents aged 0 to 18 during primary care consultations. The primary outcome was the tool's diagnostic accuracy in identifying screen overexposure, defined by physicians' clinical assessment. Secondary outcomes included internal and external validity, user acceptability, and identification of risk factors.

Methods: This was a prospective, multicenter, cross-sectional validation study conducted between December 2023 and March 2024. A total of 439 children aged 0 to 18 years were recruited by 74 primary care physicians and 3 child health institutions in France. The tool was originally developed during a previous thesis through a systematic literature review and Delphi consensus process.

Results: A threshold score of 6 out of 21 was identified as the optimal cutoff for screen overexposure, yielding a sensitivity of 96% and specificity of 74.1%. The tool's total score correlated strongly with clinician assessment (AUC = 0.925; 95% CI, 0.899–0.951; $p < .001$). Age-specific thresholds were established, and weighted scoring was proposed for each age group. Physicians rated the tool as easy to use, well integrated into clinical practice, and effective in initiating discussions with families. Known risk and protective factors (e.g., maternal education, screen rules, outdoor space) were confirmed.

Discussion: In the absence of a gold standard, the score was created by expert consensus. The combination of the two sub-scores, usage (where, when, how much, how?) and warning signs, makes

it possible to refine the identification of at-risk situations.

Conclusion: This study validates the first screening tool for screen overexposure in children, designed for use in everyday primary care settings. The tool meets a widely recognized clinical need and provides a practical method to support prevention, early detection, and family education in pediatric consultations.

Corresponding author: Maurine Moerckel, moerckel.maurine@gmail.com

ID 68- Screening Tools for Attention-Deficit/Hyperactivity Disorder in Children and Adolescents in General Practice: A Literature Review

Dina GANDOUR

Université Paris Cité, Paris, France

Context: Attention-deficit/hyperactivity disorder (ADHD) affects 3–5% of children in XXX. Diagnosis is frequently delayed due to limited access to specialists and variability in clinical practices. As the first point of contact for families, general practitioners (GPs) play a pivotal role in early detection but often lack screening tools adapted to the realities of primary care.

Objectives: To identify, evaluate, and compare the diagnostic performance of ADHD screening tools for children and adolescents in the context of family medecine.

Methods: A narrative literature review was conducted using a PRISMA-inspired approach. Searches of PubMed, Embase, the Cochrane Library, and Google Scholar (January 2015 – May 2025) identified studies involving children aged 6–18 years that evaluated ADHD screening or diagnostic tools applicable to general practice. Out of 166 references, 10 articles were retained after independent dual screening and critical appraisal.

Results: Three categories of instruments were identified. DSM-based scales (Conners, Vanderbilt, SNAP-IV, ADHD-RS) demonstrated good sensitivity (70–85%) but variable specificity (60–80%), which improved when combining reports from multiple informants.Broadband scales (SWAN, CBCL, CABI) assess both symptom severity and comorbidities; notably, the CABI offers free access and strong predictive validity (AUC ≈ 0.93). Short questionnaires (PSC, SDQ) are practical for rapid pre-screening in general practice but show limited specificity (< 60%) and should not be used in isolation.

Discussion: No single tool provides sufficiently reliable screening on its own. The most effective approach in primary care is a two-step strategy: (1) an initial pre-screening with a brief questionnaire (PSC or ASQ), followed by (2) a concise DSM-based scale (SNAP-IV or ADHD-RS) to quantify symptoms. A broadband scale (such as the CABI or CBCL) can be added when comorbidities are suspected. The general practitioner's role is to identify children requiring specialist assessment and ensure follow-up within a structured care pathway, which could include a dedicated, coded consultation to synthesize clinical and screening data before referral.

Conclusion: Standardized rating scales complement clinical evaluation and support earlier detection of ADHD in primary care. Future research should aim to develop validated, time-efficient tools tailored to general practice and to promote the use of accessible digital formats that facilitate their routine implementation.

Chronic disease management

ID 1614- Health Literacy, Socioeconomic Barriers, and Chronic Disease Management Among Older Adults in Prishtina, Kosovo

Naim JERLIU [(1)] , Naud VOLDERS [(2)], Pranvera KRASNIQI [(3)], Arlinda JETISHI [(3)]

(1) Faculty Of Medicine, University Of Prishtina, Prishtina, Kosovo
(2) Faculty Of Health, Medicine & Life Sciences, Maastricht University, Maastricht, Pays-Bas
(3) National Institute Of Public Health Of Kosovo, Prishtina, Kosovo

Context: Older adults in Kosovo face multilayered socioeconomic challenges that shape chronic disease management, yet the interaction between health literacy, economic constraints, and self-management remains insufficiently documented.

Objectives: To examine the relationship between health literacy, socioeconomic barriers, and chronic disease self-management among older adults in Prishtina, Kosovo.

Methods: A mixed-methods survey was conducted among 89 older adults in Prishtina. Health literacy was assessed using the HLS-EU-Q16, chronic disease self-management using the SC-CII, and open-ended questions explored participants' perceived needs and barriers.

Results: Although 47.8% of participants demonstrated adequate health literacy, socioeconomic constraints dominated health-related experiences. The most frequently reported unmet needs were cost-free medication (34%) and financial assistance (28%). Many participants linked their ability to manage chronic conditions directly to pension adequacy and out-of-pocket healthcare costs. Regression analyses indicated that, even after controlling for health literacy, individuals with "other" chronic conditions—often requiring expensive or specialised care—had significantly lower self-management scores (B = −7.25, p = 0.038). Qualitative findings further revealed that economic stress undermines long-term disease management, often outweighing knowledge or motivation.

Discussion: The findings suggest that the potential benefits of health literacy are constrained when older adults face persistent financial hardship, highlighting the limits of individual-level interventions in the absence of structural support. Weak social protection mechanisms, high out-of-pocket payments, and fragmented care pathways within the healthcare system further exacerbate inequalities in chronic disease management. In this context, health literacy initiatives must be embedded within a responsive healthcare system that ensures continuity of care, equitable access to services, adequate consultation time, and coordinated support across health and social sectors.

Conclusion: Health literacy alone is insufficient to ensure effective chronic disease self-management when socioeconomic barriers are substantial. Policymakers should prioritize strengthening the healthcare system through improved financial protection, affordable medication coverage, integrated primary care models, and age-sensitive service delivery. Aligning health literacy strategies with broader health and social policies is essential to create enabling environments for self-management, reduce inequities, and promote healthy, dignified ageing in Kosovo.

ID 1197- A methodological framework to ascertain evidence für monitoring procedures in people with chronic conditions (ChroMo framework)

Veronika VAN DER WARDT [(1)] , Carolin GONSCHOREK [(1)], Lisette WARKENTIN [(2)], Julia HEISIG [(1)], Felix WERNER [(2)], Victoria KOSCHEMANN [(2)], Laura RINK [(2)], Thomas KÜHLEIN [(2)], Annika VINIOL [(1)]

(1) University Of Marburg, Marburg, Allemagne
(2) Uniklinikum Erlangen, Erlangen, Allemagne

Context: In people with chronic conditions, monitoring is an important part of their healthcare. However, many monitoring procedures have developed historically and only limited evidence is available. This project created a framework to set out requirements for the development or evaluation of monitoring procedures.

Objectives: The aim of the framework is to guide the process of developing or evaluating evidence for monitoring procedures.

Methods: The framework was based on a scoping review that examined the evidence methods used to evaluate monitoring. The results were used to develop an initial draft, which was then presented at an international expert meeting. The feedback

contributed to further develop the framework. The next draft was then sent to all experts for comments. The process was repeated in two further rounds.

Results: Monitoring is only useful if four conditions are met: (1) clinically significant findings with a negative impact on disease-specific, patient-relevant outcomes occur over time; (2) treatment or preventive measures are available to address these clinically relevant findings; (3) valid, acceptable and affordable tests are available to detect these changes; (4) potential benefits and harms of the monitoring procedures have been considered and benefits outweigh harms. A step-by-step approach will then be used to obtain evidence for the individual components of a monitoring routine. This includes selection of target group and patient-relevant outcomes, selecting predictors with strong associations with these outcomes, determining appropriate treatment actions following monitoring results, selecting high-quality tests and defining target ranges, determination of further diagnostic actions, deciding monitoring intervals, and defining the best suited actor or setting for the completion of monitoring procedures. Patients with lived experience should be included in all steps of the process. A checklist was developed to guide the process.

Discussion: The framework provides a structured approach and can be used either to develop guideline recommendations or studies that evaluate monitoring routines. The stepwise process is guided by principles of patient involvement, patient-centred healthcare and scientific research. In a next step, the framework should be tested for different chronic conditions including simple and complex monitoring procedures.

Conclusion: The ChroMo framework can support the development of guideline recommendations for monitoring procedures.

ID 904- Medication Adherence in Chronic Disease: Determinants from a Prescription Renewal Outpatient Setting

Sümeyra GÜRGEN

Ankara Sincan Training And Research Hospital, Family Medicine Clinic, Ankara, Türkiye

Context: Medication adherence is essential for effective chronic disease management in primary care. Behavioral factors, patient-reported barriers, and treatment complexity strongly influence adherence. Evidence from chronic disease follow-up outpatient clinics, which typically serve older and multimorbid patients, is limited. This study presents preliminary findings from an ongoing investigation assessing adherence and related factors in this setting.

Objectives: This study aims to measure medication adherence among adults attending a chronic disease follow-up outpatient clinic, identify patient-reported difficulties affecting adherence, and examine demographic, clinical, and behavioral factors associated with adherence.

Methods: This ongoing cross-sectional study includes adults using long-term medications for chronic diseases. Data are collected through face-to-face interviews using a structured questionnaire assessing sociodemographic characteristics, chronic conditions, medication burden, digital reminder tool use, alternative medicine practices, and patient-reported difficulties. Medication adherence is measured with the 12-item Medication Adherence Questionnaire (score range 12–48). Descriptive statistics, chi-square tests, t-tests, and correlation analyses were conducted. Recruitment is ongoing; this abstract reports interim findings from 109 participants.

Results: The mean age was 57.6±14.1 years; 53.2% were female and 38.5% were aged ≥65 years. Hypertension (66.1%) and diabetes (51.4%) were the most common chronic conditions. The mean adherence score was 39.7±6.2; 75.2% showed high adherence and 24.8% moderate adherence. Despite high adherence, 55% reported at least one medication-related difficulty, most commonly forgetfulness (25.7%) and financial concerns (17.4%). Although nearly all participants owned a smartphone (96.3%), only 8.3% used digital reminders. Adherence did not differ significantly by age, sex, education level, or medication count. Participants with COPD and those reporting difficulties showed slightly lower adherence scores, though differences were not statistically significant.

Discussion: Interim findings show high adherence despite frequent patient-reported difficulties. Forgetfulness and financial concerns suggest vulnerability even among highly adherent patients. Extremely low use of reminder tools, despite universal smartphone access, highlights a feasible target for intervention. Continued recruitment and multivariable analyses will help identify subgroups at greater risk of reduced adherence.

Conclusion: This ongoing study indicates that patients generally maintain high adherence yet face modifiable challenges. Simple supportive strategies, such as digital reminders, may help address common barriers. Final results will inform targeted adherence-support interventions in primary care.

Corresponding author: Sümeyra Gürgen, sdemir54@yahoo.com

ID 724- Implementing the Patient Experience for Disease Management Scale (PEDMS) in Primary Care: A Framework for Measurement and Quality Improvement

Nasser ALQAHTANI

Associated Professor In Department Of Family And Community Medicine, College Of Medicine, Najran University Najran , Saudi Arabia, Najran, Arabie Saoudite

Context: Enhancing patient-centred care requires robust mechanisms to capture the patient perspective on disease management. The validated Patient Experience for Disease Management Scale (PEDMS) provides a multi-dimensional assessment, but its utility in clinical practice is contingent upon a clear implementation and interpretation framework.

Objectives: This study presents a structured methodology for the clinical application of the PEDMS, demonstrating how its domain-specific scores can be utilized by primary care teams to identify discrete areas of strength and deficiency in care processes, thereby facilitating targeted quality improvement and reinforcing the therapeutic partnership.

Methods: The PEDMS is 38-item instrument encompassing eight domains: Reassurance and Explanation; Advice and Counselling; Prescribing; Red Flags and Referral; Investigation; Observation and Follow-up; Prevention and Promotion; and Patient's Wants, Needs, and Satisfaction. Respondents indicate their agreement on a five-point Likert scale. We delineate a systematic protocol for its application: (1) administration following clinical consultations, (2) calculation of mean scores (range 1-5) for each domain, and (3) analytical interpretation of scores to guide service enhancement. The psychometric integrity of this structure (CFI=0.965, RMSEA=0.067, Cronbach's α=0.878) underpins its reliability for this purpose.

Results: Application of the PEDMS yields a detailed profile of patient experience across the core domains of disease management. Domain scores facilitate immediate analysis: elevated scores (approaching 5) signify clinical strengths, while attenuated scores (approaching 1) pinpoint specific care delivery shortcomings. For instance, a high score in "Prescribing" concurrent with a low score in "Advice and Counselling" objectively identifies effective medication management alongside an unmet need for behavioural support, transforming subjective feedback into actionable intelligence.

Discussion: The PEDMS offers a structured approach to convert patient feedback into actionable strategies for clinical improvement. By moving beyond generic satisfaction metrics, it enables precise interventions that enhance the clinician-patient relationship. The tool highlights disparities in care experiences, promoting equity, and equips practitioners with data to advocate for meaningful changes aligned with patient priorities.

Conclusion: The PEDMS, alongside this implementation framework, is essential for advancing patient-centered care in primary settings. Its systematic use allows clinicians to efficiently identify and address gaps in disease management, contributing to more responsive and equitable healthcare systems.

ID 717- Rheumatoid Arthritis Follow-Up in Primary Care: Identifying Potential Barriers to Reduce Morbidity

Aneeq SHAIKH [1] , Venkatram NAVANEETHA [2], Mayukh BHATTACHARYYA [2]

(1) Queen Mary University Of London, London, Royaume-Uni
(2) Sangam Surgery, London, Royaume-Uni

Context: Rheumatoid arthritis (RA) is a major cause of long-term disability and reduced quality of life. While rheumatology services deliver specialist management, primary care plays a vital role in continuity, patient-centred follow-up, and long-term disease monitoring. NICE provides guidelines on a comprehensive annual review, including an assessment of functional ability, comorbidity risk, and complications. General practitioners (GPs) are well-equipped to deliver personalised care by addressing the patient's unique needs, concerns, and preferences. By engaging in patient education and shared decision-making, patients are empowered to take an active role in managing their own health. Additionally, the GP's holistic approach facilitates access to social care, caregivers, and council services – addressing wider emotional and social determinants of health.

Objectives: This audit reviews the existing clinical practice for RA annual reviews compared to the NICE guidelines. It particularly focuses on identifying opportunities to enhance medication adherence, comorbidity detection, and holistic follow-up.

Methods: Forty-seven patients were randomly reviewed for documentation of annual RA monitoring, comorbidity screening, and complications. Functional ability was assessed using a Health Assessment Questionnaire (HAQ), which was completed by 24 patients over the telephone.

Results: Only 5 patients had a coded annual RA review. CVD risk screening was consistent; however, osteoporosis and depression screening were under-recorded. Only 15% of patients underwent all three risk assessments. The mean HAQ score was 2, indicating moderate functional disability. Approximately 10% of patients had no contact with the practice despite repeated outreach.

Discussion: This audit highlights multiple challenges specific to primary care. A high workload, competing long-term conditions, and tight time constraints limit the depth of review, reducing opportunities for thorough, patient-centred follow-up. Non-attendance further restricts the clinician's ability to identify deterioration early. Addressing health literacy and patient education is crucial in combating this issue. The HAQ revealed functional decline that was not clear in routine consultations. This highlights the value of structured assessments in unmasking unmet needs. These, however, are time-consuming, exaggerating the time bottleneck that GPs already face.

Conclusion: Delivering holistic care through better patient education, improved comorbidity screening and technology implementation through pre-appointment digital HAQs, will vastly improve RA follow-up in primary care.

ID 105- The effect of medication class and inhaler device on adherence to inhalers in COPD patients

Michal SHANI [1] , Sophia EILAT-TSANANI [2], Doron COMANESHTER [3], Michael SEGEL [1]

(1) Tel Aviv University, Tel Aviv, Israël
(2) Bar Ilan University, Safed, Israël
(3) Clalit Health Services, Tel Aviv, Israël

Context: Inhalers containing bronchodilators and corticosteroids are the cornerstone of COPD pharmacotherapy. Adherence to prescribed medication is critical to successful management.

Objectives: We studied inhaler adherence in a large cohort of COPD patients in Israel, to assess the effect of specific inhaler devices and medications on adherence.

Methods: We performed a retrospective cohort study in Clalit Health Service (CHS), an HMO serving >50% of the population of Israel. CHS members aged 40-80 years with a diagnosis of COPD, who filled ≥1 prescription/year 2017-2019 (regular users) for at least one inhaler containing long-acting beta-adrenergics (LABA), long-acting anti-muscarinics (LAMA) and/or inhaled corticosteroids (ICS), were included. Filled monthly prescriptions were used as a proxy for actual medication use. The primary endpoint was the proportion of adherent users (purchase of ≥7 inhalers/yr in 2018).

Results: 20,413 COPD patients (age 68.4±7.1 yrs. 58% men, 87% ever smokers) were identified. Of 11,422 regular inhaler purchasers (56% of total), only 6,771 (59%) were adherent. Increasing age, male gender, better socio-economic status and smoking history were significant predictors of good adherence. Good adherence was more common for inhalers including LAMA. There were significant differences in adherence between inhaler devices. Adherence to once-daily inhalers appeared to be better than twice daily inhalers. Patients with good adherence were more likely to experience exacerbations, to be hospitalized and to die.

Discussion: 45% of the total COPD patients included in the study did not receive regular long-acting inhaler therapy. This is worrisome and suggests a need for better care for COPD patients.

Conclusion: Adherence to inhalers in COPD patients was associated with the drug class, inhaler device, and recommended frequency of use. Adherence was associated with worse outcomes, suggesting sicker patients are more adherent/

ID 74- Model of Care for Chronic Patients in Primary Health Care: An Integrated Perspective

Cristina ROVIRA MONTILLA, Elisabet DESCALS SINGLA, Sara RODOREDA NOGUEROLA, Ana Maria ANDRES LORCA

Institut Català De La Salut, Barcelona, Espagne

Context: As part of the transformation of the healthcare system, XXX has developed a new model of care for people with chronic conditions through the Planificat programme, a pioneering initiative within the field of primary health care. Progressively implemented since 2022 in 283 Primary Care Centres, the programme aims to improve health outcomes and enhance the teams' ability to address complex cases, using a methodology grounded in scientific evidence and adapted to the specific characteristics of each territory.

Methods: Planificat promotes a paradigm shift in the management of chronic conditions, focusing on equity, proactivity, and planning. Despite territorial inequalities in terms of resources and organisation, its inherent flexibility and adaptability have greatly facilitated its implementation, allowing each team the freedom to adjust the model to its local reality

Originality: The programme is distinguished by its comprehensive and innovative approach, integrating clinical, technological, and organisational interventions. It includes proactive patient management through digital tools, the systematic use of data to support clinic.

Lessons learned and future implication: The experience has highlighted the importance of clinical leadership, multidisciplinary collaboration, and professional cohesion. The active engagement of teams and their ability to adapt to available resources have been decisive factors in the success

Discussion: The results obtained show improvements in the identification and follow-up of people with chronic diseases, in performing annual check-ups, in the management of risk factors, and in patient satisfaction. Nonetheless, certain challenges remain, such as ensuring the sustainability of the model, consolidating a culture of change, achieving territorial equity in access, and strengthening coordination between different levels of care

Conclusion: Planificat represents a strategic commitment to reinforcing primary care as the backbone of the healthcare system. Its originality, impact, and adaptability position it as a benchmark for future health policies, contributing to more efficient, equitable, and person-centred care. The current challenge lies in guaranteeing its scalability and sustainability, ensuring its full integration within XXX overall chronic care strategy.

Context: Early detection of cardiovascular–kidney–metabolic (CKM) syndrome relies on detecting metabolic, renal, and cardiac abnormalities before irreversible organ damage. Biomarkers such as estimated glomerular filtration rate (eGFR), albumin-to-creatinine ratio (ACR), and N-terminal-pro-B-type natriuretic peptide (NT-proBNP) are central to this process, yet their routine use appears limited. This study examines the implementation of renal and cardiac biomarkers in Lithuania.

Objectives: Individuals with advanced CKM stages have a substantially increased risk of mortality and reduced life expectancy [1-2]. Given the high prevalence and severe consequences of CKM, reliable diagnostics are essential for early detection and efficient management [3-4]. This study evaluated the use of key renal and cardiac biomarkers in Lithuania.

Methods: This retrospective study analyzed national health data of 923,329 adults aged ≥40 years from the Electronic Health Services and Cooperation Infrastructure Information System (ESPBI IS). The use of eGFR, ACR and NT-proBNP testing across CKM syndrome stages, cardiovascular disease (CVD) outcomes, and CKM-related conditions was evaluated.

Results: A total of 34.8% of the study population met criteria for stage 4 CKM syndrome, defined by the presence of ≥1 CVD. eGFR was measured in approximately half of the study population, whereas ACR and NT-proBNP testing were infrequent. NT-proBNP was mainly evaluated in patients with heart failure (HF) (22.4%) and with multiple CVD diagnoses (24.5%). ACR testing was even less common, ranging from 17.2% in patients with chronic kidney disease to 5.4% in stroke. Among individuals with stage 1–3, ACR results were available in only 9.0%, and NT-proBNP results in just 4.9%.

Discussion: Annual measurement of eGFR and urinary ACR should become routine in patients with obesity, prediabetes, diabetes or any cardiovascular diagnosis, representing most individuals with CKM stages 1–4. ACR is important because it detects renal damage and strongly predicts cardiovascular events years before eGFR decline becomes apparent. NT-proBNP provides additional insight in HF, atrial fibrillation, multiple CVD, or suspected cardiac strain.

Conclusion: This study identifies underuse of ACR and NT-proBNP testing, indicating missed opportunities for early CKM detection. Broader, guideline-directed implementation of routine eGFR and ACR testing, with NT-proBNP use in high-risk groups, provides earlier identification of reversible CKM stages and optimizes reno- and cardioprotective therapy.

(8) Institute Of Endocrinology, Lithuanian University Of Health Sciences, Kaunas, Lituanie

Context: CKM syndrome integrates metabolic, renal, and cardiovascular risk, yet population-level data in Europe remain scarce. This study examines its prevalence in Lithuanian adults.

Objectives: Cardiovascular diseases (CVD) and chronic kidney disease (CKD) are major health burdens, closely linked through shared pathophysiological mechanisms [1–4]. The recently defined CKM syndrome integrates metabolic risk factors, CKD, and cardiovascular involvement into a single pathophysiological spectrum [5–7]. Despite growing recognition, CKM prevalence data in Europe remain limited. This study aimed to estimate CKM syndrome prevalence in Lithuanian adults.

Methods: Health records of 923,329 adults aged ≥40 years from the national Electronic Health Services and Cooperation Infrastructure Information System (ESPBI IS) were analysed. CKM-associated conditions included prediabetes or type 2 diabetes (T2D), obesity, and CKD. Cardiovascular outcomes included atherosclerotic cardiovascular disease (ASCVD), peripheral vascular disease, stroke, heart failure (HF), and atrial fibrillation (AF). CKM stages were classified as follows: Stage 0 – no CKM conditions; Stages 1–3 – ≥1 CKM-associated condition; Stage 4 – ≥1 cardiovascular diagnosis (incl. ASCVD).

Results: As of January 1, 2024, 1,531,303 Lithuanian residents were aged ≥40 years; 923,329 had health data in ESPBI IS. Mean age was 66.9 years, 59.1% were men. Overall, 23.4% met criteria for CKM stages 1–3, and 34.8% for stage 4. HF (25.4%) and AF (14.0%) were the most common CVD diagnoses. Obesity (21.2%) was the most frequent CKM-associated condition, followed by T2D (17.2%) and CKD (5.5%).

Discussion: This study demonstrates a high prevalence of CKM syndrome in Lithuanian adults, particularly at advanced stages. Frequent early CKM drivers such as obesity, T2D, and CKD likely contribute to progression toward CVD. The stage distribution observed in this large national cohort aligns with patterns seen in other European populations experiencing high metabolic and cardiovascular disease burdens. These findings provide important baseline data for understanding CKM syndrome in the region.

Conclusion: This nationally representative study shows a high prevalence of CKM syndrome in Lithuanian adults, with many already in advanced stages. The distribution of CKM-related conditions provides essential baseline data for future public health and risk-stratification initiatives.

ID 770- Barriers to implementation of the nephrology care in Coordinated Care Model in Polish Primary Care. A survey of family physicians.

Aleksander BIESIADA [1] , Mateusz BABICKI [2], Karolina KŁODA [1], Daria ZAWODNIK [1], Agnieszka MASTALERZ-MIGAS [2]

(1) Polish Society Of Family Medicine, Wrocław, Pologne
(2) Wrocław Medical Univeristy, Wrocław, Pologne

Context: Coordinated care (CC) in Poland has introduced several disease-specific pathways in primary care, to answer the most important civilization health challenges, including cardiology, diabetology, pulmonology/allergology, endocrinology and nephrology. Those are important from whole Europe perspective. However, the nephrology pathway for patients with chronic kidney disease (CKD) is reported to be the least implemented in Polish PC. Meantime early detection and management of CKD (via albuminuria screening and eGFR monitoring) are critical for reducing progression and complications.

Objectives: The aim of this study was to identify the major barriers to the implementation of the nephrology care within Coordinated Care Model from the perspective of physicians working in primary care settings in Poland.

Methods: A cross-sectional CAWI (Computer-Assisted Web Interview) survey was conducted among physicians who are members of primary care teams potentially eligible to implement the nephrology pathway under CC. The questionnaire covered five main sections: general information on pathways and CKD screening, implementation and functioning of the nephrology pathway, collaboration with nephrologists and coordination of care, training and needs for improvement, and barriers to initiation of the nephrology pathway. At least 240 physicians from various PC clinics across Poland participated.

Results: Among responding physicians, common reported barriers included: limited time in PC consultations, insufficient collaboration with nephrologists, lack of awareness of the pathway criteria among staff, inadequate or independent access to screening tests (e.g., UACR, eGFR). Additionally, many physicians from PC facilities with the neurology pathway implemented, reported that only a small proportion of their CKD-risk patients underwent screening or complex consultations as part of the pathway.

Discussion: The study highlights that while the nephrology care has been formally introduced, its actual uptake in primary care remains low. Barriers span organisational, educational, logistical and patient-related domains. Interventions to improve uptake may include streamlined screening procedures, enhanced training for PC teams, improved referral and consultation with nephrology specialists, and patient education on CKD risk.

Conclusion: Addressing the identified barriers is critical to increasing the utilisation of the nephrology pathway under coordinated care in primary care settings. Strengthening implementation may lead to earlier CKD detection, more timely specialist involvement and ultimately better outcomes for patients.

ID 523- Understanding CKD Through a CAREMELO Lens: A Mixed-Methods Evaluation to Inform a Multimorbidity Education Programme for Rural Primary Care Patients

Lisa HAITH, Carl DEANEY

Marsh Medical Practice, North Somercotes, Royaume-Uni

Context: Chronic Kidney Disease (CKD) commonly coexists with conditions forming the CAREMELO multimorbidity cluster—Cardio-Renal-Metabolic-Endocrine-Liver-Obesity. These interrelated conditions significantly influence disease progression, treatment burden and self-management demands. Despite this, patient education in primary care often focuses solely on CKD. Understanding patient needs across the CAREMELO spectrum is critical to designing effective, person-centred education.

Objectives: To examine patients' understanding, confidence, multimorbidity burden, information needs and preferred learning formats in relation to CKD, and to use these findings to develop a CAREMELO-aligned CKD education programme suitable for primary care populations.

Methods: A mixed-methods survey was distributed electronically to adults with recorded CKD in a rural primary care setting. Quantitative data were analysed descriptively, while qualitative free-text responses underwent inductive thematic analysis. Integration of both strands enabled a comprehensive assessment of needs, perceptions and barriers.

Results: A total of 210 patients responded (95.7% consenting). The cohort was predominantly older (65–79 years: 65%; ≥80 years: 28%). CAREMELO-related multimorbidity was common: breathing problems (36%), obesity (20%), heart disease (20%) and diabetes (14%). Confidence in managing CKD varied; 36% felt "not very" or "not at all" confident. Patients identified key information needs: understanding test results (58%), medicines and treatments (53%), diet and nutrition (46%) and exercise/weight management (26%). Preferred learning methods reflected mixed digital literacy: 64% preferred one-to-one clinician discussions, 24% face-to-face groups, 23% printed materials, and 23%

online reading. Qualitative findings revealed significant communication gaps, including unexpected diagnoses delivered via text, confusion over CKD terminology, and limited opportunity for personalised explanation. Patients described difficulty managing overlapping cardiometabolic and respiratory conditions, reflecting CAREMELO multimorbidity.

Discussion: Findings demonstrate substantial unmet needs relating to understanding CKD and its multimorbidity context. Patients require clear explanations of test results, tailored guidance on lifestyle and medication, improved communication pathways and flexible, accessible formats.

Conclusion: This mixed-methods evaluation informed the development of a CAREMELO-aligned CKD education programme incorporating personalised explanation, multimorbidity-focused content, multiple learning formats and improved communication. Such programmes may enhance confidence, self-management and holistic primary care support for patients with CKD.

Corresponding author: Lisa Haith, lisa.haith@nhs.net

ID 516- Clinical characteristics and management of chronic kidney disease in primary care: a retrospective multicenter study

Nicolas DE CHANAUD, Roxane LIARD, Nathanaël BEEKER

Ipso Santé, Paris, France

Context: Chronic kidney disease (CKD) is a major public health problem, and its diagnosis and management in primary care settings are often complex. The CKD01 study was conducted to better understand the characteristics of CKD patients and their management in a French general practice network.

Objectives: The primary objective of this research was to describe the demographic and clinical characteristics of patients diagnosed with CKD within a primary care network. Secondary objectives included describing the modalities of diagnosis and patient management, and evaluating the concordance between the general practitioner's diagnosis and indirect signs in the medical record.

Methods: This was a descriptive retrospective cross-sectional study using data from electronic health records of a primary care network between April 1, 2015, and July 8, 2025. The study population included patients followed in general practice who met CKD criteria (medical history, long-term illness status, or repeated biological abnormalities). Collected data included sociodemographic information, medical history and comorbidities, physiological and biological data, drug treatments, and care pathways.

Results: 731 patients were included, with a mean age of 71.3 years and a slight female predominance (55.4 %). Frequently observed comorbidities were hypertension (58.5 %), diabetes (35.4 %), and cardiovascular diseases (37.2 %). Stratification according to the KDIGO matrix revealed a distribution of patients across different CKD stages. A significant finding was the underdiagnosis or under-reporting of CKD, with 62.7% of patients presenting biological abnormalities characteristic of CKD but without explicit mention of this diagnosis in their medical history. Antihypertensive treatments (ACE inhibitors/ARBs) and SGLT2 inhibitors were frequently prescribed.

Discussion: This real-world retrospective study provides a portrait of CKD in primary care. KDIGO stratification showed a relatively homogeneous distribution and increasing comorbidity with severity, suggesting all CKD stages are represented. A major finding is the infrequent explicit mention of CKD in medical records, with 62.7% of patients identified solely by biological measurements, and these patients having a more severe progression stage and more prevalent comorbidities.

Conclusion: This study highlights the under-reporting of CKD in primary care and the suboptimal use of prognostic tools like KFRE. Systematic screening and formal diagnosis are essential to improve patient management in line with current guidelines.

Corresponding author: Nathanaël Beeker, nathanael.beeker@ipsosante.fr

ID 494- Addressing Guideline

Fragmentation in CKD: From SGLT2 Underprescription Audit to an Integrated Clinical Decision Support Tool

Jesus F. TORRES-PERAZA, Anna BUNTEN

Nene Valley Hodgson Medical Practice, Peterborough, Royaume-Uni

Context: Despite robust evidence for SGLT2 inhibitors in chronic kidney disease, fragmented NICE guidelines across multiple conditions create implementation challenges in primary care. Understanding variation in uptake across patient groups in primary care could inform targeted quality improvement strategies.

Objectives: To evaluate adherence to evidence-based CKD management, identify SGLT2 inhibitor treatment gaps across comorbidity groups, and develop an integrated clinical decision support tool addressing guideline fragmentation.

Methods: Retrospective cohort audit of 292 CKD patients at a UK general practice using ECLIPSE informatics platform. Inclusion criteria: ACR above 20 mg/mmol, eGFR decline exceeding 15 mL/min, or uncontrolled hypertension. Analysis included demographics, comorbidities, biochemical monitoring, blood pressure control, and medication adherence. An integrated clinical flowchart was developed combining CKD diagnostic criteria, NICE referral pathways, and evidence-based pharmacotherapy algorithms including SGLT2 eligibility criteria across all indications.

Results: 279 CKD patients analysed (median age 70-79 years). Comorbidities: hypertension (86%), diabetes (44%), cardiovascular disease (32%), heart failure (11%). Blood pressure control achieved in 68%. High-intensity statin use: 87% secondary prevention, 78% primary prevention. Only 67 patients (24%) received SGLT2 inhibitors despite 165 meeting eligibility criteria, representing 35% treatment gap (98 patients). Critically, SGLT2 uptake varied significantly by comorbidity: heart failure patients achieved 61% uptake versus 47% in diabetic patients without heart failure. Among 64 patients with single eligibility criteria not receiving SGLT2, diabetes was sole indication in 36 patients (56%), while heart failure alone accounted for only 2 patients (3%). ACR monitoring remained suboptimal (71% completion). Audit triggered 156 blood test requests, 94 urine ACR requests, 48 SGLT2 initiations, 34 ACEI/ARB adjustments, and 24 secondary care referrals.

Discussion: Paradoxically, despite originating as diabetes medications, SGLT2 inhibitors show superior uptake in heart failure (61%) versus diabetic CKD (47%). This disparity reflects that heart failure guidelines mandate SGLT2 regardless of LVEF, whereas diabetes guidelines frame SGLT2 as HbA1c-dependent rather than renoprotective. Fragmented care delivery in England, where diabetes specialist nurses conduct reviews while GPs manage CKD, creates accountability gaps. Rapidly evolving guidelines across conditions further complicate implementation.

Conclusion: SGLT2 underprescription in diabetic CKD represents significant quality gap. Integrated decision support tools and clear condition-agnostic renoprotection protocols could replicate heart failure pathway success.

ID 449- Guideline adherence in chronic kidney disease management in XXX primary care

Iris LEENSTRA, Sander VAN DOORN, Bertien HART

Julius Center For Health Sciences And Primary Care, University Medical Center Utrecht, Utrecht University, Utrecht, Pays-Bas

Context: Chronic kidney disease (CKD) is a major health problem for which early detection and appropriate management by the general practitioner (GP) are essential. It is unknown to what extent GPs adhere to the XXX national guideline “chronic kidney disease” in daily clinical practice and whether they could benefit from a clinical decision support system (CDSS).

Objectives: This study aims to evaluate guideline adherence in chronic kidney disease management in XXX primary care.

Methods: Retrospective analyses of a GP database were performed. Adults registered by the 1st of

April 2024 at a general practice of one of the XXX healthcare centres, with at least one abnormal estimated Glomerular Filtration Rate (eGFR) measurement and/or Albumin-Creatinine Ratio (ACR) measurement during the period of the 1stof April 2024 up until the 30th of September 2024 were included. Adherence to the guideline on "chronic kidney disease" by the XXX College of General Practitioners was assessed in patients with newly diagnosed CKD or potential CKD, evaluating repeat testing intervals, CKD recognition, cardiovascular risk management and medication prescription.

Results: Out of 681 patients, 234 had a first abnormal eGFR or ACR value. Less than half of the patients received a recommended follow-up test within the study period after a first abnormal eGFR or ACR test result. Almost three quarters of the patients received lipid panel tests and almost two-thirds received blood pressure measurements. Registration of the diagnosis code was low, whereas registration of the contra-indication code was slightly higher.

Discussion: A key strength of this study is its use of real-life data. However, several limitations should be considered, such as the relatively small sample size, the short follow-up period and the risk of missing data. The results on follow-up testing frequencies, lipid panel testing values, and CKD recognition were in line with those of previous studies. Performance of blood pressure measurements varied between studies.

Conclusion: Limited guideline adherence was found for CKD management in XXX primary care, leaving room for improvement. A second, comparable study will evaluate the effect of the CDSS on quality of care in chronic kidney disease management. Keywords: Chronic kidney disease, primary care, guideline adherence.

ID 1724- Thuisarts as a national media platform: guiding patient behavior for appropriate care and relieving pressure on primary care

Jako BURGERS, Raymond WETZELS, Woldhuis SWANET

Dutch College Of General Practitioners, Utrecht, Pays-Bas

Context: The persistent pressure on general practice requires interventions that not only support professionals but also (potential) patients before they seek care. In 2012, the Dutch College of General Practitioners (NHG) launched a public website, Thuisarts ('home doctor'), with trustworthy information on health, symptoms, and diseases based on guidelines developed by professional societies in collaboration with patient organisations.

Objectives: To describe the development and maintenance of Thuisarts as a national media platform supporting self-management in the context of competing digital sources.

Methods: GP and specialist guidelines on a broad range of topics were produced in co-creation with partners across primary and secondary care as part of programs supported by the government. This included the development of public and patient information to implement the guidelines in practice. Thuisarts was designed to enhance access to context-specific content and to promote self-care and a healthy lifestyle. Generative AI was used for personalised information (e.g., post-GP vs. post-specialist visit). Its use was measured with website parameters and digital surveys.

Results: Annual use of Thuisarts.nl has increased from less than 1 million visits in the first year to approximately 72 million visits in 2024 (200,000 per day). The website covers more than 600 topics. Popular topics include children with fever, urinary tract infections, sore throats, and sexually transmitted diseases. During the COVID-19 pandemic, information about COVID-19 was accessed most frequently. Almost all GPs (98%) used Thuisarts.nl, and 85% advised patients to consult the website. All stakeholders supported its maintenance with public funds and the introduction of artificial intelligence to promote self-management.

Discussion: Influencing patient behavior requires media, data expertise, and strict quality assurance. Thuisarts can be considered as an antidote to

misinformation, supporting patient autonomy, equal access to reliable knowledge, and interprofessional collaboration to improve the quality of care. Broad support from all stakeholders involved in healthcare is a crucial determinant of success.

Conclusion: Thuisarts demonstrates that a combined approach of excellent content, technology, and care integration supports GPs and patients in decision-making before seeking care, relieving pressure on general practice. Further scale-up and rigorous scientific evaluation are essential to increase impact and facilitate implementation.

ID 1703- Living lab approaches in rural healthcare: a scoping review of use, contexts, and gaps

Richard FLEET [(1)] , Rose JOYAL [(2)], Diane SINGHROY [(3)], Tounkara FATOUMATA [(1)]

(1) Université Laval, Québec, Canada
(2) Université De Montréal, Montréal, Canada
(3) Ubc, Vancouver, Canada

Context: Rural and remote populations continue to experience inequities in access to healthcare services. Although these challenges are well documented, translating evidence into locally adapted and actionable solutions remains difficult. Living labs offer a user-centred, real-world approach to innovation through co-design, yet their application in rural healthcare remains limited.

Objectives: To synthesize and characterize published applications of living lab approaches in the design, development, or implementation of rural healthcare services and innovations.

Methods: This scoping review followed PRISMA-ScR guidelines. A systematic search of MEDLINE, EMBASE, and CINAHL was conducted on May 10, 2025, to identify peer-reviewed studies describing living lab or participatory approaches applied to rural healthcare services or innovations. Two reviewers independently screened studies, extracted data using a standardized form, and synthesized findings using descriptive statistics and narrative analysis.

Results: The search identified 1,080 articles, of which 11 met inclusion criteria. Studies were published between 2016 and 2025 and conducted in Canada (n=3), the United States (n=3), Australia (n=2), Guatemala (n=1), Uganda (n=1), and France/Portugal (n=1). Settings included rural hospitals, regional health networks, Indigenous communities, farming and fishing communities, and underserved regions. Targeted health domains included cardiovascular disease, diabetes, musculoskeletal conditions, perinatal care, palliative care, and infectious disease management. Methodologies included theory-driven frameworks (n=4), community-based participatory research (n=4), user- or human-centred design (n=3), and co-design workshops or interviews (n=3). Only one study explicitly used the term “living lab.”

Discussion: This scoping review highlights that, despite participatory and user-centred innovation, living lab approaches have been infrequently and inconsistently applied in rural healthcare. Existing studies show considerable methodological heterogeneity, with many relying on participatory or co-design principles without explicitly framing their work as a “living lab.” Applications have focused on specific clinical domains and limited geographic regions, suggesting missed opportunities to address broader rural health system challenges. The lack of evaluation frameworks limits comparability across studies and constrains the accumulation of transferable knowledge, underscoring the need for clearer conceptualization and stronger methodological reporting.

Conclusion: Living lab approaches remain underutilized in rural healthcare. Clearer conceptualization, broader application, and more robust evaluation are needed to fully assess their potential to support innovation and equity in rural health systems.

ID 1604- Exploring impacts of implementing a participatory primary care approach on patients’ experience and

professional practice in deprived settings: a qualitative study

Maeva JEGO [(1)] , Alexia BONNAIRE [(2)], Axel GRANGE [(1)], Margaux BORG [(1)], Pascal AUQUIER [(3)], Jérémy KHOUANI [(1)]

(1) Aix-Marseille Université, Faculté Smpm, Département De Médecine Générale, Marseille, France
(2) Msp Universitaire Peyssonnel, Marseille, France
(3) Aix-Marseille Université, Ceress, Marseille, France

Context: People experiencing socioeconomic hardship face barriers in accessing healthcare despite having greater health needs. The literature highlights the need for multidisciplinary interventions integrating somatic, mental and social care, to improve access to care of vulnerable populations. In France, a program supported the implementation of a participatory approach within multi-professional primary care centres, combining health mediation, professional interpreting, outreach, and patient's participation in the centre organization.

Objectives: To explore the effects of this participatory approach on both patients and healthcare professionals working within a multi-professional primary care centre (XXX) implementing a participatory approach.

Methods: A qualitative study using a grounded theory approach was conducted among patients engaged in participatory activities and among professionals working at or partnering with the Centre XXX. Semi-structured individual interviews and focus groups were carried out. All interviews were analysed inductively, with triangulation by three researchers.

Results: Forty-eight participants were included (25 patients and 23 professionals). Patients described a shift towards more horizontal, trusting and supportive relationships with healthcare professionals, in contrast with previous care experiences. Engagement in, and benefits from, the participatory approach appeared greater among socially isolated individuals. Patients reported benefits related to social empowerment , that supported better patient's skills for accessing health care, sometimes associated with a perceived improvement in health. Professionals reported an evolving organisational culture marked by the coexistence of institutional and private-practice logics and the progressive appropriation of participatory methods. Although the concept of "participatory approach" remained unclear for many, it was perceived as beneficial for improving access to care and adapting practices to the needs of people in precarious situations. The required investment was significant and sometimes created tensions between clinical demands and participation in non-clinical activities.

Discussion: This study provides an initial exploration of a participatory-based model implemented within a coordinated primary care centre in France. Further studies in different primary care settings are needed to obtain an holistic comprehension of the effects of this approach.

Conclusion: The participatory primary care approach appears to enhance patient empowerment, foster more horizontal care relationships and support more active healthcare use among people facing precarity, while also transforming professional practices and organisational dynamics.

ID 1511- Ronte'nikonhrarò:roks: Developing an Indigenous-led Research Partnership to Promote Child and Family Health through Storytelling

Cortney CLARK

Queen's University / Canadian Medical Association, Ottawa, Canada

Context: Examining Indigenous child and family health experiences through a First Nation-based and institutional research partnership.

Objectives: The focus of the study was to examine Indigenous child and family health experiences. To explore and better understand: •How can Indigenous and non-Indigenous researchers collaborate in academic spaces that engage Indigenous Knowledge and Ways of Knowing, Being, and Doing, in the context of a First Nation's Cultural Healing Centre's programming for children and families? • What are the First Nation

members'/residents' individual and community health priorities? • What are the most appropriate ways to share the stories to inform the First Nation's long-term child and family health and educational programming and services?

Methods: Guided by an Indigenous Research Paradigm (IRP) informed by Indigenous traditional Knowledge and research practices, the study was led by Indigenous community members of the partnering First Nation. The study's IRP engages the practice of Indigenous Storytelling methods (data collection) and the meaning-making process involved in Storytelling methods - the Storywork (analyses). The research activities were facilitated through collaboration with the community advisory circle and by conducting community-based Storytelling circles with families in the First Nation. The study focused on the early years program for children and families and two storytelling circles were hosted in partnership with the families in a culturally significant space – the local Cultural Healing Centre.

Results: The stories were analysed through Storywork processes and informed collective recommendations and additional health and educational research priorities for the community to mobilize.Overall, the IRP creates space for Indigenous Peoples to share their Knowledges from their own Worldviews and upholds the Indigenous right to self-determination by promoting traditional healing methods of Storytelling and Storywork.

Discussion: The IRP was tailored to represent traditional healing principles, and community-led research protocols. The Storytelling practice enabled the storytellers to share their own meanings of their lived experiences and depictions of unique historical contexts, that shape their contemporary health perspectives to inform the health and educational priorities in the First Nation.

Conclusion: Overall, I describe my experience in leading an Indigenous Nation-based research study, within a Western-health science doctoral program, and report the First Nation communityrecommendations from the Storywork.

ID 1353- From promoting blood donation to rethinking participation: a participatory pathway with Sub-Saharan communities in Italy

Federica VIOLI, Giulietta Luul BALESTRA, Chiara MARRACCINI, Micol QUARESIMA, Gabriele GAZZANEO, Giusy IORIO, Luca GHIROTTO, Marina SPARANO, Francesca BONVICINI, Benedetta RIBOLDI

Ausl-Irccs Of Reggio Emilia, Reggio Emilia, Italie

Context: In Reggio Emilia (Northern Italy), a growing number of people with sickle cell disease, mostly of Sub-Saharan origin, has created an urgent need for antigen-compatible blood. To respond, a participatory action-research project, DREPANO-DONORS, was launched to co-develop strategies for engaging Sub-Saharan communities in blood donation. As the work evolved, it became clear that blood donation could not be addressed as an isolated behavioural issue, but was embedded in broader experiences of belonging, recognition, discrimination and institutional trust. This shifted the focus from a disease-specific project towards a wider process on migrant participation in health research and planning.

Methods: DREPANO-DONORS combined qualitative, anthropologically informed research with participatory workshops. Interviews, focus groups, informal conversations and participant observation were carried out with current and potential donors, cultural mediators, diaspora associations, religious leaders, and healthcare professionals. Four participatory workshops were convened to discuss findings, validate interpretations and co-design strategies. This process led to the creation of a coordination group including stakeholders of Sub-Saharan origin, clinicians, transfusion specialists and primary care professionals. Building on this experience, the team launched RADICE, a broader action-research initiative in the Primary Health Care Department, aimed at developing structural spaces for migrant participation in local health research, planning and decision-making.

Originality: Rather than treating "culture" as an individual barrier, the experience foregrounded the symbolic and political meanings of blood and the struggles for recognition. Few published examples

describe how disease-specific engagement projects evolve into insti

Lessons learned and future implication: Key lessons include the need to: (1) centre engagement on lived experience and social recognition, rather than on narrow behavioural targets; (2) move from short-term campaigns to sustained spaces for co-creation; (3) explicitly address institutional raci

Discussion: The transition from DREPANO-DONORS to RADICE illustrates how participatory work around a specific clinical issue can open up broader debates on liberty, equity and fraternity in primary healthcare.

Conclusion: This case shows how a project initially framed as “engaging a hard-to-reach group” for blood donation became a catalyst for rethinking migrant participation in health services.

Ausl-Irccs Of Reggio Emilia, Reggio Emilia, Italie

Context: In Italy, recent national reforms are redefining primary care delivery, emphasizing community-based structures (Case della Comunità, Community Health Centres, CHC) that integrate health and social care through multidisciplinary teamwork and community involvement. In this context, a peripheral primary care centre was redesigned following a hub-and-spoke model.

Methods: The redesign included a structured reorganization of spaces, grouping services into functional macro-areas in alignment with national guidance; redefinition of care pathways between the centre and its reference hub; and implementation of a comprehensive wayfinding project. Interventions included redesigned internal and external signage, colour-coding of functional areas, and reorganized entry points to facilitate physical and cognitive accessibility. The centre also piloted extended medical and nursing presence for 12 hours a day, six days a week, ensuring access for all users regardless of GP affiliation. Community participation was promoted through a shared board involving citizens, local associations and third-sector organizations, jointly planning public events and health-promotion initiatives. Strengths included strong multidisciplinary collaboration; limitations include the absence of quantitative outcomes at this early stage.

Originality: There is limited documentation on approaches that combine organizational redesign with structured wayfinding as facilitators of accessibility, equity and user experience. This centre is the first example in the province—and among the earliest nationally—f

Lessons learned and future implication: Key lessons include the value of co-design with professionals, early involvement of technical teams, and alignment of functional planning with architectural solutions. A participatory research project launched in November 2025 is engaging professionals an

Discussion: This experience shows how organizational and spatial redesign, strengthened multidisciplinary care and community participation can jointly enhance accessibility, continuity and user experience in peripheral settings.

Conclusion: The transformation demonstrates how the national CHC model can be effectively implemented through integrated organizational, spatial and participatory strategies. Further evaluation, including the forthcoming participatory project, is needed to assess outcomes and guide future adaptations.

ID 2126- Cognitive Screening in Diverse Populations: Limitations and Clinical Implications

Charlotte MORRIS [(1)] , Emma ELLIOT [(1)], Marina JOTIC IVANOVIC [(2)]

(1) The University Of Manchester, Manchester, Royaume-Uni
(2) Public Primary Health Care Center, Doboj, Bosnie-Herzégovine

Context: Many people present to their GP with concerns about cognitive decline. A range of cognitive screening tests are available for use in primary care, but no single test is recommended by guidance across Europe, which leaves the decision to the individual GP. Most tests do not account for educational attainment, were not developed for ethnic minority groups (and are biased towards specific language or cultural knowledge), are less sensitive to early stages of cognitive decline and non-Alzheimer's disease type dementia. Most GPs do not get formal training specifically on cognitive screening.

Objectives: To equip GPs with increased knowledge of administration and scoring of cognitive screening tests, including different options and the considerations of education, ethnicity and dementia type, drawing on the current evidence. To understand if/how cognitive screening is used in primary care in different European settings. To explore attendees' views on proposed changes/improvements to cognitive screening in primary care and to understand where GPs want further training developed.

Teaching method and workshop: The workshop will use an interactive, mixed-methods teaching approach. Short evidence-informed presentations will introduce key cognitive screening tools, their administration and scoring, and considerations. Case-based learning using primary care scenari

Expected outcomes: Participants will have increased knowledge and confidence in cognitive screening, understand key limitations and options of tests for specific groups of patients. We will understand from different European contexts if/how cognitive screening is used.

Conclusion: This workshop will cover the assessment of cognitive impairment by primary care practitioners, based on the current evidence base and sharing best practice. The interactive workshop will foster collaboration and shared learning about an important, often overlooked, part of primary care.

ID 1785- Family doctors' role in early detection of mild cognitive impairment and its prevalence within routine primary care practice settings populations.

Tatjana MLADENOVIĆ, Aleksandra JEŠIĆ

2 Primary Health Care Center „novi Beograd", Belgrade, Serbia; Scientific Board Of Serbian Medical Association, Belgrade, Serbie

Context: The concept of MCI has evolved since its first definition in 2003 and is widely used by both researchers and clinicians to define the gray zone between intact cognitive functioning and clinical dementia. It is estimated that about 3–22% of individuals older than 65 years have MCI. It is assumed that 50% of persons with MCI will develop dementia, which represents a significant socioeconomic problem for society. Currently, there are no sufficiently effective diagnostic tools nor an effective cure for dementia. The Montreal Cognitive Assessment (MoCA) test has been validated as a highly sensitive (90%) tool for the early detection of MCI.

Objectives: The aim of our study was to assess the frequency of cognitive impairment, i.e., to evaluate cognitive status in patients with comorbidities in our medical records in the population aged 50 years and older, to determine the prevalence of MCI, and to analyze the association between cognitive decline and predictors of dementia.

Methods: We used anamnestic data and laboratory analyses from available medical documentation, and the MoCA test to assess cognitive abilities. We tested 200 patients, including 89 men and 111 women aged 50 years and older, who did not complain of memory problems but were at increased risk of developing dementia. Of

these, 130 (65%) participants were aged 65 years or older.

Results: Of the 200 examined participants, 138 (69%) had normal findings (MoCA score 26–30), while 62 (31%) had findings consistent with MCI (MoCA score 21–25). The prevalence in the examined group aged 65+ was 26% (52 individuals). Participants most frequently lost points in short-term memory, visuospatial abilities, and language.

Discussion: The results of testing indicate that the prevalence of MCI in our patient registries is slightly higher than expected. Dementia significantly impairs quality of life for both patients and their family members. Therefore, it is necessary to detect MCI using screening methods and to initiate available therapeutic modalities at an early stage.

Conclusion: To identify MCI as early as possible, it is essential to test at-risk patients even before the onset of the first clinical symptoms. This is possible only if familly doctors are included in the screening process.

ID 1706- Associations of Orthostatic Blood Pressure Changes with incident Dementia in Older Men: Prospective findings from the British Regional Heart Study

Dena ETTEHAD [(1)] , Olia PAPACOSTA [(1)], Lucy LENNON [(1)], Cini BHANU [(1)], Sheena E RAMSAY [(2)], S Goya WANNAMETHEE [(1)]

(1) Ucl Department Of Primary Care & Population Health, London, Royaume-Uni
(2) Institute Of Health & Society, Newcastle University, Newcastle, Royaume-Uni

Context: Dementia is a significant and growing global Public Health challenge. The Lancet Commission on Dementia identified 14 modifiable risk factors, including hypertension, but did not examine the impact of orthostatic blood pressure (BP) changes. Understanding the link between orthostatic BP changes and dementia risk may present an intervention target for dementia prevention given that studies have suggested that different forms of BP dysregulation may be linked to cognitive decline in older adults.

Objectives: This study aimed to assess the associations of orthostatic BP changes with incident dementia in older, community-dwelling adults.

Methods: Longitudinal analysis of 1605 men aged 71-92 years with no diagnosed dementia followed for an average of 12 years in whom 268 developed dementia. Incident dementia was obtained through general practice medical records. Orthostatic blood pressure changes were defined as orthostatic hypotension (OH) (sitting-to-standing decrease in systolic BP ≥20 mm Hg or diastolic BP ≥10 mm Hg), orthostatic hypertension (sitting-to-standing increase in systolic BP ≥20 mm Hg or diastolic BP ≥10 mm Hg), and orthostatic normotension (neither OH nor orthostatic hypertension). Systolic and diastolic OH was also examined separately. Survival analysis was used to estimate associations of orthostatic BP changes with dementia.

Results: Compared to orthostatic normotension isolated diastolic OH (diastolic BP decrease >=10 mmHg) but not isolated systolic OH (systolic BP decrease >=20 mmHg) was significantly associated with increased risk of dementia after adjustment for possible confounders and incident cardiovascular disease (CVD). The hazard ratio (95% CI) was HR=2.11 (1.39, 3.22) and HR=(0.77, 0.48-1.21) in men with isolated diastolic and isolated systolic OH, respectively. The increased risk associated with isolated diastolic OH was seen for all types of dementia (vascular, Alzheimer's and others). No association was seen with orthostatic hypertension [HR=1,04 (0.70,1.54)].

Discussion: Our findings may have practical implications. From a diagnostic standpoint, diastolic OH may be an important clinical marker of dementia risk whereas from a therapeutic standpoint, these results highlight the potential for interventions aimed at stabilising orthostatic BP.

Conclusion: In this study of older men, isolated diastolic OH is associated with increased dementia risk. Further prospective studies in diverse cohorts and interventional studies are needed to confirm our findings.

ID 1536- Early Cognitive Complaints and Mobility Dysfunction in Older Adults: An Association That Primary Health Care Should Recognize

Gustavo CHRISTOFOLETTI, Patrícia De Morais FERREIRA BRANDÃO

Federal University Of Mato Grosso Do Sul, Campo Grande, Brésil

Context: Primary health care plays an important role in maintaining population health and managing comorbidities. In older adults, age-related changes frequently impair cognitive function and mobility, thereby increasing the risk of falls and associated injuries.

Objectives: To investigate whether older adults with subjective cognitive decline (a preclinical self-perceived cognitive decline) exhibit greater mobility impairment than their counterparts who do not report cognitive concerns.

Methods: Sixty-two community-dwelling older adults (mean age: 67.7 ± 6.0 years) were recruited from primary health care services. The mean MMSE score was 27.7 ± 1.6, and no participant reported falls in the past 12 months. To investigate the relationship between the perception of early cognitive decline and motor dysfunction, participants completed the Geriatric Depression Scale item 10, which asks whether they feel they have more memory problems than most people. Mobility was assessed using the Timed Up and Go (TUG) test combined with a motion analysis system. The variables assessed included TUG time, step length, turn duration, and sit-to-stand time. This study was approved by the Institutional Ethics Committee.

Results: Twenty-three participants reported subjective cognitive decline, and thirty-nine did not. Those with cognitive concerns were older ($p = 0.027$), had lower MMSE scores ($p = 0.002$), and took longer to complete the sit-to-stand phase of the TUG test ($p = 0.024$). Age was negatively correlated with MMSE performance ($r = –0.343$), and lower MMSE scores were associated with longer sit-to-stand duration ($r = –0.301$).

Discussion: Subjective cognitive decline refers to the self-perceived cognitive difficulties that occur despite the absence of mild cognitive impairment or dementia. This condition may represent an early preclinical stage of cognitive decline and should be carefully considered by primary care professionals.

Conclusion: Older adults with subjective cognitive decline exhibit subtle mobility impairments, indicating potential onset of broader motor dysfunction. Implementing effective strategies to monitor cognitive function in primary health care is essential to enable timely intervention, more accurate risk stratification, and enhanced preventive care.

ID 1244- Assessment of a diagnostic strategy to detect cognitive impairment in primary care: a prospective multicentric study

Laurent LETRILLIART [(1)] , Virginie DAUPHINOT [(2)], Antoine GARNIER-CRUSSARD [(3)]

(1) Research On Healthcare Performance (reshape, Inserm U1290), Université Claude Bernard Lyon 1, Lyon, France
(2) Clinical Research Center Ageing-Brain-Frailty, Clinical And Research Memory Centre Of Lyon, Lyon Institute For Aging, Charpennes Hospital, Hospices Civils De Lyon, Lyon, France
(3) Clinical Research Center Ageing-Brain-Frailty, Clinical And Research Memory Centre Of Lyon, Lyon Institute For Aging, Charpennes Hospital, Hospices Civils De Lyon ; Université Claude Bernard Lyon 1, Cnrs, Inserm, Centre De Recherche En Neurosciences De Lyon Crnl U1028 Umr5292, Lyon, France

Context: The prevalence of neurocognitive disorders is increasing worldwide. Their accurate and timely detection remains a challenge in primary care since there is no validated strategy to detect them at mild cognitive impairment (MCI) or dementia stages.

Objectives: To assess the accuracy of a standardized approach involving three steps in primary care and taking less than 10 minutes.

Methods: In this observational prospective multicentric study, 36 French GPs included adult patients aged ≥65 years with cognitive complaints, applied the diagnosis strategy and then systematically referred patients to specialist consultations in 11 tertiary memory clinics (MC). The three assessment steps were as follows: (i) the GP's clinical judgement; (ii) a functional assessment using part 2 of the General Practitioner Assessment of Cognition (GPCOG) test, then GP's clinical judgement; (iii) and an assessment of cognitive status using the Six Item Cognitive Impairment Test (6CIT), then GP's clinical judgement. The statistical performances of this strategy were estimated using the neurocognitive disorder diagnosis established in MC as reference, comparing patients with any neurocognitive disorder to other patients. They were compared to the performances of the Mini-Mental State Examination (MMSE).

Results: A total of 165 patients were enrolled and completed the study, including 71 (43.0%) with MCI and 41 (24.8%) with dementia. The highest diagnostic accuracy was achieved after completion of the full diagnostic strategy in primary care, with sensitivity increasing from 69% after step 1 to 83% after step 3, and with consistently good positive predictive values (84–87%) across all steps. The area under the curve (AUC) of this strategy increased from 0.77 at step 1 up to 0.86 at step 3, which was higher than the AUC of the MMSE (0.82).

Discussion: The assessed strategy had good performances to detect neurocognitive disorders in general practice. The in-depth assessment of patients in memory clinics is a strength of this study. This strategy might be combined with the use of blood biomarkers if they are validated in primary care in the future.

Conclusion: A short, graduated strategy including functional and cognitive assessments and GP's clinical impression, proved to be relevant for detecting patients with MCI or dementia in primary care.

ID 1241- Decision-Making Capacity, Cognitive Decline, and Autonomy: A Literature Review of Ethical, Legal, and Clinical Frameworks in the EU

António Bartolomeu JÁCOMO [(1)] , Miguel VIEIRA [(2)], Maria Teresa SILVA [(3)]

(1) Toxrun-Cespu, Gandra, Portugal
(2) Center For Bioethics Research / Nova School Of Law Of Univeristy Nova Of Lisbon, Lisbon, Portugal
(3) Faculty Of Medicina Of The Catholic University Of Portugal, Lisbon, Portugal

Context: Decision-making capacity is foundational to autonomy and legal personhood. In contexts of cognitive decline—such as dementia, intellectual disability, or psychiatric illness—healthcare professionals must assess capacity to consent, often within complex ethical and legal frameworks.

Objectives: To review existing literature on decision-making capacity and autonomy in cognitively impaired individuals, with emphasis on neuroethical, legal, and clinical dimensions, and how these are addressed in the European Union (EU), particularly in Portugal and France.

Methods: A narrative literature review was conducted using PubMed, Scopus, and legal databases. Sources included peer-reviewed bioethics and legal journals, EU case law (ECtHR), and grey literature such as reports from the Council of Europe and the UN Committee on the Rights of Persons with Disabilities (CRPD). National legislation in Portugal and France was analyzed to identify reforms and alignments with CRPD principles.

Results: Findings highlight a shift from paternalistic substituted decision-making models to supported decision-making, especially under the CRPD. Portugal's 2018 reform replaced guardianship with individualized support measures, emphasizing will and preferences. France has partially reformed its tutelle system but retains substitute decision-making. Ethical frameworks are evolving to include relational autonomy, recognizing the role of social support in preserving agency. Clinically, tools such as the MacCAT-T assess capacity, yet are inconsistently applied across settings. Jurisprudence from the European Court of Human Rights increasingly protects autonomy, requiring proportional, reviewable restrictions.

Discussion: Despite progress, many systems remain structurally paternalistic. Neuroethical debates around cognitive enhancement, involuntary treatment, and advance directives underscore tensions between autonomy and protection. The interplay of national laws and international human rights obligations reveals inconsistencies in implementation, particularly regarding informed consent and legal capacity.

Conclusion: There is a growing consensus in EU health law and ethics toward capacity maximization and autonomy support. Legal reforms, especially in Portugal, offer promising models. Further research is needed to evaluate implementation and develop interdisciplinary frameworks that balance autonomy, capacity, and care.

ID 49- Cognition and digital money management in older people

Ana Maria GARCIA-RODRIGUEZ, Miguel Jose SANCHEZ-VELASCO, Maria Almudena CUESTA-QUINTERO, Rebeca HERNANDEZ-ROMAN, Cristina FANARRAGA-VERGEL, Javier RODRIGUEZ-PEREZ, Pablo GONZALEZ-GARCINUÑO, Irene ASENJO-CABRERO, Beatriz REJAS-DE CASTRO, Isabel ESTEBAN-SAE

Cs Plaza Ejercito Gerencia Valladolid Oeste, Valladolid, Espagne

Context: The rapid digitalization of financial services challenges older adults, whose ability to manage digital money depends on multiple cognitive domains such as memory, calculation, planning, and executive function. Cognitive impairment may compromise financial autonomy and increase vulnerability to digital fraud. This study analyzes alterations in monetary calculation and explores whether digital money management may be beneficial or risky for older adults with cognitive decline.

Objectives: To identify cognitive differences by age, sex, education, and COVID-19 history using the SAGE test; and to assess, through a SWOT–CAME analysis, the implications of digital money management for individuals with cognitive impairment.

Methods: A cross-sectional observational study was conducted between 2024 and 2025 at XXXXXX. The Self-Administered Gerocognitive Examination (SAGE) was administered to 380 patients aged ≥14 years. Sociodemographic variables and COVID-19 history were analyzed. A score <17 indicated probable cognitive impairment. Statistical tests included chi-square and Student's t-test ($p<0.05$). Subsequently, a SWOT–CAME analysis examined strengths, weaknesses, opportunities, and threats of digital financial management in older adults with cognitive decline.

Results: Of the 380 participants, 59.2% were women (mean age 54.9 ± 20.3 years). Educational levels were 40.0% secondary, 27.6% university, and 32.4% primary. The global prevalence of SAGE ≤17 was 48.7%, and 38.2% among those aged ≥60. Calculation impairments affected 58.8% (money1: 33.5%; money2: 25.3%), sequencing 20.6%, and recent memory 43.5% ($p<0.05$ for ≥60 vs. <60). Even participants ≥60 with normal SAGE scores showed calculation/planning deficits (28.6%), and 47.3% had at least one banking-related topic altered.

Discussion: Cognitive decline in domains related to calculation and planning appears early, even before global impairment, suggesting a specific vulnerability to digital financial management. Digital literacy may act as "technological reserve," preserving cognitive function and autonomy, but lack of training, interface complexity, and fraud exposure remain major risks. Primary Care can play a pivotal role in prevention and digital inclusion.

Conclusion: Early dysfunctions in calculation and planning indicate increased susceptibility to digital financial challenges. Digital money management may support autonomy and healthy aging if protective frameworks—technological, legal, and educational—are ensured. Primary Care should serve as a sentinel system promoting safe digital participation among vulnerable populations.

Communication

ID 1194- Beyond medical jargon: linguistic strategies for shared understanding in general practice

Alix FERNET-SCHERER [(1)] , Marion GIROUD [(2)], Yohann VERGÈS [(1)]

(1) 1department Of Family Medicine, Toulouse, France
(2) 1department Of Family Medicine, Sorbonne Université, France

Context: Systematic reviews on medical communication highlight that unclear medical language negatively impacts health outcomes and patient safety. In consultations, two languages coexist: everyday language and technical language, often termed medical speak. Thus, general practice consultations require significant linguistic work essential for achieving shared understanding. This competence is especially crucial for general practitioners (GPs), who serve as the interface between patients and the healthcare system.

Objectives: This study aims to identify the linguistic processes employed by GPs during consultations to reduce discourse opacity.

Methods: We conducted an ethnographic study of GP consultations between March and May 2024. Inclusion criteria included GPs with over five years of practice, native French speakers, and medical training in France. Each physician, recruited through direct solicitation, was observed over several consecutive days. Consultations were observed, and verbal exchanges transcribed in field notes. Observations continued until data saturation was reached. Transcripts were analyzed with an inductive approach inspired by grounded theory, with data triangulation.

Results: Three levels of linguistic processes were identified, corresponding to three levels of opacity: 1) Vocabulary translation: vocabulary and grammar cause misunderstandings requiring translation activities (adjacent synonyms, paraphrastic reformulation, explaining abbreviations). 2) Semantic clarification: polysemy (e.g., "negative") causes confusion. GPs clarify meanings through simplification and popularization. 3) Perspective alignment: divergent perspectives cause misunderstandings and false assumptions. Overcoming this requires linguistic strategies to explore the patient's viewpoint and make the medical perspective explicit (clinical scripts, internal reflection, automatisms).

Discussion: Strengths of this study include an innovative methodology rarely applied in primary care, capturing real-world data, and co-supervision with sociologists. Limitations include small sample and the Hawthorne effect. Future perspectives involve training to enhance verbal communication in GPs clinical practice

Conclusion: Verbal language is key to patient comprehension. When consciously used, it opens a window into the patient's world, restores symmetry in the physician-patient exchange, and fosters genuine mutual understanding.

Corresponding author: Alix Fernet-Scherer, dr.fernetscherer@gmail.com

ID 1310- Improving Medication Adherence Through Labeling in the Pomeranian Language: An Experience Report

Marcella LIMA SEIBERT GRIGATO [(1)] , Felipe SANTOS [(2)], Fernanda DILLY [(3)]

(1) Prefeitura Municipal De Santa Maria De Jetibá, Santa Maria De Jetibá, Brésil
(2) Icepi, Vitória, Brésil
(3) Fiocruz, Rio De Janeiro, Brésil

Context: In a town in the countryside of Brazil, a significant part of the population preserves the Pomeranian dialect as a central element of its cultural identity. In 2023, the Family Health Strategy in primary health care of that locality identified low adherence to hypertension and diabetes treatments among Pomeranian-speaking users. Frequent medication errors and avoidable clinical decompensations were contributing to increased demand for urgent care. After reviewing performance indicators, medical records, and spontaneous patient reports, the team concluded that linguistic barriers were a key determinant of poor medication adherence.

Methods: The experience began in April 2023, following an analysis based on national performance indicators for hypertension and diabetes. Initial data revealed that only 39% of hypertensive patients and 13% of diabetic patients were adequately covered. Recognizing the need for a communication strategy adapted to the local linguistic context, the team developed bilingual medication labels containing simple Pomeranian words and illustrative symbols representing dosage and schedules. The objective was to facilitate understanding, reduce errors, and strengthen the connection between professionals and patients. New evaluations conducted in the first quadrimesters of 2024 and 2025 showed substantial improvement. Adherence coverage increased to 53% for hypertensive patients and 73% for diabetic patients in 2024, reaching 68% and 82%, respectively, in 2025. These results demonstrated the positive impact of the intervention.

Originality: A major strength of the strategy was its low cost and feasibility. All label printing was performed within the primary care unit, without outsourcing or additional financial burden.

Lessons learned and future implication: The bilingual labels improved clarity of communication, reduced the need for repeated explanations, optimized staff time, and decreased medication administration errors. They also contributed to preventing complications and unnecessary hospitalizations wh

Discussion: An important qualitative outcome was the strengthening of trust between the team and the community. By valuing the cultural and linguistic identity of Pomeranian-speaking patients, the intervention fostered inclusion and belonging.

Conclusion: This experience illustrates how integrating cultural and linguistic aspects into primary health care can enhance equity and access. It offers a replicable, culturally sensitive approach for other settings characterized by linguistic diversity.

Corresponding author: Marcella Lima Seibert Grigato, dra.marcellalseibertg@gmail.com

ID 1122- Lexicometric analysis of patients' and physicians' discourse on Lyme borreliosis in France

Karim DEMNATI, José-Philippe MORENO, Cyril MASSELOT

Université Marie Et Louis Pasteur, Besancon, France

Context: Lyme borreliosis remains highly controversial, with many chronic symptoms frequently attributed to it. The gap between patients' narratives and physicians' discourse contributes to diagnostic and therapeutic uncertainty in practice.

Objectives: To quantify, through lexicometric analysis, the discursive distance between patients and physicians regarding Lyme borreliosis, and to understand how these representations are constructed.

Methods: Descriptive qualitative study combining focus groups and semi-structured interviews with chronic-course patients (CCP), general practitioners (GP), other medical specialists (OMS), and Lyme doctors (LD). Transcripts were analysed using IRaMuTeQ, with descending hierarchical classification according to the Reinert method, and co-occurrence mapping based on the Russell-Rao and Jaccard indices.

Results: Thirty-seven participants produced 137,913 occurrences. GPs oscillated between clinical prudence and distrust towards foreign serologies and parts of the pharmaceutical industry, while struggling to maintain an alliance with patients. OMSs relied on serological evidence, diagnostic exclusion strategies and rehabilitation-oriented approaches within guidelines. LDs denounced perceived scientific censorship, built a community-based "counter-expertise", and advocated prolonged antibiotic therapies. CCPs described clusters of polymorphic symptoms, long diagnostic wandering, delegitimising encounters with institutions, and a heavy financial burden, but also gratitude towards physicians who took time to listen and acknowledge uncertainty.

Discussion: The analysis reveals an epistemological fracture in which conventional physicians accept uncertainty and methodically exclude other

etiologies, while LDs group heterogeneous clinical presentations under the label "Chronic Lyme" without a threshold for refutation, providing patients with narrative coherence and recognition. This asymmetry of legitimacy and evidence fuels generalised mistrust, encourages recourse to heterodox pathways and exposes patients to iatrogenic risks and financial vulnerability. Empathic listening, work on "grey zones", and multidisciplinary consultations in primary care emerge as pathways towards reconciliation and safer shared decision-making.

Conclusion: The Lyme borreliosis controversy forms a conflictual ecosystem in which asymmetrical discourses maintain a dialogue of the deaf and undermine trust. Creating encounters between scientific rigour and patients' lived experience could help transform this controversy into a medicine of uncertainty rather than a battlefield.

ID 790- Reducing the Misuse of Antibiotics for pharyngitis with Assertively Rules

Xavier GOCKO, Catherine PLOTTON

Dmg De Saint-Étienne, Saint-Étienne, France

Context: In 2023, According to the WHO, 1/6 of laboratory-confirmed bacterial infections worldwide were resistant to antibiotic treatment. In France, in 2015, the number of multidrug-resistant bacterial infections was estimated at 125 000, and the number of deaths attributed to antibiotic resistance at 5,500. In 2021, France was the fourth-largest consumer of antibiotics. In 2022, (75.5% of prescriptions by general practitioners). Upper respiratory tract infections are very common (e.g. 9 million cases of pharyngitis diagnosed in France each year) and are particularly affected by inappropriate prescribing and misuse of antibiotics. Multimodal interventions targeting clinicians, including educational programs on both knowledge and communication skills, have shown positive effects on the quality of prescriptions. In this context, an interactive, serious game was developed (RAMPAR), featuring emotional immersion based on situations of antibiotic misuse in adult pharyngitis, using biomedical data and communication skills (based on assertivity) for french general practioners.

Objectives: Evaluate the impact of RAMPAR on antibiotic prescriptions for pharyngitis in adults at 12 months.

Methods: The RAMPAR study is an interventional, pragmatic, comparative, randomized study conducted among general practitioners. This study is funded by the Interregional Primary Care Research Call for Projects - ReSP-Ir.

Results: Primary endpoint: Overall antibiotic prescription rate for patients aged 16 to 65 years old, Pay for Perfomance-P4P indicator at 12 months. Secondary endpoints: Overall antibiotic prescription rate for patients aged 16 to 65 years old, P4P indicator at 24 months.

Discussion: An average overall antibiotic prescription rate for patients aged 16 to 65 of 27.2% was observed in 2022 (P4P indicator). The target set by the P4P is 20%. Therefore, our intervention will be relevant if it reduces the overall average antibiotic prescription rate to at least 20%. With the following assumptions: average rate of 27.2% without intervention vs. 20% with intervention, for an alpha risk of 5% and a power of 85%, it is necessary to include 253 physicians per group, or 506 in total. This calculation was made using the biostatgv website.

Conclusion: This 36-month project aims to improve general practioner-patient communication and maintain the relationship; reduce the misuse of antibiotics in adult pharyngitis and combat antibiotic resistance.

ID 389- Language Support Patterns and Clinical Needs of Foreign Residents in Japan: Insights From a Multilingual Medical Hotline

Yuka MATSUMURA [1] , Kotoe SATOH [2], Yoneyuki KOBAYASHI [2], Hiroko MORI [3], Junji HARUTA [4]

(1) Keio University School Of Medicine, Tokyo, Japon
(2) Amda International Medical Information Center, Tokyo, Japon
(3) Center For General Medicine Education, Keio University School Of Medicine, Tokyo, Japon
(4) Medical Education Center/center For General Medicine Education, Keio University School Of Medicine, Tokyo, Japon

Context: Japan's rapidly increasing foreign resident population continues to face substantial barriers in accessing healthcare. Clarifying their language-related and clinical needs is essential for improving primary care accessibility.

Objectives: To identify nationality-specific (1) language-support patterns in a multilingual medical consultation hotline and (2) barriers to accessing healthcare.

Methods: We conducted a retrospective descriptive study using FY2021–2024 records from a non-profit multilingual hotline in Japan. "Easy Japanese" (simplified Japanese for non-native speakers) and English were available daily, while other languages were offered once or twice weekly. Analyses were limited to consultations from foreign residents.

Results: Among 4,297 total consultations, 2,987 (69.5%) were from foreign residents representing 82 nationalities. The top 10 nationalities accounted for 65% of cases, with notable increases from Chinese and Vietnamese callers. (1) Language-support patterns: Of 2,987 consultations, 1,751 (58.6%) were made directly by individuals and 1,236 (41.4%) by proxies such as family, friends, or healthcare facilities. Language-use analyses focused on self callers only. Language use varied markedly by nationality. English was used in >95% of consultations from English-speaking nationalities. Despite limited service days, >70% of Chinese, Brazilian, Vietnamese, and Peruvian callers received mother-tongue support. When unavailable, these groups shifted more to Japanese than to English. Among nationalities without mother-tongue support, some relied predominantly on Japanese (e.g., Nepal), whereas others depended on English (e.g., Bangladesh). (2) Barriers to accessing care: Three consultation purposes—medical facility information, interpretation requests, and facilities offering care in "Easy Japanese"—accounted for ~80% of calls. Interpretation requests were minimal among English-speaking nationalities (0–8%) but exceeded 25% among Chinese, Brazilian, and Vietnamese callers, with >40% initiated by healthcare facilities. Requests for "Easy Japanese" care were especially frequent among Vietnamese (24.5%), Brazilian (15.1%), and Chinese (12.4%) callers. Clinical specialty needs also varied: psychiatry was more common among Chinese and U.S. callers, whereas obstetrics/gynecology and pediatrics were more frequently requested by South and Southeast Asian callers.

Discussion: Our findings demonstrate that healthcare systems must adopt flexible, multi-tiered strategies—incorporating mother-tongue services, English, and "Easy Japanese"—to address diverse communication needs among foreign residents.

Conclusion: Flexible, multilayered — rather than uniform — language-support models are essential to improve healthcare access for foreign residents.

ID 144- Healthcare professionals' perceptions of professional interpreting in ambulatory care: a qualitative study in the Pays de la Loire region

Raphaëlle BIGOT [1] , Emeline ODWAZNY [1], Charlotte DESCHAMPS [1], Rosalie ROUSSEAU [2]

(1) Nantes, Nantes, France
(2) Dmg Nantes, Nantes, France

Context: The language barriers is a major obstacle to accessing healthcare. To address this issue, on-site and telephone professional interpreting services were introduced in 2017 in the Pays de la Loire region of France.

Objectives: This study explores healthcare professionals' perceptions of these services within ambulatory care settings.

Methods: A qualitative study was conducted using focus groups and semi-structured interviews with community-based healthcare professionals who had previously used interpreting services. Participants were recruited by email based on program activity records. Data were analyzed thematically, and categories were derived from emerging themes. An explanatory model was developed through integrative analysis and illustrated in a diagram.

Results: Seventeen healthcare professionals participated (13 general practitioners, 2 midwives, and 2 speech therapists) through two focus groups and five individual interviews. Participants reported improvements in communication, the therapeutic relationship, and intercultural understanding, identifying interpreting as a versatile tool well suited to medical consultations. Its use was progressively integrated into daily practice and associated with both professional and personal satisfaction. However, structural and organizational barriers limited broader implementation. Additional challenges—such as longer consultation times, concerns about added complexity, and fears of disrupting the therapeutic relationship—were also reported.

Discussion: Professional interpreting appears to act as a catalyst for more humanistic and culturally responsive care. It strengthens patient–provider communication and supports vulnerable populations, while encouraging greater awareness of intercultural dynamics in medical practice.

Conclusion: Professional interpreting enhances communication safety and strengthens the therapeutic relationship, thereby helping to reduce healthcare inequalities. Broader adoption, adequate financial support, and increased awareness among healthcare professionals are essential to ensure the long-term sustainability of these services.

ID 92- Impact of Patient Communication Style on AI-Generated Clinical Advice in Family Medicine E-Care

Mahmud OMAR [1] , Gorenshtein ALON [2], Agbareia REEM [3], Nadkarni GIRISH [2], Klang EYAL [2]

(1) Maccabi Healthcare - Tel Aviv, Tel Aviv, Israël
(2) Mount Sinai Medical Center, New York, États-Unis
(3) Hadassah Medical Center, Jerusalem, Israël

Context: Generative and agentic artificial intelligence systems are being tested to assist physicians in managing patient e-messages. In family medicine, these tools could ease workload but may also inherit human-like communication biases. Patient tone and wording are known to influence clinicians, yet their effect on AI models remains largely unexplored.

Objectives: To examine how patient communication style affects AI-generated decisions for clinical e-messages and sick-leave requests in family medicine.

Methods: We developed 500 standardized patient e-messages covering common family-medicine problems and sick-leave requests, validated by two family physicians. Each message retained identical clinical content but was rewritten in eight communication styles (like neutral, urgent, emotional, threatening..) and processed by five large language models using identical prompts. Structured outputs captured clinical decisions like triage urgency and medication choice for clinical messages, and other ouputs for sick-leave requests. Statistical differences from the neutral control were assessed using chi-square tests with false-discovery-rate correction and Cramér's V for effect size.

Results: Communication style significantly altered model behaviour. Threatening, urgent, and demanding messages prompted markedly higher rates of same-day-clinic recommendations (+37–51 percentage points; $V = 0.40–0.69$, $p < 0.001$), fewer self-care or routine visits, but shorter follow-ups (fewer 1–2-week reviews, more 24-hour advice; $V \approx 0.39$). Models also issued more prescriptions under directive tones. In sick-leave requests, threatening language reduced approval rates (–7.6 pp) and granted days (–0.22 days; $p < 0.001$), while emotional language elicited slightly more lenient and empathetic replies.

Discussion: Agentic LLMs appeared to mirror patient tone. Assertive or hostile messages seemed to lead to more resource-intensive outputs—such as

urgent visit recommendations, shorter follow-ups, and increased prescribing—while emotional messages may have encouraged more empathetic responses. These patterns resemble behavioural tendencies previously observed in human clinicians.

Conclusion: These tone-driven patterns may mirror those seen in human clinicians, but the magnitude of change in LLMs appears larger. As such models may soon operate autonomously, they could be vulnerable to intentional or unintentional prompt manipulation. We assume that growing public awareness of how LLMs respond to tone could amplify this risk. Recognising and mitigating linguistic bias will be essential before these systems are integrated into everyday family medicine communication.

Comorbidity

ID 2159- More Than the Sum of Diagnoses : What the OECD PaRIS survey Reveals About Multimorbidity in Primary Care

Candan KENDIR [1] , Nicolas LARRAIN [2], Michael VAN DEN BERG [2], Chema VALDERAS [3], Dionne KRINGOS [1], Niek KLAZINGA [1]

(1) Amsterdam Umc, Amsterdam, Pays-Bas
(2) Oecd, Paris, France
(3) National University Health System, Singapore, Singapour

Context: Multimorbidity is now the norm rather than the exception in primary care practice, challenging disease-centred models of care . While family doctors routinely manage patients with multiple chronic conditions, health systems still lack internationally comparable evidence on how multimorbidity affects patient-reported health outcomes and experiences. The OECD Patient-Reported Indicator Surveys (PaRIS) address this gap by placing patients' voices at the centre of quality assessment, with a specific focus on people living with chronic conditions in primary care.

Objectives: The study addresses how distinct multimorbidity profiles relate to patient-reported physical health, mental health, and well-being; to what extent do individual factors (polypharmacy, healthcare utilisation, continuity of care relationship, symptom burden, and confidence to self-manage) alter these associations between patient-reported outcome measures and multimorbidity profiles and whether these associations vary systematically across sociodemographic groups, by age, gender, income, and education.

Methods: PaRIScollected data from over 107 000 patients aged 45 and over in 1 800 primary care practices across 19 countries in 2023-2024, by using the PaRIS Patient Questionnaire. The multimorbidity analyses focus on respondents reporting two or more chronic conditions which are regrouped into five multimorbidity profiles. Outcomes include patient-reported physical health, mental health and well-being. The association between the outcomes and explanatory variables are assessed using multi-level analysis, given the nested structure of PaRIS (patients in practices, which are in countries).

Results: The results will be available at the time of the conference. They will include physical health, mental health and well-being scores among people with five different multimorbidity profiles. It will also show the influence of utilisation of healthcare (primary care, emergency care or hospital care), polypharmacy, confidence in self-management and continuity of relationship on the relationship between multimorbidity profiles and patient-reported outcomes.

Discussion: The discussion will focus on the comparison with existing literature and policy and practice recommendations in primary care.

Conclusion: Increasing number of people living with chronic conditions call for further actions on the reorganisation of primary care delivery and practice. The results of this work will provide actionable information on the management of multimorbidity in primary care practices.

ID 1545- Assessment of comorbidity burden and medication adherence in patients with type 2 diabetes

Yusuf GORGULU, Elbi HUSEYIN, Ozcan FATIH

Manisa Celal Bayar University, Manisa, Türkiye

Context: Many people with type 2 diabetes also have other health conditions. The literature states that about 90% of these people have at least one additional condition. These health issues increase the overall disease burden, or comorbidity, making it harder for patients to perform daily activities and follow their treatment plans.

Objectives: This study aimed to investigate the relationship between comorbidity burden, medication adherence, and quality of life in patients with type 2 diabetes mellitus.

Methods: This cross-sectional study was conducted among patients with type 2 diabetes who visited Family Health Centers in Manisa Province. Data were gathered using the Sociodemographic Data Form, Weighted Functional Comorbidity Index, Medication Adherence Report Scale, and the SF-12 Quality of Life Scale.

Results: A total of 201 patients with type 2 diabetes participated in the study. The average age was 58.99±11.09 years, with 103 participants (51.2%) aged 60 or older. Being 60 or older, female gender, obesity, low income and education levels, and low physical activity were associated with higher comorbidity burdens. Patients taking multiple oral antidiabetic drugs (OADs) or a combination of OAD and insulin therapy had higher medication adherence scores. A weak-to-very weak but statistically significant negative correlation was observed between the Weighted Functional Comorbidity Index and the Physical Components Score, the Mental Components Score, and the medication adherence scores. As the Physical Components Score, Mental Components Score, and medication adherence scores increased, the comorbidity index decreased.

Discussion: This study, in line with existing research, found that higher comorbidity burden negatively affects medication adherence. A 2022 study by Doya et al. revealed that type 2 diabetes patients with additional health conditions were twice as likely to adhere to their medications compared to those without.

Conclusion: It was demonstrated that comorbidity burden increases with age in diabetic patients. Additionally, a higher comorbidity burden is associated with lower medication adherence. Furthermore, increased comorbidity burden adversely affects both the physical and mental aspects of quality of life. Overall, this study emphasizes the importance of a holistic approach in the assessment and management of patients with type 2 diabetes mellitus.

ID 631- Co-existing asthma and gastroesophageal reflux and their impact on adolescent quality of life in rural Sri Lanka

Hana RUFEROVÁ [1] , Mohamed I M SHUJA [2], Aara C A THILFAR [3]

(1) Senecio S.r.o., Prague, Tchèque, république
(2) Faculty Of Medicine And Allied Sciences, Rajarata University Of Sri Lanka, Mihintale, Sri lanka
(3) So/paediatrics-Ashraff Memorial Hospital, Kalmunai, Sri lanka

Context: Asthma and gastroesophageal reflux disease (GERD) are common chronic conditions in early adolescence and frequently present with overlapping respiratory and gastrointestinal symptoms. In low-resource settings, these interactions lead to avoidable morbidity and reduced participation in school and daily activities. Understanding these associations is essential to strengthen equitable and humanistic adolescent care in primary healthcare systems.

Objectives: To determine the prevalence of asthma and GERD among early adolescents, assess associations between asthma and gastrointestinal symptoms, GERD and respiratory symptoms, and evaluate the impact of GERD on health-related quality of life (HRQoL).

Methods: A school-based cross-sectional study was conducted among adolescents aged 13–14 years in six randomly selected schools in Anuradhapura District. Asthma and GERD were

assessed using the validated ISAAC questionnaire and GerdQ. Health-related quality of life (HRQoL) was measured using the PedsQL 4.0 inventory. Logistic regression was used to examine associations between asthma, GERD, and related symptoms.

Results: A total of 1,127 students participated (response rate 99.5%; mean age 13.6 years; 44.8% male). Prevalence of current asthma was 16.1%, and GERD symptoms were present in 17.1%. A significant association was observed between asthma and GERD (AOR 2.3, 95% CI 1.6–3.3, p<0.0001). Gastrointestinal symptoms—including heartburn (32.0%), upper abdominal pain (26.5%), regurgitation (21.5%), and nausea (19.9%)—were significantly associated with asthma (all p<0.0001). GERD was associated with wheezing (38.1%), nocturnal dry cough (54.0%), difficulty breathing (21.8%), and chest tightness (23.3%) (all p<0.0001). Adolescents with GERD had significantly lower total HRQoL scores (75.3 ± 13.2) compared to those without GERD (82.0 ± 10.8; p<0.0001), with impairments across physical, emotional, social, and school functioning.

Discussion: Co-existing asthma and GERD markedly increase both respiratory and gastrointestinal symptom burden and substantially reduce HRQoL. These overlapping presentations represent an under-identified clinical challenge in adolescent primary care.

Conclusion: Integrating early screening for GERD in adolescents with asthma and for asthma in those with GERD can improve symptom control and support a more equitable, humanistic approach to adolescent healthcare.

ID 265- association of morbidity patterns with risk of cardiovascular events and medical consumption among patients with chronic kidney disease: a nationwide cohort study

Hui ZHAO, Song JIA

The Department Of Health Management, Center Hospital Of Dalian University Of Technology, Dalian, Chine

Context: Comorbidity is extremely common in the chronic kidney disease (CKD) population. The in-depth exploration of the comorbidity patterns in CKD patients and analysis of the differences in medical consumption corresponding to different comorbidity combinations are of great significance for optimizing clinical diagnosis and treatment strategies and rationally allocating medical resources.

Objectives: To achieve precise classification of CKD patients, conduct an in-depth investigation into the differences in medical consumption among various clustered groups, and provide a scientific basis for optimizing the allocation of medical resources and formulating personalized intervention plans for CKD patients.

Methods: This study used data from the China Health and Retirement Longitudinal Study (CHARLS) database, including 1,693 participants with CKD. Through k-means cluster analysis of 18 chronic diseases, to identify comorbidity clusters with significant clinical heterogeneity. Cox regression model was used to explore the association between the clustered groups and the incidence of cardiovascular event.

Results: This study identified three clusters. The fully adjusted Cox regression analyses indicated that compared with Cluster 1, Cluster 2 had a hazard ratio (HR) of 1.60, and Cluster 3 had an HR of 2.69, suggesting the highest of new-onset cardiovascular events in Cluster 3. The results of the logistic regression model indicated that, compared to Cluster 1, for hospital stays, the odds ratio (OR) was 1.75 for Cluster 2 and 2.43 for Cluster 3, while for doctor visits/outpatient visits, the OR was 1.78 for Cluster 2 and 1.50 for Cluster 3. These findings confirm that the number of hospitals stays for Clusters 2 and 3 is significantly higher than that for Cluster 1, and the frequency of hospital stays, as an important component of medical consumption, further reflects the differences in medical resource utilization among the three clusters.

Discussion: The findings underscore the importance of classifying CKD patients by comorbidity clusters for precise risk stratification, highlighting the potential of targeted interventions

tailored to each cluster's representative disease features to improve prognosis and optimize medical resource allocation, and serving as a healthcare strategy for high-risk CKD populations.

Conclusion: CKD patients could be divide to three distinct comorbidity clusters with significant heterogeneity in clinical characteristics and outcomes.

ID 60- Subclinical Hypothyroidism and Risk of Chronic Kidney Disease : A Systematic Review and Meta-Analysis

Paolo Augusto ROMERO MERINO [(1)] , Carlos VALLADARES [(2)], Stefanni VIVANCO [(3)], Jenny Alejandra ZABLAH [(4)], Brigida TUEROS [(5)], Rommel PORTILLA [(6)], Sebastian VEGA [(7)], Jia EE CHIA [(8)]

(1) Hospital Clínico Universitario Of Valladolid, Valladolid, Espagne
(2) University Of Miami Miller School Of Medicine, Miami, États-Unis
(3) Universidad De San Martin De Porres, Lima, Pérou
(4) Universidad Tecnológica Centroamericana, Tegucigalpa, Honduras
(5) Universidad Nacional Federico Villareal, Lima, Pérou
(6) Universidad De Las Americas, Quito, Équateur
(7) Universidad Peruana Cayetano Heredia, Lima, Pérou
(8) University Health Science Center, El Paso, États-Unis

Context: Subclinical hypothyroidism (SCH), defined by elevated thyroid-stimulating hormone with normal free thyroxine, is common in adults and has been linked to adverse renal outcomes. However, the extent to which SCH increases the risk of incident chronic kidney disease (CKD) remains uncertain.

Objectives: To evaluate whether subclinical hypothyroidism is associated with an increased risk of incident chronic kidney disease in adults , through a systematic review and meta-analysis.

Methods: A systematic review was conducted in accordance with PRISMA 2020 guidelines. Multiple databases were searched for studies evaluating the association between SCH and CKD. Five studies including over 4 million patients met inclusion criteria. A random effects meta-analysis was performed to to estimate pooled risk ratios (RR) for CKD incidence. Risk of bias was evaluated using ROBINS-I.

Results: Pooled analysis showed that SCH was associated with a higher risk of CKD (RR 1.19, 95% CI: 1.10–1.29). Moderate heterogeneity was observed (I^2 = 48.9%). Sensitivity analyses confirmed the robustness of findings, and no major publication bias was detected on funnel plot analysis.

Discussion: These findings suggest that SCH confers an approximately 20% higher relative risk of developing CKD. The association persisted across diverse populations and study designs , reinforcing a potential causal link mediated by renal hemodynamic changes, endothelial dysfunction , or low-grade inflammation. Recognizing thyroid function as a renal risk factor could enhance early screening strategies and preventive interventions in primary care.

Conclusion: SCH is associated with an increased risk of CKD. Our findings suggest that thyroid status may be a relevant factor in renal risk assessment and highlight the need for prospective trials to determine whether early identification and management of SCH can modify CKD outcomes.

Continuity of care

ID 1269- Continuity of care & referral patterns

Karl Oskar BJÖRKMAN [(1)] , Eva ARVIDSSON [(2)], Sofi FRISTEDT [(3)]

(1) Region Jönköpings Län, Vetlanda, Suède
(2) Region Jönköpings Län, Jönköping, Suède
(3) Jönköping University, Jönköping, Suède

Context: Continuity of care (CoC) is linked to better outcomes and lower downstream use, yet continuity has declined in some settings. How continuity and primary-care coverage relate to referral behaviour at clinic level remains under-

reported. In XXX, we evaluated whether higher continuity and greater primary-care coverage are associated with lower outgoing referral propensity and fewer rejected referrals.

Objectives: (1) Test associations between clinic-level CoC, primary-care coverage, and (a) outgoing referrals and (b) rejected-referral share. (2) Examine structural correlates (centre size, contact intensity). (3) Produce risk-standardised referral rates for fair benchmarking.

Methods: Cross-sectional, centre-level analysis (year 2021) linking administrative files in XXX. Exposure: clinic CoC index (0–1) and primary-care coverage (share of all visits in primary care). Outcomes: outgoing referrals per 1,000 listed patients and rejected-referral share. Models: Poisson GLM with offset log(list size) for counts (IRR), Binomial GLM for rejected-referral share (OR), and Negative Binomial GLM to compute risk-standardised referral rates (RSR). Partial correlations adjusted for size and activity. N≈40 matched centres.

Results: Higher CoC correlated with fewer referrals (r≈−0.40 to −0.44). In count models, CoC predicted lower referrals (IRR≈0.993 per +1 pp; ~6–7% fewer per +10 pp). Coverage correlated negatively with referral propensity (r≈−0.33). CoC was associated with a lower rejected-referral share (OR≈0.989 per +1 pp). Larger centres had lower CoC; RSR identified clinics referring above/below expected given list size and contact mix. Findings were direction-consistent after adjustment.

Discussion: Continuity and coverage appear to shape referrals at clinic level. Mechanistically, relational continuity likely reduces precautionary/duplicative referrals and improves referral acceptability. Scaling pressures threaten continuity, suggesting design countermeasures (empanelment, micro-teams). Limitations include cross-sectional design, centre-level CoC, and incomplete case-mix adjustment.

Conclusion: In XXX, higher CoC and stronger primary-care coverage are associated with fewer outgoing referrals and fewer rejections. Preserving continuity while scaling—supported by RSR benchmarking—may reduce avoidable specialist demand and administrative rework.

ID 1278- Breaking the chain: innovative collaborative care for families beyond fragmented pathways

Vincent PUITE

De Zoed Haarlem Zuid, Haarlem, Pays-Bas

Context: Traditional healthcare for children and families with complex needs often follows an “estafette model,” where responsibilities are passed from one professional to another. This fragmented approach delays effective support and leaves families navigating complex systems alone. The Wijkwijs project introduces an innovative, neighborhood-based model that integrates general practitioners, pediatricians, youth health physicians, neighborhood social support team, and physiotherapists into one collaborative team.

Objectives: To evaluate Wijkwijs as a care innovation that replaces fragmented pathways with integrated collaboration. The study examines whether families experience improvements across four domains—physical, psychological, social, and existential—and whether the integrated team contributes to clearer, more effective support. It also explores how professionals perceive the added value of working together in a shared responsibility model.

Methods: A mixed-methods design is used. Quantitative data are collected through a 4D registration tool at intake and six-month follow-up, alongside questionnaires on health, stress, quality of life, and parenting burden. Qualitative insights are gathered through family interviews and professional focus groups. Analyses include pre–post comparisons and thematic coding of experiences.

Results: To date, 21 families have been included. Early findings indicate that families experience greater clarity in care, reduced fragmentation, and improved communication across involved professionals. Preliminary follow-up data show notable improvements in the physical and social domains, alongside reduced parental stress.

Families report that the team understands the full context of their situation and provides timely, coordinated responses that address underlying concerns rather than isolated symptoms. Professionals describe increased satisfaction, quicker decision-making, and deeper insight into each other's expertise. Challenges around logistics and documentation remain but are manageable within the collaborative structure.

Discussion: Wijkwijs shows early promise as a care innovation that replaces sequential responsibility transfer with true multidisciplinary collaboration. Preliminary results suggest improved family functioning, stronger continuity of care, and positive professional experiences.

Conclusion: These insights will guide further refinement, inform local policy, support scaling to other neighborhoods, and enrich practice-oriented publications.

ID 880- How historical views on continuity of care shape the identities of current and future general practitioners

Annemoon JONKER [1] , Rianne VAN DIEPEN [2], Anne DE LA CROIX [1], Marianne MAK-VAN DER VOSSEN [1], Jettie BONT [1], Esther DE GROOT [2], Otto MAARSINGH [1]

(1) Amsterdam Umc, Amsterdam, Pays-Bas
(2) Umc Utrecht, Utrecht, Pays-Bas

Context: Continuity of care (CoC) is globally recognized as a central value of general practice as it improves health outcomes for patients. Although many general practice curricula acknowledge the importance of CoC, general practice trainees often feel unprepared to deliver it. This suggests a need to better understand how CoC is constructed within the profession and how this shapes what trainees perceive as expected from them.

Objectives: To understand how historical and contemporary ways of talking about CoC shape the professional identities of current and future GPs, and what this means for how trainees learn to enact CoC in practice.

Methods: We conducted a Foucauldian discourse analysis of policy documents, publications in medical journals and national newspapers (1959–2025) to map the historical discourses through which GPs have talked about CoC. Tracing the development of these discourses allowed us to analyze how their implicit assumptions persist and shape how CoC is understood in present-day general practice.

Results: Four CoC discourses were identified: 1 CoC as a moral ideal (North Star), 2. CoC as a long term- and trusting relationship (Cradle-to-Grave), 3. CoC as a system-based effort (Interlocking Systems), and 4. CoC as an entity in decline or lost (Crisis). While each discourse has surfaced at different moments in history, they have now accumulated and coexist.

Discussion: This study illustrates that discourses on CoC have been constructed in multiple ways and have accumulated over time. These coexisting discourses promote multiple, and sometimes incompatible, identity expectations: from moral agent to always-available caregiver, from system-oriented team player to change agent or powerless bystander. This accumulation creates an environment in which GP trainees must reconcile competing demands, making the formation of a coherent professional identity challenging.

Conclusion: Recognizing how language shapes CoC can help educators teach it as a living, adaptive practice, enabling GP trainees to take ownership and align CoC with their personal and professional identity.

ID 682- Role of a general practitioner in the illness of patients with persistent somatic symptoms: perception, experience, expectations of the patients

Martin SEIFERT [1] , Adriana CHROMÁ [2], Jaromír KABÁT [3], Marek ABU RAS [4], Eliška CÍSAŘOVÁ [5], Antonín ŠEBELA [6], Tim OLDE HARTMAN [7]

(1) Division Of General Practice, 3rd Faculty Of Medicine, Charles University, Prague, Tchèque, république
(2) Institute For Clinical And Experimental Medicine, Prague, Tchèque, république
(3) Psychosomatic Clinic In Prague, Prague, Tchèque, république
(4) Hospital Of Mělník, Prague, Tchèque, république
(5) University Hospital Královské Vinohrady, Prague, Tchèque, république
(6) National Institute For Mental Health, Prague, Tchèque, république
(7) Department Of Primary And Community Care Of The Radboud University Medical Center In Nijmegen, Nijmegen, Pays-Bas

Context: Patients with persistent somatic symptoms (PSS) account for 20–30% of patients in general practice and can be very burdensome for doctors. Czech general practitioners (GPs) use an original Czech primary care guideline on functional disorders and PSS (2023). Furthermore, Czech GPs can get extra psychosomatic education. Yet, there has been no research focusing on patients with PSS in primary care in the Czech Republic.

Objectives: The aim of our study was to explore the experience of patients with PSS with their GPs, their perception of the role of the GPs and their expectations.

Methods: We performed individual in-depth semi-structured interviews with 30 patients with PSS (n=30). GPs chose 21 patients who were coming repeatedly to their office with PSS lasting for at least 3 months, with small probability to find a clear organic explanation of the symptoms in the perception of the GP. We used purposive sampling of the GPs, when we included 18 GPs with and without psychosomatic education, from different regions, urban and rural, males and females, younger and older. In the second branch, we recruited 9 patients who come to a psychosomatic clinic in Prague for consultations for PSS lasting at least 3 months. We performed manual reflexive thematic analysis of the interview transcripts.

Results: Our on-going analysis identified the most frequently recurring themes: first-contact doctor, importance of the explanation, relationship with the GP, doctor´s active interest in patient´s life, importance of language/expressions, psychological support, assessment of the results, management of the abnormal findings including those with no significance.

Discussion: Our findings are mostly consistent with the literature. However, in some topics we will bring a deeper insight.

Conclusion: The study shows that GPs can play a crucial role in the illness of patients with PSS. Patients are focused on the organic nature of their difficulties and expect solutions from their GP in various forms. A deeper relationship build on mutual trust can help patients to accept bio-psycho-social explanations of their symptoms. We therefore consider it important to focus on GPs' training in psychology and communication, which could help them to achieve shared understanding even with these patients.

ID 600- Chronic disease management in the vulnerable elderly: the importance of an individualized approach – a case report

Diana PINTO [1] , Daniela SILVA [1], Rita AMARAL [2], Isabel GRAÇA [2], Ana Margarida CRUZ [1]

(1) Usf Bom Porto, Uls Santo António, Porto, Portugal
(2) Usf Aníbal Cunha, Uls Santo António, Porto, Portugal

Context: Managing chronic diseases in older adults is a growing challenge in primary care (PC). Multimorbidity, functional decline, and social vulnerability frequently compromise treatment adherence. These interacting factors increase the risk of decompensation, preventable adverse events, and loss of autonomy. An individualized and patient-centred approach, integrating health education, medication review, and social support, is therefore essential.

Methods: An 80-year-old woman with insulin-dependent type 2 diabetes, hypertension, obesity, chronic kidney disease, chronic coronary syndrome, depressive disorder, and chronic osteoarticular pain. She lived alone in precarious housing with limited social support. She had poor adherence, frequently missed follow-up appointments, and struggled to

manage her medication. She presented poor glycaemic control (peak HbA1c 12.8%; occasional glucose >500 mg/dL) and recurrent metabolic decompensation, leading to several unscheduled consultations and emergency visits. Home visits by the PC team revealed that she lived almost entirely confined to one room due to physical limitations, with inadequate hygiene and a highly unbalanced diet mainly composed of soft drinks and industrial porridges. These observations were key to tailoring an appropriate plan. The intervention included glycaemic monitoring, medication reconciliation, activation of social services, and strengthened family involvement. The patient agreed to move in with her daughter, resulting in progressive clinical improvement and adequate glycaemic control within months (HbA1c 8.6%). Strengths and limitations: Strengths included longitudinal follow-up and contextual assessment through home visits. Limitations included difficulty assessing potential cognitive decline and ensuring consistent engagement.

Originality: Although multimorbidity and poor adherence in older adults are well described, this case highlights how home visits and individualized assessment of social and environmental factors can reshape management and lead to measurable improvement, an approach un

Lessons learned and future implication: Understanding environmental and social determinants is crucial when managing older adults. Early identification of vulnerability, integration of home visits, and structured involvement of family and social services may prevent avoidable complications.

Discussion: This case illustrates how isolation, precarious living conditions, and multimorbidity significantly impair adherence. Tailored intervention improved stability and outcomes.

Conclusion: PC teams are crucial for safe and effective chronic disease management in vulnerable elderly. Individualized strategies contribute to better disease control and quality of life.

ID 477- Improving the quality of palliative care: is continuity of care the key?

Puck HOITINGA, Eva BOLT, Roeline PASMAN, Otto MAARSINGH

Amsterdam Umc, Amsterdam, Pays-Bas

Context: Ideally, a general practitioner (GP) and their team know their patients well and follow their care pathways within both primary care and other healthcare settings. This is called continuity of care (COC). Although COC is a core value of general practice - with benefits including fewer hospital admissions, reduced healthcare costs, and better quality of life - it has shown a sharp decline in the Western world over the past decades. Moreover, it is expected COC will further decline in the future due to fragmentation and changes in availability of care. Given the decline in COC, there is a risk that patients with complex or less predictable illness trajectories experience inequities in access to coherent, person-centred care at the end of life. In the Netherlands, most palliative care takes place in a primary care setting, and there is little evidence on how patients in the palliative phase experience and value COC.

Objectives: Our study explores the perspectives of palliative patients on COC across three illness trajectories: cancer, heart failure, and multimorbidity.

Methods: We conduct a longitudinal interview study with approximately 20 patients in the palliative phase (identified by a negative answer to the surprise question) across the three illness groups to capture their experiences and perceptions of continuity of palliative care, supplemented with the Nijmegen Continuity of Care Questionnaire and the Patient Satisfaction Index. We will analyze the data using thematic analysis.

Results: Data collection and analysis are ongoing. The first results that we present at the conference will focus on initial interviews conducted with patients.

Discussion: Topics discussed in the interviews include availability of care, coordination and

oversight, and transfer of information between different care providers.

Conclusion: To estimate the value of COC in palliative care and come to practical recommendations, it is crucial to investigate patients' perspectives on COC at the end of life. This study will contribute to a deeper understanding of COC in the primary care setting at the end of life in different illness trajectories.

ID 75- Rethinking continuity in general practice for people with mesothelioma: a qualitative case study

Emilie COUCHMAN [1] , Steph EJEGI-MEMEH [2], Sarah MITCHELL [1], Clare GARDINER [2]

(1) University Of Leeds, Leeds, Royaume-Uni
(2) University Of Sheffield, Sheffield, Royaume-Uni

Context: Continuity in UK general practice has clear benefits but is difficult to achieve. The 2025-26 GP Contract advocates for incentivised identification of people who may particularly benefit from continuity, for example those with a terminal illness. Mesothelioma is an incurable disease caused by asbestos exposure and people with this diagnosis potentially derive significant benefit from continuity. However, there is little research exploring continuity in general practice for these individuals.

Objectives: This study aimed to provide detailed understanding of the experiences of continuity in UK general practice among people with mesothelioma, their close persons, and their healthcare professionals (HCPs); how they achieve this (or not); and how it affects their healthcare service use.

Methods: Qualitative data obtained from longitudinal interviews with people with mesothelioma, their close persons, and their HCPs, was used to construct detailed case studies. Reflexive thematic analysis was undertaken. Five individuals participated in a patient and public involvement capacity.

Results: Data from 54 interviews formed nine case studies. Findings are presented in relation to five overarching themes: 1) People with mesothelioma experience unique challenges in achieving continuity; 2) Patient/close person capacity to facilitate continuity in general practice; 3) HCP capacity to facilitate continuity in general practice; 4) MDT approach differs from traditional family doctor model; and 5) 'NHS general practice is broken'.

Discussion: Despite its well-evidenced benefits, continuity is under-represented in UK general practice service design, contract, and policy. Participants described the intense burden of living with and dying from a rare cancer with a poor prognosis, exposure-related legal and financial complications, and a lack of awareness among the public and HCPs. Ultimately, the needs of people with mesothelioma may not be addressed if they are not supported by both relevant mesothelioma-focused services, and generalist services that can provide holistic care. Integration and continuity are imperative.

Conclusion: This research deepens understanding of continuity in general practice for people with mesothelioma, with a specific focus on their ability to achieve continuity. Although focused on people with mesothelioma in the UK, findings are relevant to other international patient populations, particularly those with other rare conditions or palliative care needs.

Dermatology & headaches

ID 1927- Measles or Monkey pox

Dragan GJORGJIEVSKI

Centar For Family Medicine , Pzu D-R Dragan Gjorgjievski, Skopje, Macédoine du Nord, République de

Context: Monkeypox is a viral zoonotic disease caused by the monkeypox virus. It can be transmitted from animals to humans, from humans to humans, and from contaminated environments to humans.

Methods: A 41-year-old male, divorced with one daughter, initially presented with sore throat, myalgia, malaise, fever (up to 38.5°C), and cough. Examination revealed pharyngeal hyperemia and bronchitic pulmonary sounds, and laboratory tests showed leukocytosis, neutrophilia, and elevated CRP (55 mg/L). He was treated with clarithromycin twice daily for 10 days.One week later, he developed a rash on the neck, initially resembling urticaria. The patient had eaten mushrooms for the first time the day before. Initial treatment included sinopen, urbazone, and loratadine. The rash rapidly progressed to medallion-shaped lesions and generalized eruptions, prompting referral to dermatology. An initial diagnosis of pityriasis rosea was made, and topical corticosteroids were prescribed.The rash continued to evolve, presenting with vesicles, macules, and pustules. Infectious workup for syphilis, gonorrhea, and HIV was negative. Laboratory findings included lymphopenia, thrombocytopenia, leukocytosis, elevated IL-6, and increased IgE. Skin biopsy confirmed Pityriasis Lichenoides et Varioliformis Acuta (PLEVA). Treatment was adjusted to clindamycin three times daily and topical corticosteroids. Seven months later, during routine follow-up (as the patient is a pilot), antibodies to monkeypox were detected, suggesting a possible subclinical or atypical viral trigger.

Originality: This case is unique due to the unusual progression of skin lesions, evolving from urticaria-like eruptions to pityriasis rosea–like plaques and finally to vesiculopustular lesions, which is rarely reported. The combination of histopathologically confirmed

Lessons learned and future implication: Progressive, polymorphic rashes may reflect immune-mediated or post-infectious processes, not just allergies. Awareness of emerging viral triggers and a multidisciplinary approach are crucial for accurate diagnosis and patient safety.

Discussion: This case highlights polymorphic skin eruptions evolving from urticaria to vesiculopustular lesions. PLEVA was confirmed by histopathology and supported by immunological abnormalities indicating systemic immune dysregulation. Retrospective monkeypox antibodies suggest a possible atypical viral trigger.

Conclusion: Recognition of monkey pox clinical and dermatological aspects facilitates its diagnosis and differentiation from other viruses which cause similar skin rashes, particularly Smallpox and Chickenpox.

ID 1850- Physicians´ experiences of Teledermatology in public primary care- A qualitative focus group study

Cristina SANDU-BLENDEA [(1)] , Ingmarie SKOGLUND [(2)], Tanja FRANSSON [(3)], Lena NORDEMAN [(4)]

(1) Region Västra Götaland, Primary Care, Närhälsan Jourmottagning Online, Sweden, Gothenburg, Suède
(2) Research, Education, Development & Innovation, Primary Health Care, Region Västra Götaland, Sweden School Of Public Health And Community Medicine, Institute Of Medicine, Sahlgrenska Academy, University Of Gothenburg, Sweden., Gothenburg, Suède
(3) Research, Development, Education And Innovation Primary Healthcare, Regions Västra Götaland, Sweden, Gothenburg, Suède
(4) 1) Research, Development, Education And Innovation Primary Healthcare, Regions Västra Götaland, Sweden. 2) Department Of Health And Reabilitation, Inst. Neuroscience And Physiology, University Of Gothenburg, Sweden, Gothenburg, Suède

Context: Teledermatology (TD) is increasingly used in public care to facilitate the assessment and management of skin lesions through digital healthcare visits. By enabling patients to submit images of skin conditions for a remote evaluation, TD has the potential to improve access to specialist expertise and streamline care pathways. However, previous research indicates that physicians may experience uncertainty regarding diagnostic accuracy and clinical decision-making when assessing skin lesions digitally, highlighting a need for deeper understanding of clinicians´ experiences.

Objectives: The aim of this study is to explore physicians' experiences of assessing skin lesions during digital healthcare visits in public primary care.

Methods: A qualitative study design will be employed using focus group discussions. Data was collected through five to six sessions, each comprising four to six physicians working in digital public primary care. Participants had experience using teledermatology, in digital consultations. The focus group discussions explored perceptions of diagnostic confidence, clinic usefulness, challenges and educational needs related to digital assessment

of skin lesions. Data were analyzed using a systematic qualitative content analysis in accordance with the methodological framework described by Dahlin-Ivanoff and Holmgren.

Results: The study is expected to generate in-depth knowledge of psysicians´perceptions of teledermatology, including perceived benefits, limitations and sources of diagnostic uncertainty. Findings are anticipated to identify key factors influencing clinical decisions-making, professional confidence and perceived patient safety in digital dermatology consultations. We will have analyzed the data and will present the results at the conference.

Discussion: This study provides insights into how teledermatology is perceived and used in everyday clinical practice. The findings will highlight both the potential of teledermatology to support clinical work and the challenges physicians encounter when assessing skin conditions without physical examination.

Conclusion: By elucidating physicians´experiences of digital assessment of skin lesions, this study may contribute to the development of more affective teledermatology practices, targeted educational interventions and improved digital primary care services for patients seeking care for skin-related conditions.

ID 1769- Closing the follow-up gap after trigger point interventions in tension-type headache and migraine: a systematic review for primary care

Valerija MIZAVCOVA [(1)] , Vlodeks GROMAKOVSKIS [(2)]

(1) Faculty Of Residency, Riga Stradiņš University, Riga, Lettonie

(2) Pain Medicine Unit, Neurology Department, Association Of Health Centers, Medical Center Elite, Riga, Lettonie

Context: Tension-type headache (TTH) and migraine are frequent reasons for consultation in primary care. Myofascial trigger point (MTrP)-directed procedures may provide short-term symptom relief, but evidence on durability is limited. Continuity in primary care offers an opportunity for longitudinal follow-up to track outcomes and support timely escalation or referral.

Objectives: To summarise randomised evidence on changes in headache frequency and intensity after MTrP-directed interventions in adults with International Classification of Headache Disorders (ICHD)-defined TTH or migraine, and to translate findings into practical primary care implications for follow-up, referral, and equity in longitudinal headache monitoring.

Methods: The protocol was prospectively registered in PROSPERO (CRD42025641133). Eight databases were searched for randomised controlled trials (RCTs) published 2004–2024 (updated November 2025). Two reviewers independently screened and selected studies, extracted data, and assessed risk of bias using RoB 2. Narrative synthesis was undertaken due to substantial clinical and methodological heterogeneity.

Results: Seven RCTs (451 participants; predominantly TTH) were included. Interventions included lidocaine trigger point injections, dry needling, and botulinum toxin type A injections applied to clinically identified active MTrPs. Short-term reductions in headache intensity were consistent (typically 1.5–2.5 points on a 0–10 scale). Improvements in headache frequency were most evident in chronic TTH; evidence in migraine was limited. Follow-up was short (4–12 weeks), with variation in protocols and outcome timing, limiting conclusions on durability and comparative effectiveness. Risk of bias was limited by blinding and reporting limitations.

Discussion: The main evidence gap is limited follow-up duration. Primary care can help close this gap through structured, person-centred monitoring of headache days, pain intensity, acute medication use (including risk of medication overuse), and individual functional goals, with clear triggers for escalation or referral within a stepped-care pathway. Making this follow-up routine in primary care may help reduce inequities in access to ongoing assessment and timely specialist input.

Conclusion: MTrP-directed procedures may offer short-term improvement in headache intensity and, in chronic TTH, headache frequency for selected patients with prominent myofascial features. Future standardised trials should include longer, primary care–relevant follow-up and consistent outcome

time points to determine sustained benefit and inform practical care pathways.

ID 1300- Migraine treatment in general practice: adherence to guideline recommendations using routine care data

Karin HEK [(1)] , Marianne HEINS [(1)], Anke LAMBOOIJ [(2)], Gisela TERWINDT [(3)], Jako BURGERS [(4)]

(1) Nivel, Utrecht, Pays-Bas
(2) Dutch Institute For Rational Use Of Medicine, Utrecht, Pays-Bas
(3) Leiden University Medical Center, Utrecht, Pays-Bas
(4) Dutch College Of General Practitioners, Maastricht University, Maastricht, Pays-Bas

Context: Migraine is a common condition often treated in general practice. The Dutch GP guideline includes treatment recommendations.I It is unknown whether these are followed.

Objectives: How often do GPs see patients with migraine, and do they follow treatment recommendations?

Methods: We used data from electronic health records (EHR) in general practices participating in the Nivel Primary Care Database in 2023. We selected patients with a migraine episode (ICPC-code N89). We assessed the number of contacts with the GP, prescribed medication, and referrals to secondary care. In a selection of newly diagnosed patients, we assessed 5-year care trajectories using data from 2019 to 2023.

Results: Data from 25,474 patients with migraine from 389 general practices were available. In 2023, 19 per 1000 adults in the Netherlands had a migraine episode registered in their GP's EHR. 80% of these patients were women, and 86% between 18 and 64 years of age. Half of the patients with migraine contacted the GP in 2023. One out of five patients did not have GP contacts in the 5 years after diagnosis. In line with the guideline, the most prescribed acute medications for migraine were triptans (54%), and NSAIDs (26%). The most commonly prescribed preventive medications were betablockers (16%). 16% received an opioid prescription, whereas these are advised against in the guideline. More than a third of women 18-44 years received hormonal anticonceptives, which is not recommended. Care trajectory analyses showed that opioids and anticonceptives were mostly started before the migraine diagnosis, indicating these might not be related to migraine. Almost one out of ten patients with migraine received a referral to secondary care, mostly in the first half year after diagnosis.

Discussion: Medication use is underestimated as over-the-counter medication could not be assessed.

Conclusion: Patients with migraine do not often contact the GP for their migraine, whether this is due to e.g. adequate coping, or limited perceived burden is unknown. A minority receives preventive medication and is referred to secondary care, the latter most likely for diagnosis. Whether the treatment is effective for these patients remains to be studied. Reducing opioid prescribing deserves attention.

ID 1148- Effectiveness of Honey-Based Dressings for Wound Healing in Primary Care: A Systematic Review and Meta-Analysis

Arnila MELINA [(1)] , Mohd. Fikra Tri WIJAYA [(2)]

(1) University Of Muhamadiyah North Sumatra, Medan, Indonésie
(2) University Of Riau, Pekanbaru, Indonésie

Context: Wound care is an important part of family medicine, particularly in settings where resources are limited and advanced dressings are not always accessible. Honey-based dressings are commonly used in community and primary-care settings, but their effectiveness in this context has not been fully reviewed.To our knowledge, no prior meta-analysis has focused specifically on the performance of honey-based dressings within primary-care settings.

Objectives: To synthesise contemporary evidence on the effectiveness, safety, and cost-efficiency of honey-based dressings for wound care in primary-care and community settings, supported by meta-analysis.

Methods: This systematic review adhered to PRISMA guidelines. Comprehensive searches of PubMed, Embase, Scopus, Cochrane CENTRAL, and

regional databases identified randomized and comparative studies published up to March 2025. Two reviewers independently performed study selection and data extraction, with discrepancies resolved by consensus. Risk of bias was assessed using the Joanna Briggs Institute (JBI) Critical Appraisal Tools. Primary outcomes included healing time, wound-area reduction, infection clearance, pain, adverse events, and treatment costs. A random-effects meta-analysis was conducted, and heterogeneity was quantified using I^2 statistics.

Results: Twenty-three studies (12 RCTs; 11 observational) met the inclusion criteria. Honey-based dressings demonstrated significantly faster healing (mean difference −7.89 to −26.37 days), greater wound-area reduction (18–28%), and markedly higher infection clearance rates for burn wounds (OR 10.80). Several diabetic-foot-ulcer studies reported meaningful reductions in pain. Honey-based dressings were associated with a 20–50% reduction in treatment costs and no serious adverse events. Moderate heterogeneity was noted across wound types and honey formulations; however, pooled estimates consistently favoured honey.

Discussion: Honey-based dressings show clear clinical benefits, are generally safe, and can reduce overall treatment costs. Their easy availability and suitability for home care make them a practical choice in primary-care settings. These features fit well with the principles of family medicine and may help lessen care gaps in low-resource communities.

Conclusion: Honey-based dressings represent an effective, safe, and low-cost wound-care solution suitable for routine use in primary care. Incorporating honey into standard wound-care protocols may accelerate healing, reduce clinic burden, and expand equitable access to quality care. These findings support consideration of honey dressings as a first-line option in general practice, particularly in resource-limited environments.

ID 316- The natural history of headache in Canadian family practice: a cross-sectional and longitudinal study from DELPHI

Hüsna SARICA ÇEVIK, Thomas FREEMAN, Bridget RYAN, Moira STEWART

Centre For Studies In Family Medicine, Department Of Family Medicine, Schulich School Of Medicine & Dentistry, Western University, London, Ontario, Canada

Context: Symptoms are a significant part of family physicians' workload, accounting for about two-thirds of encounters in Canada. Headache is among the most common reasons for encounter (RFE), and understanding its evolution and chronicity is crucial.

Objectives: To determine the prevalence of headache in family practice and identify patient characteristics associated with persistent/recurrent symptoms and with short-term presentations.

Methods: This study is part of a larger study of 12 common symptoms in family practice. A retrospective cross-sectional study of visits and a retrospective cohort study with longitudinal follow-up were conducted in southwestern Ontario using the DELPHI Electronic Medical Record database, based on ICPC-2-R coding. Patients with a new headache RFE were followed up to four years and assigned to 1 of 3 pathways: (1) Headache Remained: symptoms did not fit a diagnostic category and either persisted or resolved without further attention. (2) Headache Continued after Diagnosis: Headache placed in a diagnostic category, but patient continued to present the symptom as an RFE. (3) Diagnosis was made, and no subsequent headache visits occurred.

Results: Headache appeared in 254 encounters (1.7% of all visits). Of those, 81% were under 64 years; 81% were female; 31% had prior psychological conditions. Among 110 patients in the longitudinal analysis, 41% followed pathway 1 (85% having only one visit). 22% followed pathway 2 (mean episode of care of 14 months and 3.2 visits); all were prescribed medication, 92% were female, 58% had prior psychological conditions; the most common diagnoses were migraine (28%), anxiety (15%), and tension headache (11%). 36% followed pathway 3.

Discussion: Longitudinal findings indicate that new headache presentations resulted in three clinical trajectories. A smaller subgroup, often women with comorbid anxiety or depression, requires attention to psychosocial determinants and access to non-pharmacological approaches to prevent progression to chronic or analgesic-related headache.

Conclusion: Headache remains a common RFE in family practice. Most patients without alarming symptoms can be reassured and treated accordingly. While many cases resolve quickly, a subset follows a persistent trajectory, particularly among younger women. These findings highlight the importance of an individualised approach and attention to psychosocial contributors in primary care.

(2) Faculty Of Physical Culture, Palacky University Olomouc, Olomouc, Tchèque, république
(3) Department Of Human Movement Studies, University Of Ostrava, Ostrava, Tchèque, république
(4) School Of Health & Medical Sciences, City St George's University Of London, London, Royaume-Uni
(5) Diabetes Research Centre, University Of Leicester, Leicester, Uk, Leicester, Royaume-Uni
(6) Center Of Advanced Technologies, Faculty Of Science, University Of Hradec Kralove, Hradec Kralove, Tchèque, république

Context: Low levels of physical activity remain a major challenge in managing prediabetes and type 2 diabetes in primary care. While brief advice from general practitioners (GPs), including self-monitoring, can be effective, its impact is often limited by time constraints and lack of follow-up. Digital tools, including mobile health (mHealth) adaptive messaging, may extend behavioural support into daily life.

Objectives: To examine whether adding adaptive digital support to wearable-based self-monitoring leads to meaningful long-term changes in physical activity and related health outcomes in adults with prediabetes or type 2 diabetes in primary care.

Methods: ENERGISED was a 12-month pragmatic multicentre randomised trial in 28 general practices in the Czech Republic. Adults with prediabetes or type 2 diabetes (n = 343) were allocated to an intervention combining wearable self-monitoring, context-sensitive text messages and six-month phone counselling, or to an active control with wearable self-monitoring and brief GP advice. The primary outcome was change in daily steps at 12 months; secondary outcomes included activity patterns, mental health, quality of life, functional performance and cardiometabolic markers. Mixed models for repeated measures were used.

Results: After 12 months, changes in daily step count were comparable between groups, indicating no additional effect of adaptive digital support on overall activity volume (between-group difference 309 steps/day; 95% CI −299 to 917). Short-term benefits were observed at 6 months, when the intervention group showed a more favourable activity intensity distribution and better mental health scores than the control group. These differences diminished after counselling ended and were not significant at 12 months. No differences were found for cardiometabolic outcomes, and adverse events were rare.

Discussion: These results suggest that adding adaptive digital messaging to self-monitoring provides limited additional benefit in usual primary care. Transient effects during counselling highlight the importance of human support in behaviour change. Further research is needed to determine how digital and human components can be optimally combined for sustainable outcomes.

Conclusion: In real-world primary care, supplementing self-monitoring with adaptive messaging and brief counselling had only transient effects on activity intensity and mental health. These findings suggest that sustained behaviour change may require hybrid models integrating digital tools with human support.

ID 1302- The Impact of E-Health Integration on the Chronic Care Model in Diabetes Management in Primary Care: A Scoping Review

Elif Sidal GULTEKIN, Evin Deniz ORHAN, Alisan RATAZ, Huseyin ELBI

Manisa Celal Bayar University, Manisa, Türkiye

Context: Type 2 diabetes is one of the most managed chronic diseases in primary care and requires continuous follow-up. Improving patients' self-management skills, ensuring regular follow-up, and encouraging lifestyle changes directly influence the quality of primary diabetes care. Recently, e-health tools such as telemonitoring, mobile health apps, digital education modules, and message-based reminders have become more prevalent in supporting patients' chronic care. The Chronic Care Model (CCM) provides an evidence-based framework for organizing effective chronic disease management. However, how health tools are integrated into type 2 diabetes care and their relationship to the chronic care model still remain unclear.

Objectives: This scoping review aims to present current evidence on the effectiveness of eHealth interventions in managing type 2 diabetes and their alignment with the core components of the chronic care model.

Methods: A review was conducted using PubMed, Scopus, Embase, the Web of Science, CINAHL, and the Cochrane Library, including studies published between 2010 and 2025. Clinical trials, reviews, and meta-analyses were searched using terms such as “type 2 diabetes,” “primary care,” “digital health,” “telemonitoring,” “mobile health,” and “Chronic Care Model.” Data were charted and summarized using a scoping review approach, and the findings were mapped to the six components of the Chronic Care Model.

Results: eHealth applications used in primary care diabetes management mostly engage with self-management support components and clinical information systems. Conversely, interaction with the decision support component is more limited, and the literature provides little information on integration with community resources and health system organization.

Discussion: E-health interventions are recommended to enhance patient engagement in care and improve information exchange within primary care teams. However, challenges and limitations persist in using these technologies, such as disparities, digital literacy issues, and physical barriers.

Conclusion: E-Health applications closely align with the components of the Chronic Care Model, especially self-management support and clinical information systems.

ID 1242- Perceptions of people living with diabetes and healthcare professionals towards AI-assisted screening in the English NHS Diabetic Eye Screening Programme

Lakshmi CHANDRASEKARAN [(1)] , Charlotte WAHLICH [(1)], Umar CHAUDHRY [(1)], Kathryn WILLIS [(1)], Royce SHAKESPEARE [(1)], Ryan CHAMBERS [(2)], Louis BOLTER [(2)], John ANDERSON [(2)], Christopher G OWEN [(1)], Alicja R RUDNICKA [(1)]

(1) Department Of Population Health & Policy, School Of Health And Medical Sciences, City St George’s, University Of London, London, Royaume-Uni
(2) Homerton Healthcare Nhs Foundation Trust, London, Royaume-Uni

Context: The Diabetic Eye Screening Programme (DESP) in the National Health Service (NHS) in England generates approximately 18 million retinal images per year, which are graded for diabetic retinopathy. Automated retinal image analysis using Artificial Intelligence (AI) can detect diabetic retinopathy as accurately as human graders, but it is not yet licensed in England. Understanding perceptions among People Living with Diabetes (PLD) and Healthcare Professionals (HCP) is essential for successful implementation.

Objectives: This study explored attitudes and concerns towards AI-assisted screening and how these vary across sociodemographic groups.

Methods: A mixed-methods design combined quantitative and qualitative data from two online surveys co-developed with PLD and HCP focus groups. The surveys were distributed across DESPs, diabetes charities, and professional networks between September and December 2023. Likert-scale responses were analysed using linear

regression to identify subgroup differences. Free-text responses were coded thematically using a co-developed framework.

Results: 1,577 PLD and 262 HCP completed the surveys; 387 PLD (24%) and 98 HCP (37%) provided free-text comments. Both groups generally viewed AI integration as inevitable and potentially beneficial for efficiency and cost-saving, with concerns around data security, accountability for AI errors, and reduced human interaction. Qualitative themes included trust, workforce impact, patient–practitioner relationships, and implementation challenges. Quantitative analysis showed that 58% of PLD believed AI would perform equally well across different ages and ethnicities, compared with 32% of HCP. Most PLD (81%) felt humans should remain responsible for screening outcomes, and 71% of HCP disagreed that AI could wholly replace human grading. Females were less accepting of AI, while PLD of Black and Asian ethnicities expressed greater concern about data security and impact on screening experience. HCP of Asian ethnicity were generally more sceptical of AI's role.

Discussion: Both PLD and HCP recognise the potential benefits of AI-assisted screening, but express concerns around safety, responsibility, and workforce implications. Limited understanding of AI's role in the DESP is a key barrier to acceptance.

Conclusion: Targeted outreach activities based on socioeconomic factors can build trust in future AI implementation into the DESP. These activities could include co-designed educational materials with transparent communication around the role of AI, data use, and safety.

ID 1232- Primary Care Screening for PDAC in New-Onset Diabetes

Adriana-Larisa MATEI [(1)] , Carmen BUSNEAG [(2)]

(1) Carol Davila University Of Medicine And Pharmacy, Bucharest, Roumanie
(2) Spiru Haret University, Bucharest, Roumanie

Context: Pancreatic cancer stands for one of the most fatal malignancies, featuring a subtle onset, aggressive behavior, and a poor prognosis. Among the top 5 causes of cancer-related deaths in the U.S., pancreatic cancer is the only cancer without a clear, systematic approach to early diagnosis. New-onset diabetes (NOD) has emerged as a potential early clinical manifestation of PDAC, offering a possible window for targeted screening. Because most new diabetes diagnoses occur in primary care, this setting represents a pivotal point for initiating risk assessment and early-detection pathways.

Objectives: To evaluate current evidence supporting NOD as a risk group for pancreatic cancer and to outline a primary care–centered screening framework that balances risk, feasibility, and resource use.

Methods: We conducted a scoping review by searching PubMed for relevant studies published in the past 10 years. Our keywords included "new onset diabetes", "pancreatic cancer", "screening". We included meta-analysis, observational studies and systematic reviews. We identified 14 studies that met our inclusion criteria.

Results: Studies show that adults ≥50 with NOD have an elevated short-term risk of PDAC, with risk peaking in the first 2–3 years of diabetes onset. Clinical indicators such as unintentional weight loss, rapidly worsening glycemia, personal history of pancreatitis, and family history of PDAC significantly improve risk stratification and can be readily assessed in primary care. Incorporating structured risk scores and algorithmic triggers into electronic health records may help identify a small subset of NOD patients whose risk is high enough to warrant further evaluation. Emerging blood-based biomarkers and machine-learning models show promise for future integration into primary-care workflows but require prospective validation.

Discussion: In primary care, where most new diabetes diagnoses originate, clinicians can use routine data—such as weight trends, glycemic trajectories, and relevant medical history—to flag patients who may benefit from further evaluation. Although imaging remains essential for definitive assessment, its selective use guided by risk stratification improves efficiency and reduces unnecessary testing.

Conclusion: As tools for identifying high-risk NOD patients evolve, the primary care setting will play a central role in coordinating screening, educating patients, and ensuring timely referral pathways.

ID 293- Hemoglobin Levels and the Risk of Microalbuminuria Among Type 2 Diabetics Visiting A Primary Healthcare: A Retrospective Study in XXX

Jumanah JARAD [(1)] , Abdulelah ALSHANGITI [(1)], Manal ALFAHMI [(2)], Saeed ALQAHTANI [(3)]

(1) Family Medicine Resident, Dhahran, Arabie Saoudite
(2) Public Health Administration, King Abdullah Medical City, Saudi Arabia, Makkah, Arabie Saoudite
(3) Family Medicine Consultant, Dhahran, Arabie Saoudite

Context: Albuminuria is an early marker of diabetic kidney disease, indicating silent renal damage. With rising diabetes-related kidney complications in Saudi Arabia, early detection is crucial. This study assesses the prevalence of albuminuria and examines its association with hemoglobin levels and other risk factors in patients with type 2 diabetes.

Objectives: To assess the prevalence of albuminuria in type 2 diabetes, identify its clinical and biochemical predictors, and examine the association with hemoglobin levels.

Methods: This retrospective cross-sectional study included adults with type 2 diabetes with measured Urinary Albumin-to-Creatinine Ratio levels , receiving care at XXX in the last 5 years. Analyses used R software (version 4.4.1). Continuous variables are shown as mean ± SD and categorical as frequency (percentage). Results are expressed as odds ratios (OR) with 95% confidence intervals (CI). Statistical significance was set at $p < .05$ for adjusted odds ratios (aOR).

Results: Among 15,822 patients with type 2 diabetes, 19.6% had microalbuminuria and 5.4% had macroalbuminuria. Albuminuria severity was associated with older age, higher systolic blood pressure, longer diabetes duration, elevated HbA1c, worse lipid profile, reduced eGFR, and hypertension. A graded increase in anemia prevalence was observed across albuminuria categories (32.2% normo-, 40.6% micro-, 55.6% macroalbuminuria).

Discussion: Albuminuria severity was independently associated with older age, hypertension, higher systolic blood pressure, longer diabetes duration, poor glycemic control, elevated triglycerides, and former smoking, consistent with regional and international studies. Notably, our study identified a novel graded relationship between low hemoglobin levels and increasing albuminuria severity, suggesting anemia may serve as an early marker of renal vulnerability. Strengths of the study include its large, heterogeneous population and inclusion of all albuminuria stages, while limitations include its cross-sectional design and the lack of other hematological assessments. These findings emphasize the importance of monitoring both traditional risk factors and hemoglobin to prevent progression of diabetic kidney disease.

Conclusion: Anemia may serve as an early marker for the severity of albuminuria in patients with type 2 diabetes. Primary care physicians should routinely monitor hemoglobin, along with other biomarkers, to help prevent the progression of diabetic kidney disease.

ID 452- Primary Care Practitioners (PCPs) Perspectives on Obesity and Diabetes Prevention.

Aidai SHARSHEKEEVA [(1)] , Attila SARVARY [(2)]

(1) University Of Debrecen, Bishkek, Kirghizistan
(2) University Of Debrecen, Debrecen, Hongrie

Context: The escalating global epidemics of obesity and type 2 diabetes (T2DM) pose a severe threat to public health, with lower-middle-income countries like Kyrgyzstan facing a disproportionately high burden. Primary care is recognized as the crucial frontline for prevention, yet significant barriers often hinder its effectiveness in resource-limited settings.

Objectives: This study aimed to comprehensively assess the role, barriers, and opportunities related to obesity and diabetes prevention within the primary care system of Kyrgyzstan.

Methods: A qualitative, exploratory study based on grounded theory was conducted in 2025. Thirteen

family physicians (12 female, 1 male) with a mix of urban and rural practices in Northern Kyrgyzstan were recruited. Data were collected via semi-structured interviews, which were transcribed, translated, and analyzed using axial coding to identify central categories and their relationships.

Results: The analysis identified a central issue: the ineffective prevention and management of obesity and diabetes. Several key themes emerged, including patient-related barriers, systemic obstacles, contextual challenges, a lack of institutional support, compensatory strategies, and negative consequences. This situation was primarily driven by several causal factors, including a critical shortage of specialists, such as endocrinologists and dietitians, financial barriers faced by patients, and low public awareness about these health issues. These challenges were further exacerbated by overwhelming physician workloads and deeply ingrained cultural dietary habits. In response to these pressures, physicians, constrained by a lack of government assistance and a patient mindset that often places health responsibility elsewhere, resorted to compensatory strategies. These included taking on extra duties and focusing health education efforts on younger, more receptive audiences. However, these measures ultimately resulted in late-stage diagnoses, physician burnout, and a continued failure of the preventive health system.

Discussion: Kyrgyzstan's primary care physicians are constrained by systemic and sociocultural barriers, resulting in a reactive care model unlike more integrated systems elsewhere.

Conclusion: There is an urgent need for systemic interventions to address specialist shortages, reduce physician workload by transferring competencies and involving other health specialists in primary health care, and implement supportive policies. Strengthening the primary care system is essential to unlock its preventive potential and curb the growing epidemic of obesity and diabetes in Kyrgyzstan.

ID 315- Guideline concordance in diabetes care at Singapore's National University Polyclinics

Lay Hoon GOH, Wilson TAM, Stephanie VAN DER LUBBE, Jose M VALDERAS

National University Of Singapore, Singapore, Singapour

Context: Care that is concordant with clinical practice guidelines improves the quality and outcomes of chronic disease management. A new ratio model was recently developed to measure patient-level guideline concordance using electronic health records (EHRs) by considering patients' past clinical activities and their timings (that is, past clinical trajectories). This patient-level approach offers significant clinical advantages over previous broad-based approaches. We applied the ratio model to a cohort of patients with type 2 diabetes mellitus (T2DM) in primary care clinics in XXX.

Objectives: To examine the distribution of patients' individual concordance scores for T2DM clinical indicators and identify individual-level predictors of concordance for patients at XXX's primary care clinics.

Methods: XXX EHRs from 2018–2020 were analysed for 49,621 patients with T2DM. Concordance scores were calculated for eight clinical indicators using the ratio model. Concordance scores from the ratio model ranged from 0 (not concordant at all) to 1 (perfect concordance). Multivariate regressions were used at the patient level to assess associations between concordance and patient characteristics such as age, sex, ethnicity, HbA1c control, and comorbidities.

Results: Patients' mean age was 64.8 years (SD 11, range 23-105). There were 24,628 (49.6%) females. Blood pressure monitoring, serum low-density lipoprotein cholesterol, and glycated haemoglobin had higher mean concordance scores (mean 0.94, SD 0.17 for blood pressure monitoring), while foot and retinal assessments had lower concordance scores (mean 0.37, SD 0.42 for retinal screening). Compared to females, males had lower odds of concordant blood pressure monitoring (OR 0.78, 95% CI 0.72—0.84), and higher odds of urine albumin-creatinine ratio measurements (OR 1.12, 95% CI 1.07–1.16).

Discussion: The ratio model can be used to track patients' concordance over time and to study associations between concordance and health outcomes. Concordance scores can also be used to support clinical decision by triggering alerts for

physicians when the scores exceed a pre-determined threshold. A limitation of the ratio model is the additional data needed for the calculations.

Conclusion: The ratio model measures individual patients' concordance to chronic disease clinical guidelines. It has the potential to assist physicians in making more individualised clinical decisions for patients with chronic diseases.

(3) Chair Of Didactics And Educational Research In Health Science, Faculty Of Health, Witten/herdecke University, Witten, Allemagne
(4) General Practice I I And Patient-Centeredness In Primary Care, Insitute Of General Practice And Primary Care, Faculty Of Health, Witten/herdecke University, Witten, Allemagne

Context: In Germany, health care delivery is shifting toward ambulatory settings, while medical education remains oriented toward inpatient care. This structural mismatch threatens the sustainability of the German health care system. The challenge is pronounced in general practice (GP), where workforce projections indicate a shortage driven by demographic change, physician retirements, reduced working hours, and rising care demands. Without targeted reforms, comprehensive primary care provision—especially in rural regions—cannot be ensured.

Methods: The project conceptualizes a decentralized medical degree program that places GP-care at the core of the curriculum. The project is designed as a medical program conducted at a rural site in Germany. From the first semester onward, students participate in longitudinal placements in GP, fostering professional identity formation, continuity of care and close integration into the local community. During the clinical phase, these experiences are complemented by structured block rotations in regional hospitals and ambulatory specialty practices, ensuring comprehensive clinical exposure while maintaining a focus on GP. To guarantee equivalence with established medical programs, students complete the national state examinations. Student selection within the project follows a predictor-based approach that considers academic performance alongside motivation for GP, rural affinity, and regional background.

Originality: Rather than supplementing a hospital-centered program with isolated ambulatory rotations, the proposed model systematically embeds training within a rural region and integrates regional health care structures as continuous learning environments.

Lessons learned and future implication: The curriculum addresses challenges of the German health system by integrating prevention, health promotion, public health, digital health, telemedicine, artificial intelligence and gender-sensitive medicine. Teaching formats are evidence-based, student-c

Discussion: In the light of the current developments in Germany, a dedicated medical education project has been initiated to realign undergraduate medical training in Germany with the realities of ambulatory and rural health care.

Conclusion: By creating additional study places, strengthening regional training networks, and facilitating a seamless transition into postgraduate training, the project aims to make a sustainable contribution to securing high-quality primary care in Germany.

ID 1686- Collaborative Online Education - Strengthening General Practice Teaching in Germany and Europe

Sinan DURANT, Marie KOENIG, Anna MILLENAAR, Sara VOLZ-WILLEMS, Fabian DUPONT, Johannes

JAEGER

Zentrum Allgemeinmedizin Universität Des Saarlandes, Homburg, Allemagne

Context: The decentralized structure of Germany's final-year (PJ) general practice rotations often results in uneven teaching quality - especially in rural and remote settings. Departments frequently lack resources for full digital curricula. We developed PJ-Teaching, an inter-university online seminar series based on German National College (DEGAM) competencies. This supplements local teaching, ensures longitudinal learning regardless of location, and enables universities to share high-quality sessions - reducing workload while enriching the curriculum.

Objectives: Our goal is to ensure equitable, high-quality general practice education for all students, irrespective of their placement site, by fostering inter-university collaboration. The approach especially enhances the feasibility and attractiveness of rural placements by pooling expertise, supporting small departments, and reducing isolation.

Methods: The programme is coordinated through a shared online platform (website) by a student assistant and post doctorate staff. The participating universities (Marburg, Frankfurt, Hannover, Brandenburg, Jena, Münster, Dresden, Oldenburg, Mainz, Erlangen, Saarland, Charité Berlin, DEGAM) independently schedule interactive seminars featuring case studies and workshops. Teaching quality is measured through standardized student evaluations. Continuous improvement uses the ADDIE instructional-design model, with feedback incorporated into ongoing refinement.

Results: Student engagement remains high; feedback is consistently positive. The format strengthens peer and faculty networking, elevates teaching quality, and broadens reach. Stakeholder inclusion proved to be essential in inter university collaboration. Experienced clinicians lead sessions that offer guidance and inspiration. The decentralized, student-supported structure remains flexible and particularly well-suited remote placements and resource-limited settings. 2025 evaluation data - soon to be presented - demonstrates the model's impact and educational quality.

Discussion: PJ-Teaching delivers accessible, practice-oriented training irrespective of location or institutional resources. It can be a showcase project how digital online teaching and can easily be transferred to an international context. By sharing content and responsibilities, the programme benefits all participating universities and students, enabling sustainable, scalable rural placements.

Conclusion: Our project relates to the core principles of WONCA Europe 2025 in Paris: Liberty: Flexible learning environment for students Equity: Independent from onsite university teaching Fraternity: Collaboration by sharing resources Humanism: Seminars aligning with Can-MED roles

ID 1667- Redesigning a general practice, community health and rural medicine curriculum for medical students: a multi-step project

Felicity GOODYEAR-SMITH [(1)], Ranche JOHNSON [(1)] , Rachel ROSKVIST [(1)], Kyle EGGLETON [(1)], Fabian DUPONT [(2)], Owen MUGRIDGE [(1)], Shomel GAUZNABI [(1)], Elizabeth B PEAT [(1)], Maryann HEATHER [(1)], Komal SRINIVASA [(1)]

(1) University Of Auckland, Auckland, Nouvelle-zélande
(2) Saarland University, Saarbrücken, Allemagne

Context: Increasing student numbers and declining placement availability make our current attachment model for teaching general practice (GP), community health and rural medicine unsustainable at xxx. In 2024 we undertook an international study of medical schools (Phase 1), a literature review, and a series of interactive workshops to clarify our purpose, vision and mission, which provided a conceptual foundation and set of intended outcomes to guide curriculum redevelopment (Phase 2).

Objectives: To redesign our undergraduate curriculum in general practice, community health and rural medicine by addressing four key questions: What does the literature tell us about effective undergraduate GP teaching and learning? How can insights from our international study inform curriculum redevelopment? What can be learned from key stakeholders to strengthen the

redesigned curriculum? How can these learnings be integrated within existing resource and structural constraints?

Methods: International data from 44 medical schools were mapped to the EPIC-GP (Modified SPICES) framework: Electives; Problem-based; Integrated; Community-based; GP-focused; inter-Professional education. EPIC-GP scores were summed, hierarchical cluster analysis performed, and innovations and solutions subjected to content analysis. In 2025 a draft "strawman" curriculum was developed. Extensive stakeholder consultation is underway through surveys and semi-structured interviews using pragmatic sampling of students, university staff, community general practitioners, primary care staff, and national primary care organisations. Data will undergo quantitative and reflexive thematic qualitative analyses.

Results: Three programme typographies emerged from the cluster analysis: hospital-focused, GP-focused and primary care-focused. Five thematic areas of innovations and solutions were identified from content analysis: curriculum organisation; opportunities for student–patient conversations beyond consultations; strategies to provide authentic GP experience; early exposure to GPs as teachers; and use of simulation and information technology. Findings from stakeholder consultations will be presented.

Discussion: In 2026 data from Phases 1–3 will be triangulated to construct a refined draft curriculum which will then undergo a second round of stakeholder consultation, with implementation planned for 2027.

Conclusion: The three phases will provide a coherent, evidence-informed and stakeholder-driven foundation for our curriculum redevelopment. The redesigned programme will align with international best practice, draw on Kern's Six-Step Model of educational theory, and reflect needs and expectations of learners, educators, clinicians and community partners.

ID 1224- Scaling Up Family Medicine: The Regional Diploma Transforming Primary Care in the EMR

Mona OSMAN

American University Of Beirut, Beirut, Liban

Context: The World Health Organization Regional Office for the Eastern Mediterranean (WHO-EMRO) has identified family practice as a cornerstone for strengthening primary health care and achieving Universal Health Coverage (UHC). Despite this priority, countries across the Eastern Mediterranean Region (EMR) face a critical shortage of trained family physicians. In 2016, only 3,225 certified family physicians were available, far below the estimated need of 185,497. Meanwhile, approximately 250,000 general practitioners (GPs) currently provide primary care services, most without formal postgraduate training in family medicine. Building the capacity of this workforce represents the most feasible short-term strategy to expand family practice competencies.

Methods: In response to Regional Committee Resolution EM/RC63/R.2, WHO-EMRO and the Arab Board of Health Specializations (ABHS), in partnership with WONCA-EMR, collaboratively designed a two-year Regional Professional Diploma in Family Medicine (RPDFM). Using a blended learning model, the diploma combines online learning via the Moodle platform with structured face-to-face clinical training. The curriculum spans six thematic modules delivered over 16 instructional blocks. Program development involved stakeholder consultation, curriculum design workshops, competency mapping, and testing of the online learning environment. Implementation began in 2023 with 126 GPs from 10 EMR countries.

Originality: The RPDFM is the first regionally coordinated, multi-agency family medicine training program explicitly designed to upskill in-service GPs at scale. It leverages a unified curriculum, shared standards, and cross-country collaboration to strengthen primary

Lessons learned and future implication: Early experiences show that blended learning significantly enhances accessibility for GPs who cannot leave clinical practice for full-time training. Strong interagency collaboration and country-level support were critical enablers. Challenges included var

Discussion: The RPDFM demonstrates that regionally harmonized training can address workforce gaps in a sustainable, scalable manner. Its

design accommodates national diversity while maintaining competency-based standards. Continued monitoring is needed to assess long-term impact on clinical practice and primary care quality.

Conclusion: The regional diploma represents an innovative and practical solution to strengthening family medicine capacity across the EMR. Scaling and institutionalizing such programs can significantly accelerate progress toward UHC by equipping GPs to deliver high-quality, comprehensive primary care.

ID 633- Global educational program on neuroendocrine neoplasms for primary care physicians: Think NENs

Mehmet UNGAN [1] , David BARTLETT [2], Mark MCDONNELL [3], Dureja SUGANDHA [4], Teodora KOLAROVA [5], Dirk VAN GENECHTEN [6], Christine RODIEN-LOUW [7], James NAGELMACKERS [8], Elyse GELLERMAN [9], Dermot O'TOOLE [10]

(1) Wonca Europe Past President, Ankara, Türkiye
(2) Neuroendocrine Cancer Uk, Leamington Spa, Royaume-Uni
(3) Net Patient Network, Dublin, Irlande
(4) Cnets India, New Delhi, Inde
(5) International Neuroendocrine Cancer Alliance, Boston, États-Unis
(6) Vzw Net & Men Kanker Belgium, Brussels, Belgique
(7) Apted, Lyon, France
(8) Victory Net Foundation, Geneva, Suisse
(9) Net Research Foundation, Quincy, États-Unis
(10) Trinity College Dublin, St James's Hospital, St Vincent's Hospital, Dublin, Irlande

Context: Neuroendocrine neoplasms (NENs) are complex tumors with an increasing global incidence. In 2019, in the Survey of Challenges in Access to Diagnostics and Treatments for NEN Patients (SCAN) there was a mean diagnostic delay of five years worldwide and 46% of patients (1077/2359) were diagnosed at an advanced stage. SCAN also demonstrated that in 19% of cases (456/2359) it was primary care physicians (PCPs) who undertook the initial diagnostic tests. These findings underscore the critical role of PCPs in early NEN detection.

Objectives: To lessen the diagnostic delay, a global team of NEN experts and PCPs, convened by the International Neuroendocrine Cancer Alliance (INCA) in partnership with WONCA Europee developed the Think NENs Global Educational Program, a free, UEMS-EACCME®-accredited e-course designed to equip PCPs with essential NEN knowledge, available in seven languages. The key objectives are to alert to the importance of distinguishing non-specific symptoms from those that require prompt referral for specific dedicated tests to rule out NEN and provide an international map of NEN-related expert groupsm for participants to reach out for specific help.

Methods: The Think NENs Program was evaluated using descriptive statistics. Enrollment and geographical data, and the proportion of PCPs were assessed.

Results: The program consists of three 20-minute core videos covering NEN diagnosis and patient management, delivered through Q&A sessions between PCPs and NEN specialists. Additionally, 13 videos explore key topics. 467 HCPs have enrolled (43% of whom were PCPs) from 79 countries within the first year, with all feedback provided being excellent. This demonstrates considerable interest in the topic.

Discussion: Since no single diagnostic test exists for NENs, early diagnosis depends on PCPs suspecting NENs in patients with relevant unexplained and persisting symptoms. Early diagnosis is possible only if a PCP is aware and thinks about NENs. PCPs are instrumental to reducing time to diagnosis and optimizing care. The Think NENs Program aims to improve patient outcomes through increased PCP awareness of NENs.

Conclusion: Delayed NEN diagnosis and subsequent care remain major challenges worldwide. This collaborative training program is essential for WONCA Europe and WONCA member organizations which may promote this course among their members: https://www.woncaeurope.org/news/view/think-neuroendocrine-neoplasms-%28nens%29-educational-program-for-primary-care-physicians

ID 1208- Innovating rural recruitment: project supporting future general practitioners in underserved regions of the XXX Republic

David HALATA, Katarina JAVORSKA, Ludmila BEZDICKOVA, Lucie SEFRHANSOVA

Czech Society Of General Practice, Prague, Tchèque, république

Context: The shortage of general practitioners (GPs) in rural areas is a growing challenge across Europe. In the XXX Republic, over 40% of GPs are older than 60 years, placing many rural practices at risk of closure. A national project was therefore launched to provide targeted education and structured rural clinical exposure.

Objectives: To identify motivations and barriers influencing early-career doctors interest in rural practice, and to assess whether immersive rural experience can positively shape career intentions.

Methods: A three-year nationwide project Support for education in primary care for general practitioners, paediatric general practitioners, and support for regional accessibility of healthcare (Project registration number: XXX), co-financed by the European Social Fund through the Employment Plus Operational Programme and the state budget of the XXX Republic, was launched by the Institute for Postgraduate Medical Education in 2025. Key components include seminars at all eight XXX medical faculties, support for 26 rural teaching practices offering one-week clerkships for medical students and GP trainees, and a survey evaluating motivations, barriers and the impact of clerkships on career decisions. Regional seminars strengthen peer support and teaching quality.

Results: Across the project, 300 medical students and 150 GP trainees are expected to complete rural clerkships. Early findings indicate a positive shift in attitudes toward rural careers, particularly in perceived autonomy, community engagement and mentorship. Immersive rural exposure appears to reduce concerns about isolation and limited career development. Participants frequently highlight meaningful patient contact and report increased understanding of rural primary care.

Discussion: Evidence supports the importance of early rural exposure in shaping career choices. The project's model combining targeted education, mentorship and real-world experience helps counter misconceptions about rural practice among future GPs.

Conclusion: This EU-funded initiative offers an innovative and scalable approach to rural GP recruitment. By integrating immersive clinical experience with sustained mentoring and evaluation, it reframes rural practice as an attractive and viable career path. The XXX model provides transferable strategies for countries facing similar workforce challenges.

ID 242- Cross-cultural adaptation and validation of the Chinese version of Training Needs Analysis Questionnaire: evident from rural-oriented general practitioners

Xintao HUANG, Huisheng DENG

Chongqing Medical University Affiliated First Hospital, Chongqing, Chine

Context: Chinese general practitioners (GPs) are key to primary healthcare. Continuing medical education (CME)/continuing professional development (CPD) is critical for performance improvement, but existing programs misalign with needs, lacking scientific assessment tools. The globally used Hennessy-Hicks Training Needs Analysis (HHTNA) has no validated Chinese version, with domestic studies relying on unrigorously validated self-designed scales.

Objectives: Translate and cross-culturally adapt the HHTNA to create the Chinese version (Ch-HHTNA); validate its psychometric properties among oriented GPs; provide a scientific tool for Chinese CME/CPD programs and a reference for other developing countries.

Methods: The study was conducted in two phases. Phase 1: Cross-cultural adaptation of the HHTNA questionnaire was completed through forward translation, back-translation, focus group discussions, expert consultation, and pilot testing, following Beaton's guidelines and the modified Delphi method. Phase 2: A cross-sectional study was conducted among 385 oriented GPs in Chongqing. Psychometric properties were validated via item analysis, validity analysis (face validity, content validity, criterion validity, construct validity), and

reliability analysis (Cronbach's α coefficient, split-half reliability), with data analyzed using SPSS 29.0.

Results: Ch-HHTNA includes 37 items across 5 dimensions. Item analysis showed good discrimination (CR>3.0) and homogeneity (CITC≥0.3). Validity met standards: content validity (S-CVI≥0.99), criterion validity (positive correlation between research item scores and engagement), construct validity (5 factors explaining 75.25% variance). Reliability: Cronbach's α 0.797-0.958, split-half reliability 0.932-0.953.

Discussion: The Ch-HHTNA was developed through a standardized process, maintaining the core framework of the original questionnaire while adapting to China's healthcare context, with excellent reliability and validity. The modified Delphi method integrating focus groups and expert consultation enhanced the scientific rigor and efficiency of the adaptation. The results provide data support for targeted CME/CPD program design, but limitations exist: the sample only includes oriented GPs, requiring further validation of applicability; the cross-sectional design cannot track changes in training needs before and after training, and longitudinal studies are needed in the future.

Conclusion: Ch-HHTNA has good reliability and validity, with a 5-factor structure adapting to Chinese GPs' work context. It serves as a reliable tool for assessing oriented GPs' training needs, providing a scientific basis for CME/CPD programs.

ID 422- Perceived Barriers to Parenthood Among Medical Trainees in Tunisia: A National Cross-Sectional Study

Maryam HAJJI [(1)] , Nehla RMADI [(2)], Mounira HAJEJI [(2)], Kaouthar JMAL HAMMAMI [(2)]

(1) Family Medicine Department, Sfax, Tunisie
(2) Occupational Medicine Department, Hedi Chaker University Hospital, University Of Sfax, Sfax, Tunisie

Context: Medical training coincides with peak reproductive years and is marked by high workload, stress, and limited work–life balance. These constraints may hinder the ability of trainees to initiate or pursue a parental project (PP). Understanding how trainees perceive the feasibility of parenthood is essential for designing supportive policies within medical education.

Methods: A national cross-sectional survey was conducted from July to December 2024 among interns and residents in the four Tunisian medical faculties. A structured online questionnaire collected sociodemographic, academic, and medical data, alongside validated measures of work-related quality of life (WRQoL) and physician job satisfaction (PJS). Perceived PP difficulty and related obstacles were assessed. Analyses included descriptive statistics, bivariate tests, multivariate logistic regression, and Random Forest modelling.

Originality: This study is the first national investigation in Tunisia to explore PP feasibility among medical trainees using both classical epidemiological methods and machine-learning modelling. The integration of psychosocial scales with Random Forest predictions o

Lessons learned and future implication: Findings suggest that academic and professional factors—rather than financial or medical ones—are the strongest barriers to PP. This points toward the need for institutional rather than individual-level interventions. Policies such as flexible rotations,

Discussion: Half of Tunisian medical trainees perceive parenthood as difficult during training. Lower home–work interface scores, higher stress, and reduced job satisfaction were strongly associated with PP difficulty, underscoring the influence of the training environment. The predominance of academic constraints across analytical models confirms their central role. These results highlight the need to reframe reproductive choices as shaped by modifiable institutional structures rather than individual limitations.

Conclusion: Academic pressures and poor work–life balance represent major barriers to parenthood among medical trainees. Implementing supportive, flexible, and family-friendly policies is essential to protect trainees' reproductive autonomy and overall well-being.

Corresponding author: Maryam Hajji, hajji_maryam@yahoo.fr

ID 1515- Which place for a personnal life during general medicine residency ? : a mixt study

Maxime PAUTRAT

Faculté Médecine, Tours, France

Context: Medical residents' mental health has declined over the past 15 years, with a feeling of generation gap and too many concessions concerning their personal life. In France, the reform of general medical studies will add an extra year of training starting in 2026, which may contribute to the deterioration of students' mental health.

Objectives: The aim of this study is to describe general medicine residents' satisfaction level at the end of their residency regarding their personal life projects, and to explore their feedback.

Methods: Descriptive quantitative study with an achievment score, followed by qualitative study by semistructured interviews within an interpretative phenomenologic approach. Recrutment between March 2024 and January 2025, in France, involving medical residents within 6 months before or after the end of a 3 years diploma in general medicine

Results: One hundred and twenty-heigt questionnaires were analysed and used. Participants who completed their residency were significantly able to carry out their wedding plan ($p < 0,05$), while those still ongoing residency were significantly able to carry out their travel plan ($p < 0,05$). Twelve interviews were conducted. Participants brought up the best ("happy") and worst ("difficult hardships") moments during their residency. They wished they hadn't interrupted some of their projects ("feeling of waste"), suffered from a social jet lag ("gap between their life and yours") and endured distance from their relatives ("you feel homesick"). They entrusted their need of a "fair balance" between personal and professional life. A new version of themself emerged at the end of their residency : a 2.0 me ("it helps you grow and evolve").

Discussion: Among the limitations is the reluctance of students in suffering to respond, as they do not have the courage to discuss their personal lives.

Conclusion: Medical residency seemed to interfere both in a confrontational and rewarding manner between two spheres of life, giving rise to a rich emotional experience among the participants. Finding a work-life balance might impact the well-being and the number of caregivers, and therefore the population's access to healthcare.

Corresponding author: Maxime Pautrat, maxime.pautrat@univ-tours.fr

ID 905- Professional fulfillment in primary care: a qualitative study of 'happy' French general practitioners' strategies

Elisabeth RICHOU, Juliette WINS

Ucbl, Lyon(lyon 03eme), France

Context: There are growing concerns in France about burnout and loss of purpose among general practitioners (GPs). Most of the recent studies focus mainly on practitioners' distress and difficulties, while few studies analyze professional satisfaction and the strategies that promote it. This situation has a negative impact on young GPs and residents regarding their future career.

Objectives: The main objective was to explore the strategies supporting professional fulfillment and happiness among French GPs.

Methods: We conducted a qualitative study based on semi-structured interviews with twenty French general practitioners, following a grounded theory method. Participants were recruited through professional and personal networks using the "snowball" method to maximize diversity. All transcripts were anonymized. Data analyses included coding, categorization, and concept development, and were independently conducted by two investigators before being compared. Interviews were conducted until we reached data saturation.

Results: The study allowed us to highlight many barriers and levers for satisfaction that are common for GPs. More importantly, it showed us the importance of adaptive strategies and their different forms. It turned out that, when faced with the same challenges, all professionals do not adapt the same way, which results in a wide diversity of practices, and ways to be happy. What matters is the

ability to know oneself and one's values, adapt, test new practices, and detach from work whe needed.

Discussion: This study has certain limitations. The small sample size (twenty physicians, all from France) restricts the generalizability of the findings to the broader population of practitioners, and the interviews conducted at a single point in time do not allow for anticipation of how perceptions and strategies may evolve over time. Moreover, the investigators' first experience conducting research and the recruitment through personal networks may have influenced the diversity of the responses collected. It could be interesting to broaden the study to other contexts of place and time.

Conclusion: Professional fulfilment appears as a dynamic balance between autonomy and constraints, engagement and detachment. Self-examining, individual adaptation and continuous adjustment are central. Insights may guide policy, inform training, and help address the evolving challenges in French primary care.

ID 564- A longitudinal examination of General Practitioner wellness in Canada from the National Physician Health Survey

Taylor MCFADDEN, Christopher SIMON, Caroline GÉRIN-LAJOIE

Canadian Medical Association, Ottawa, Canada

Context: Being a general practitioner (GP) can be a deeply rewarding, but workplace challenges can put GPs at a higher risk of negative wellness outcomes. To understand and to improve physician wellness, a National Physician Health Survey (NPHS) is distributed in Canada every 4 years. The 2017 NPHS was the first in Canada to establish national baseline data (N = 2,947 physicians). The 2021 NPHS (N = 4,121), conducted during the COVID-19 pandemic, repeated some of the same concepts to make comparisons overtime. The 2025 NPHS (N = 3,310) provides information on the current state of physician wellness, five years after the pandemic began.

Objectives: Using national data from the 2025 NPHS, this presentation will provide an overview of GP wellness in Canada, with comparisons overtime (2017/2021/2025) and between areas of practice.

Methods: The study design is a longitudinal survey. An Expert Working Group (EWG), with representation from several medical organizations, led survey development. Ethics approval was obtained, and the survey was distributed using multiple strategies (e.g., emails, social media, paid advertisements).

Results: A total of 3,310 Canadian physicians and medical learners responded to the survey, including 1,347 GPs. Results revealed that 48% of GPs are burned out (57% in 2021, 32% in 2017), 41% screened positive for depression (50% in 2021, 35% in 2017), and 10% had recent thoughts of suicide (15% in 2021, 9% in 2017). There were no significant differences in these outcomes when compared with surgical and medical specialists using chi-square tests. However, differences in workplace factors were found. For example, GPs spend significantly more time on administrative tasks (11 hours/week) and are more likely to say the time they spend on the EMR outside of work hours is moderately high/excessive (73%), compared to other areas of practice. Conversely, GPs report higher rates of collegiality (73%) and fewer instances of bullying (10%).

Discussion: While there have been some improvements in GP wellness since 2021, results highlight several strategic areas of focus that should be targeted to further improve outcomes.

Conclusion: Physician wellness impacts patient care and the performance of the overall health system, making supporting GP wellness an imperative.

Corresponding author: Taylor Mcfadden, taylor.mcfadden@cma.ca

ID 223- Elements affecting well-being during medical studies, according to a biopsychosocial approach: an overview of systematic reviews.

Angélique CAMPION [(1)] , Jacques-Yves CAMPION [(2)], Isabelle ETTORI [(1)]

(1) General Practice, Tours, France
(2) Psychiatry, Tours, France

Context: Medical trainees' well-being represents a

major global concern, with observed deterioration in their health, academic performance, and medical practice. Despite the proliferation of studies on risk factors, preventive interventions, and resilience enhancement, their synthesis remains complex despite existing systematic reviews.

Objectives: This overview aims to comprehensively identify determinants of medical trainees' well-being according to the WHO definition and to categorize them through a biopsychosocial approach.

Methods: A systematic search was conducted across six databases (PubMed, Cochrane, PsycINFO, ERIC, ResearchGate, and Exercer) to identify systematic reviews and meta-analyses published between January 2014 and December 2024. The quality of the methodology is assessed using the AMSTAR-2 and JBI tools, and the quality of the results is classified using the GRADE tool by several authors. The graph representation is used to merged all results. This work was not financially supported. Registration number in Prospero is CRD42025634965.

Results: In total, 96 systematic reviews and/or meta-analyses were included, synthesizing 3,535 original studies representing more than 2.6 million medical trainees worldwide. We identified psychological distress as the central issue. The main risk factors were female gender, financial concerns, and addictive behaviors. On the opposite, structured mentoring programs, optimal management of working time, pre-existing psychological resilience, and psychotherapy constitute significant protective factors.

Discussion: Based on an evidence graph, we achieved a clinical synthesis identifying vulnerability factors, modifiable action levers, and effective prevention tools. The cross-sectional nature of the model does not allow establishment of definitive causal relationships but a longitudinal approach would be necessary in the future to determine correlates of well-being impairment.

Conclusion: These findings suggest the necessity for systemic reforms in medical education, particularly through widespread implementation of support programs tailored to students' specific needs and an evolution is required to redefine medical professionalism by integrating self-health preservation as a fundamental ethical dimension. Authors declared no conflict of interest.

Corresponding author: Angélique Campion, amiot.angelique@orange.fr

ID 95- Work-life balance education for family physicians

Snežana KNEŽEVIĆ [1] , Tamara GAJIĆ [2]

(1) Academy Of Applied Studies Polytechnic, Belgrade, Serbie
(2) Geographical Institute "jovan Cvijić" Sasa, Belgrade, Serbie

Context: Work-life balance represents a state where individuals successfully manage work and non-work domains with minimal role conflict, achieving satisfaction in both areas while aligning with personal values and priorities. For family physicians, this involves harmonizing demanding professional responsibilities with personal life, family commitments, and leisure activities. The physician workforce faces increasing burnout rates, with work-life imbalance identified as a significant contributing factor affecting retention, job satisfaction, and quality of patient care. Educational interventions addressing work-life balance represent a potentially modifiable factor in supporting physician well-being and professional sustainability.

Objectives: This study aimed to conduct a comprehensive literature review examining the importance of work-life balance education in family medicine training and identifying evidence-based strategies for achieving sustainable work-life integration.

Methods: A literature review examined English-language publications from 2014 to 2024 in MEDLINE, Embase, and APA PsycINFO databases using search terms "work-life balance" and "family physicians". From 142 initially retrieved studies, 73 were analyzed after screening for relevance to family medicine education and training.

Results: Family physicians face distinctive challenges including extended working hours, continuous patient relationships creating emotional investment, responsibility for comprehensive care across multiple conditions, role overload, administrative burden, and professional isolation particularly in rural settings. Analysis identified key educational domains: boundary management techniques (integration versus segmentation of professional and personal roles), developing

positive attitudes toward work-life balance, enhancing internal locus of control, improving stress recovery mechanisms, and cultivating self-regulation skills. Educational content should systematically address organizational factors (flexible work arrangements, collegial support systems), family dynamics (dual-career challenges, inter-role spillover effects), and individual differences (personality variations, generational preferences regarding work arrangements).

Discussion: Evidence demonstrates that structured work-life balance education improves job satisfaction, life satisfaction, and mental health outcomes among family physicians. Peer support groups and mentorship programs enhance educational effectiveness while promoting cultural transformation within healthcare organizations toward valuing physician well-being.

Conclusion: Integrating comprehensive work-life balance education into family medicine residency programs and continuing professional development is essential for physician sustainability. Educational curricula should incorporate practical skills for managing multiple life domains, supported by organizational culture change promoting work-life integration as a professional competency.

ID 32- Merging Medicine and Motherhood: The Experience of General Practitioners working in the Republic of Ireland

Sinéad LYDON [(1)] , Sanjana BIJU [(1)], Caoimhe MADDEN [(1)], Paul O'CONNOR [(1)], Dara BYRNE [(1)], Niamh HUMPHRIES [(2)], Grant JEFFREY [(3)], Jennifer FINNEGAN [(4)], Keelin O'DONOGHUE [(5)], Sarah FITZGIBBON [(6)]

(1) University Of Galway, Galway, Irlande
(2) Royal College Of Surgeons In Ireland, Dublin, Irlande
(3) Irish Health Service Executive, Dublin, Irlande
(4) Regional Hospital, Mullingar, Westmeath, Irlande
(5) Department Of Obstetrics And Gynecology, Cork University Maternity Hospital, University College Cork, Cork, Irlande
(6) Women In Medicine In Ireland Network, Cork, Irlande

Context: Internationally, more women are becoming doctors than ever. Research, largely from North America, suggests that women doctors are more likely to delay childbearing and require fertility treatments, experience pregnancy complications, and be exposed to hazards that could impact pregnancy. Negative experiences around family planning, pregnancy and motherhood can have negative psychological, financial, or career impacts for woman doctors. Understanding, and improving, experiences of women doctors may be crucial in tackling ongoing GP shortages in Europe.

Objectives: To elucidate the experiences of women GPs' working in XXX (EU member state) around fertility and family planning, pregnancy and motherhood.

Methods: This presentation will describe data from GPs in XXX, collected across two studies. The first study comprised a cross-sectional survey which included items pertaining to fertility, family planning, pregnancy and motherhood along with validated measures of burnout, work-life balance and career satisfaction. The second study involved semi-structured interviews focused on barriers and facilitators to fertility, family planning, pregnancy and motherhood as experienced by women doctors in XXX.

Results: A total of 222 survey responses were received from women GPs. GPs offered valuable insights into their working and family lives. GPs were significantly more likely to report being influenced by pregnancy, childcare, and/or family considerations when choosing their speciality, to have more children, and to have their first child at a younger age than those in hospital-based specialities. GPs also reported higher career satisfaction. In total, 20 GPs have completed interviews. Participating GPs have described a variety of barriers (e.g., reduced income during maternity leave) and facilitators (e.g., supportive colleagues) to balancing work and family.

Discussion: Although General Practice continues to be perceived as "family-friendly", and indeed GPs report having more children and at a younger age, there nonetheless remains significant challenges for women GPs in XXX as they balance work with building and enjoying their family.

Conclusion: As the impact of GP shortages is felt, addressing the challenges experienced by women in the profession is crucial to ensure that General Practice remains an attractive specialty and for health system functioning. Our data will assist

efforts to support and retain women in the profession.

Environment and health

ID 2154- Primary care at the edge: addressing health inequities and zoonotic challenges in a rural frontier

Busra BILIK SEZER [(1)], Metehan GUZELKAYA [(2)]

(1) Tuzluca Family Health Center, Igdir, Türkiye
(2) Department Of Family Medicine, Ankara Training And Research Hospital, Ankara, Türkiye

Context: Moving from urbanised settings to rural frontier border zones exposes stark inequities in access and disease patterns. In geographically isolated areas, primary health care is often delivered with limited referral capacity and long travel times to secondary care.

Methods: This practice-based reflection describes two family physicians' work in a rural border region where the nearest hospital is approximately 45-60 minutes away. To reduce access barriers, a multi-component primary care response was implemented: (1) mobile outreach to remote villages for systematic immunisation and screening; (2) contact tracing and community education for tularemia and scabies, together with periodic maintenance of natural water reservoirs; (3) multidisciplinary brucellosis prevention counselling, including dietitian-led education on safer dairy production; and (4) adapted protocols for populations facing accessibility barriers in local institutional settings. Measurable outcomes were not collected through a formal study design; reflections are grounded in routine service delivery and public health actions.

Originality: The experience illustrates an integrated "One Health" approach in frontier primary care, combining clinical service delivery with environmental and community interventions under severe access constraints.

Lessons learned and future implication: Frontier primary care requires (a) proactive outreach models, (b) culturally sensitive risk communication for blood-borne and zoonotic exposures, and (c) structured communication pathways for populations with diverse ethno-cultural backgrounds. Future wor

Discussion: Zoonoses (brucellosis, tularemia) and scabies dominated clinical priorities and were amplified by untreated water use and livestock-dependent livelihoods. Socio-economic vulnerabilities and religious rituals involving blood-borne risks necessitated a culturally sensitive "One Health" approach. Language barriers among populations with diverse ethno-cultural backgrounds further compromised diagnostic accuracy and treatment adherence.

Conclusion: Border/frontier practice highlights that health equity depends on mobile health capacity and multidisciplinary, context-adapted primary care pathways.

ID 1695- Co-benefits and the first 1,000 days: a document for doctors and patients for sustainable care

Loïc BLANCHET-MAZUEL [(1)] , Etienne MASSIN [(2)]

(1) Groupe De Travail Santé Planétaire, Cmg, Saint-Genis-Les-Ollières, France
(2) Groupe De Travail Santé Planétaire, Cmg, Vienne, France

Context: Planetary health is an evidence-based scientific field that focuses on the links between changes in ecosystems and biodiversity caused by human activities and their impact on the health of living beings and the planet. XXX has set up a working group on planetary health in XXX. Among the topics addressed, one focused on the development of a summary document for patients about the first 1,000 days. This period extends from the beginning of conception, i.e. the meeting of the sperm and the egg, until the child is 2 years old.

Methods: This is a qualitative study carried out by a working group of general practitioners, combining a narrative review of the literature and discussions within the working group. The final document is the result of a consensus reached by the group, based on the most recent scientific evidence.

Originality: The experiment is unique in that it highlights the co-benefits of each piece of advice: financial savings, reduced impact on biodiversity, improved health, among others. The project includes a 20-page guide, a summary document covering the key points, and

Lessons learned and future implication: The perinatal period is a key time for parents who want the best for their child and are motivated to make healthy, sustainable choices that will benefit as many people as possible. It is important to maintain these healthy behaviours. This comprehensive

Discussion: Training on environmental issues remains marginal in medical curricula, despite its significant impact on our current and future practices. This document contributes to continuing education and the general practitioner's understanding of global health through co-benefits.

Conclusion: This guide is fully in line with the preventive role of general practitioners. It provides simple and useful advice tailored to patients to improve their health throughout the perinatal period while preserving global health and biodiversity.

ID 1716- Primary care-based interventions to prevent and mitigate adverse effects of heat in individuals with chronic conditions: a scoping review

Ingmar SCHÄFER, Julia NOTHACKER, Oshika Edris NURY, Martin SCHERER, Dagmar LUEHMANN, Valentina PAUCKE

University Medical Center Hamburg-Eppendorf, Hamburg, Allemagne

Context: As climate change progresses, heatwaves are becoming more frequent worldwide, and increase the risk for morbidity and mortality. Individuals with chronic conditions are particularly vulnerable to adverse effects of heat. Primary care can play an important role in preventing and mitigating these effects.

Objectives: Our study aimed to identify and describe systematically developed, implemented and evaluated interventions in primary care to address adverse effects of heat in individuals with chronic conditions.

Methods: We conducted a scoping review based on a systematic search in Medline, EMBASE, CENTRAL, and LILACS and the trial registers ClinicalTrials.gov, ICTRP, ISRCTN, and OSF. Each record was screened by two researchers. Records assessed as relevant in title-abstract-screening by at least one researcher were included in full-text screening, in which consensus was required. Articles were eligible if they focused on (1) chronic conditions, (2) adverse effects of heat, (3) interventions addressing these effects, and (4) examined effects on health outcomes. Studies (a) with a secondary study design, (b) without adult participants, and (c) without relation to primary care were excluded.

Results: The search identified 10 557 articles and 159 study registrations. The full texts of 44 manuscripts were assessed. Nine manuscripts describing eight completed and one ongoing study were included. Between 2007 and 2023, two studies were conducted in Australia and the USA, respectively, and one each in China, France, Germany, and Russia.

Discussion: We identified some promising approaches. Two interventions aimed to improve heat-related health education. Of two studies aiming to monitor and advise patients during heatwaves, one evaluated patient-related health outcomes. Two studies developed screening tools for vulnerable patients. And two studies focused on rather specific drugs of limited importance for patients with chronic diseases. All evaluation studies reported positive effects. This demonstrates that primary care might be an effective setting for addressing adverse effects of heat.

Conclusion: The current state of evidence is alarming. In the last twenty years, only eight studies on interventions in this context have been completed, of which five evaluated health outcomes, and only two were in an experimental design. Further research is needed to determine which approaches are most promising in this context.

ID 1607- Environmental Exposure Counseling During Pregnancy: Practices and Barriers Among Healthcare Professionals

Matthieu ARIZA [(1)] , Flore MANNIER [(2)], Karen CHARDON [(1)], Elodie HARAUX [(1)]

(1) Péritox Laboratory, Périnatalité & Risques Toxiques, Umr-I 01 Ineris, Picardy Jules Verne University, Curs Avenue René Laennec, Amiens, France
(2) Hospital University Of Amiens Picardy, Amiens, France

Context: Pregnant women and foetuses are particularly vulnerable to environmental pollutants, including industrial chemicals and pesticides, which have been linked to congenital anomalies, endocrine disruption and neurodevelopmental disorders. However environmental health training among primary care providers remains limited, which could affect the quality of information provided during antenatal care.

Objectives: The aim is to assess the information and counselling provided to pregnant women regarding environmental exposures, and to explore the knowledge, attitudes, and perceived barriers of healthcare professionals.

Methods: A cross-sectional survey was conducted in 2024 among general practitioners, gynaecologists and midwives working in northern France. A total of 1,352 questionnaires were distributed (498 to general practitioners, 254 to gynaecologists, and 600 to midwives) by email and post. The questionnaire was developed and validated by a multidisciplinary scientific committee.

Results: A total of 136 professionals responded: 67 general practitioners, 26 gynaecologists and 43 midwives. Most were women (68%) and aged 31–45 years (56%). Overall, 65% of respondents had received no training in environmental health, although 86% expressed a willingness to address environmental risks in consultations while 53% did not know how to integrate such counselling into routine care. Dietary advice was the most frequently provided (57% always, 32% sometimes), whereas discussions on cooking and reheating methods (55% never), cosmetics and hygiene products (59% never), and household products including pesticides or fragranced products (55% never) were largely absent. Discussion on indoor air quality and nursery preparation were inconsistent. The main barriers reported were a lack of time, insufficient knowledge, and limited resources to support patient guidance.

Discussion: Although limited by a low response rate and self-reported data, the findings highlight a clear gap between healthcare professionals' motivation and their ability to translate environmental health knowledge into routine prenatal counselling. Inconsistent practices across professions suggest structural rather than individual barriers, particularly related to training and availability of practical tools.

Conclusion: Despite high perceived relevance healthcare professionals insufficiently inform pregnant women about environmental exposures. Strengthening environmental health training and developing accessible counselling tools could support the integration of preventive messages into routine prenatal care.

ID 1527- Climate change and extreme heat in the XXX: Assessing health impacts and health system preparedness in XXX

Aishana JOSHI

Department Of Wellness, Nepal Mediciti Hospital, Lalitpur, Népal

Context: Urban areas and XXX foothills in XXX are increasingly experiencing health impacts from extreme heat events. Although XXX are typically associated with cooler climates, climate change have contributed to rising temperatures making extreme heat an emerging public health concern.

Objectives: The objective of this study is to explore the intersection of health impacts of extreme heat and preparedness of XXX's healthcare system.

Methods: A mixed-method approach was employed, combining survey and semi-structured interviews with 35 Family Physicians working in urban hospitals. The survey explored their experiences in managing heat-related health conditions during the 2025 summer heatwave,

while the interviews assessed institutional preparedness by reviewing availability of protocols, staff training and response mechanisms for heat related illnesses.

Results: Family Physicians reported an increasing number of cases of heat exhaustion, dehydration, heatstroke and cardiovascular events particularly among the elderly, outdoor workers and individuals with co-morbidities during the 2025 summer heatwave. Despite these growing health risks, healthcare systems remain underprepared. Family physicians reported lack of heat-specific training, limited awareness of heat action plans and inadequate resources for managing heat-related emergencies. Healthcare infrastructures in XXX lack heat resilient design and effective cooling systems, limiting their ability to safeguard patients and staff during extreme heat events.

Discussion: Extreme heat is becoming an increasingly significant health threat in regions traditionally considered climatically cold. Rise in heat-related illnesses during the 2025 summer heatwave reported by Family Physicians indicate that vulnerable populations such as the elderly, outdoor workers and people with chronic conditions are experiencing substantial health burdens. The reported lack of heat-specific clinical training, limited awareness on heat action plans and inadequate cooling facilities highlight critical gaps in health-system preparedness. Strengthening clinician capacity, implementing structured heat-health protocols and improving infrastructure resilience are critical in ensuring effective health systems response to future heatwaves.

Conclusion: This study highlights the urgent need to integrate heat-health risk assessment into urban health planning in the XXX. Capacity building of clinicians through climate change focused training, heat-health awareness campaigns and comprehensive heat action plans within healthcare systems are critical steps in mitigating the health impacts of extreme heat in XXX health systems.

Corresponding author: Aishana Joshi, joshiaishana@gmail.com

ID 1176- Association between protective behaviour and adverse effect of heat in primary care patients with chronic diseases from Italy and Germany

Ingmar SCHÄFER, Julia NOTHACKER, Martin SCHERER, Dagmar LÜHMANN, Valentina PAUCKE

University Medical Center Hamburg-Eppendorf, Hamburg, Allemagne

Context: Due to climate change, mitigating adverse effects of heat has become an important aim of healthcare professionals. However, little is known about the effectiveness of protective behaviour.

Objectives: Our study analysed how primary care patients with chronic diseases from Germany and Northern Italy protected themselves from adverse effects of heat and how effective their respective behaviour was.

Methods: Prospective cohort study based on an online survey and gridded hourly temperature data from ERA5-Land. Sociodemographic data and participants' intentions to protect themselves were reported at baseline. Health complaints were measured by limitations in usual activities due to 14 specific symptoms on the warmest days of each week. At the same time, the actual protective behaviour was reported. Data were analysed by mixed-effects multivariable linear regression analyses.

Results: Our data set included 1,276 observations of 176 individuals. Response rate was 31.2%. Participants' mean age was 59.9 years (standard deviation, SD: 14.2), 94 participants (53.4%) were female and 52 (29.6%) lived in Italy. Participants from Germany reported a stronger intention to protect themselves (22.8, SD: 4.1 vs. 21.0, SD: 5.1 in Italy, p=0.019), but there were no differences in the summary score of the actual behaviour during warmer days (11.1, SD: 4.0 vs. 11.2, SD: 4.2, p=0.556). There were no differences in adverse effects of heat between Germany and Italy (0.88, 95% confidence interval, CI: -2.14/0.37, p=0.166). The intention to protect themselves was not associated with symptom burden (0.04, 95% CI: -0.09/0.16, p=0.555), but there was an association with the actual behaviour. Specifically, sufficient fluid intake was associated with less adverse effects of heat (-0.50, 95% CI: -0.80/-0.21, p=0.001), and avoiding sun and heat (0.26, 95% CI: 0.08/0.44, p=0.005 to 0.29, 95% CI: 0.05/0.53, p=0.020), cooling down (0.49, 95% CI: 0.15/0.84, p=0.005), and avoiding physical activity (0.48, 95% CI: 0.27/0.68, p<0.001) were associated with more adverse effects.

Discussion: Except for fluid intake, benefits of protective behaviour could not be demonstrated. One reason could be a close interrelation between increasing symptom burden and behavioural adaptations.

Conclusion: Still, more data on the effectiveness of protective behaviour are needed. Future studies should evaluate these effects in an experimental design.

Corresponding author: Ingmar Schäfer, in.schaefer@uke.de

ID 442- Frontline Communicators: The GP's Role in Local Environmental Health Crises

Pieter JANSEN [(1)] , Sofie APERS [(1)], Eva BONGAERTS [(2)], Kathleen BEULLENS [(1)], Gijs VAN POTTELBERGH [(1)]

(1) Ku Leuven, Leuven, Belgique
(2) Vito, Mol, Belgique

Context: Local environmental pollution from industrial activities and hazardous substances represents a significant but often underestimated public health threat. These exposures can generate acute concern within affected communities, particularly when health effects are uncertain, delayed, or difficult to attribute to a single pollutant. Media coverage may amplify fear and stress, underscoring the need for clear and transparent risk communication.

Objectives: This systematic review evaluates strategies for communicating health risks of local pollution, focusing on their impact on public knowledge, stress, and fear.

Methods: We performed a mixed-methods systematic review across PubMed, Embase, Cochrane, Scopus, and PsycArticles, supplemented by reference and citation tracking. Eligible studies included quantitative and qualitative designs examining populations exposed to localized chemical or air pollutants. Outcomes assessed were changes in knowledge, behavior, stress, or fear following communication strategies. Quality appraisal was conducted using the Mixed Methods Appraisal Tool. Quantitative data were synthesized through random-effects meta-analysis where feasible, and qualitative findings were analyzed using thematic synthesis, with confidence in results evaluated using GRADE and CERQual.

Results: 69 Articles were used in this systematic review. 39 Contained only quantitative data, 20 only qualitative data and 10 were mixed method studies. Effective strategies empowered communities with concrete actions to reduce exposure, involved residents in communication processes, acknowledged stress, and addressed scientific uncertainty using accessible language without minimizing concerns. Training healthcare professionals, particularly general practitioners, supported integration of risk communication into community health. Distrust toward industry and government was common but might be mitigated through openness and involvement of trusted local figures.

Discussion: Local pollution poses substantial risks to public health and often generates distress within affected communities. Well-designed communication can transform this distress into empowerment, enabling residents to engage in exposure avoidance, remediation, and dissemination of accurate information. Involving healthcare providers strengthens community trust, while evidence from this review can guide policymakers in developing practical communication guidelines for local pollution events, fostering resilience and confidence at the community level.

Conclusion: When confronted with local pollution, the public often turns to general practitioners for guidance on health effects. Without clear communication guidelines, practitioners may be ill-equipped to respond. Evidence-based guidance can better support them in informing patients.

ID 2192- Care pathways and priority needs of asylum seekers unaccommodated in Brussels: an ethnographic health study

Marie PISSOORT [(1)] , Céline MAHIEU [(1)], Charlotte MARTIN [(2)]

(1) Unité De Recherche En Soins Primaires (ursp), Université Libre De Bruxelles (ulb), Bruxelles, Belgique
(2) Université Libre De Bruxelles (ulb), Service De Maladies Infectieuses Chu Saint-Pierre (bruxelles, Belgique), Bruxelles, Belgique

Context: Since 2022, Belgium has faced a worsening reception crisis for asylum seekers. In January 2025, access to governmental accommodation required an average wait of about four months. Single men were especially affected, with frequent disruptions in access to medical assistance.

Objectives: A three-phase study aimed to synthesise available health data on unaccommodated asylum seekers. This abstract reports findings from Phase 1, which gathered the perspectives of those concerned, exploring lived experiences and perceived health needs.

Methods: We used an ethnographic design with four weeks of field observation and 20 on-site interviews across reception and care settings. Participants were selected to reflect diverse ages and nationalities. Field notes and interviews were analysed using thematic content analysis.

Results: Findings showed fragmented care pathways shaped by street survival strategies. Access to care was hindered by multiple barriers, notably limited and unclear information provided to this population. Reported health problems were closely linked to the precariousness of street conditions, including psychological distress, hygiene challenges, chronic pain, fatigue, and poor diet. Priority needs centred on housing and safety, viewed as prerequisites for health.

Discussion: The ethnographic approach enabled the direct involvement of those affected, who are experiencing an unprecedented situation in the current context. Barriers to health are closely linked to the conditions of non-reception and to the fragmentation of initiatives implemented in an emergency, without the possibility of a long-term vision or continuity of care.

Conclusion: The care pathways and health problems of unaccommodated asylum seekers are specific to this population. Harmonisation and continuity of care across the various structures involved, along with consideration of their particular needs, are necessary to improve access to care for these individuals.

ID 2214- Rethinking moral injury in the mental health of traumatised refugees: insights from Iranian torture survivors in the UK

Roghieh DEHGHAN

University College London, London, Royaume-Uni

Context: Refugees with experiences of trauma commonly present to primary care with complex mental health needs. The concept of moral injury has increasingly been applied to refugee populations to explain forms of distress that may not fit diagnostic criteria for post-traumatic stress disorder. However, moral injury originated within Western military psychiatry and may not adequately capture the cultural and ethical frameworks through which refugees understand their experiences.

Objectives: To explore how Iranian refugee torture survivors living in the UK conceptualise moral and ethical distress in relation to trauma and mental health, and to assess the relevance and limitations of the concept of moral injury in this population.

Methods: This qualitative study involved in-depth semi-structured interviews with 11 Iranian refugee torture survivors and three focus groups with 13 mental health professionals working with refugee populations. Data explored experiences of imprisonment, torture, resettlement, and associated moral and ethical meanings. Analysis was conducted using a hermeneutic phenomenological approach combined with thematic analysis.

Results: Participants rarely described their distress as an “injury” to moral beliefs. Instead, narratives centred on Ensāniat, a culturally embedded ethical concept encompassing human dignity, moral agency, and relational humanity. Ensāniat enabled participants to articulate experiences of suffering, endurance, and ethical disruption without

positioning themselves as moral transgressors. Applying standard moral injury frameworks risked conflating the standpoint of perpetrators with that of victims and obscuring survivors' lived moral realities.

Discussion: These findings highlight limitations in the uncritical application of moral injury to refugee mental health. The dominance of Western psychiatric constructs may contribute to epistemic injustice and constrain culturally responsive care in both primary care and specialist mental health settings.

Conclusion: Recognising culturally grounded ethical frameworks such as Ensāniat may help GPs better understand and respond to the mental health needs of traumatised refugees. Culturally attuned concepts can support more equitable, humanistic, and trauma-informed primary healthcare. Suggested MeSH Keywords: Refugees, Trauma, Mental Health, Moral Injury, Cultural Competency

ID 1200- HealthEmove: co-creation in digital health solutions like an Electronic Personal Health Record for vulnerable populations

Steven VAN DE VIJVER

Olvg, Amsterdam, Pays-Bas

Context: Although everyone has the right to basic healthcare, access remains difficult for mobile populations living in vulnerable circumstances, such as undocumented migrants (UDMs), asylum seekers, and EU-labour migrants. Because they frequently move between locations and healthcare providers (HCPs), medical information is often lost, reducing continuity of care and increasing costs through duplicated procedures. To address this, we developed a phone-based Electronic Personal Health Record (EPHR) called HealthEmove, designed together with mobile populations and the HCPs who work with them.

Methods: A prototype was developed and iteratively evaluated by (un)documented migrants, HCPs and volunteers experienced with mobile populations. Their feedback informed iterative revisions until the first version was released. This version was tested by 15 (un)documented participants using a mixed- method qualitative design. Participants completed a baseline interview with usability testing and a follow-up interview after four to eight weeks. Guided by the Technology Acceptance Model (TAM) and content validity testing, we assessed ease-of-use, comprehensibility, perceived usefulness, attitude towards using, behavioural intention to use, and actual system use

Originality: Although other EPHRs exist, few explore user-experiences of mobile populations or let their feedback inform the design. Given the diversity within these groups and the contexts in which they live, their involvement is essential for developing user

Lessons learned and future implication: Engaging end-users and HCPs throughout the design process improved ease-of-use and relevance while considering diverse levels of (digital) literacy, cultural differences, and barriers to accessing healthcare. This input led to features such as

Discussion: With this case study of HealthEmove we would like to discuss the barriers and facilitators in this process by interacting with the group

Conclusion: As global mobility rises, the importance of technically functional and culturally responsive EPHRs grows. The case of HealthEmove shows that co-creation with stakeholders supports the development of equitable, user-friendly digital health tools that improve continuity and quality of care.

ID 706- Using an open-source language model to overcome communication barriers and support mental-health care for foreign caregivers during wartime

Yuval SHACHAF, Amit GIBORI, Hanny YESHUA

The Department Of Family Medicine, Tel-Aviv District, Clalit Health Services, Israel, Tel Aviv, Israël

Context: Foreign caregivers experience significant

psychological burden, intensified during armed conflict, reducing their capacity to cope with daily demands and stressors. Clinical assessment is frequently limited by linguistic and cultural gaps. In many Asian caregiving communities, distress may be described through physical or functional complaints rather than explicit emotional terms, reducing the effectiveness of standard screening questions. Open-source large language models (LLMs) may help bridge these communication gaps by providing culturally attuned explanations.

Methods: A 46-year-old female caregiver from the Philippines presented with insomnia, tearfulness, irritability, and stress-related overeating during a period of regional instability. Initial assessment was limited by language and cultural framing. To overcome this barrier, an open-source LLM was used as a real-time multilingual communication mediator. The LLM reshaped explanations and questions into accessible, culturally familiar language that matched the patient's way of describing her difficulties. This enabled her to discuss effects of missile alerts, family separation, and workplace pressures with greater clarity. Using this mediated dialogue, PHQ-9 and GAD-7 (validated screening tools for depression and anxiety) were administered in a culturally sensitive manner, aligning functional and physical descriptions with the emotional and cognitive domains required for standardized scoring. These insights enabled the family physician to develop a care plan including weekly supportive encounters, sleep-hygiene strategies, and low-dose SSRI. In the following weeks, the patient reported better sleep and improved coping with daily stressors.

Originality: This case illustrates a practical and scalable approach for integrating open-source LLMs into routine primary care encounters where conventional interviewing is limited by linguistic or culturally patterned communication barriers. It highlights how access

Lessons learned and future implication: Culturally adapted LLM-supported communication may enhance early detection of depression and anxiety among foreign caregivers, particularly in crisis settings. Future practice may integrate similar tools to help reduce inequities in mental health access a

Discussion: The LLM improved interpretability of somatic complaints and supported more accurate clinical assessment, while all diagnostic reasoning and treatment decisions remained physician-led.

Conclusion: LLM-assisted, culturally adapted communication can strengthen mental-health care for foreign caregivers by improving access, diagnostic clarity, and patient participation in primary care.

ID 229- PREVISEDA: Early screening and primary-care management of sexual violence among recently arrived asylum seeking women – preliminary observational findings from a multiprofessional protocol

Jérémy KHOUANI

Department Of General Practice, Marseille, France

Context: Recently arrived asylum-seeking women face a markedly increased risk of sexual violence (SV) during the first months in host countries, while simultaneously encountering major barriers to accessing healthcare. PREVISEDA is a national programme aiming to implement an early, coordinated, primary-care–based intervention for the prevention, detection, and management of SV among asylum-seeking women in France. We report preliminary observational results from the first implementation site.

Objectives: To evaluate the impact of a primary-care protocol for systematic SV screening and multidisciplinary management among recently arrived asylum seeking women

Methods: Retrospective observational study of all adult migrant women included in the PREVISEDA protocol at a participatory primary-care centre (May 2022–December 2023). SV history was classified as previously known or newly disclosed through screening. We analysed follow-up intensity,

referrals, mental-health indicators, and psychotropic prescriptions. Visits were weighted per month of follow-up.

Results: Among 121 women (mean age 33 years; 48.8% from West Africa), 53.7% had experienced SV. Only 19.8% had a known history; screening newly identified SV in 42.3% of the 97 women without prior documentation, frequently during the first consultation (62.3%). Survivors required significantly more follow-up (2.6 vs 1.7 visits/month, p=0.02) and more mental-health-related consultations and psychotropic prescriptions. Multidisciplinary referrals were frequent (64.5%), but psychological care remained difficult to access despite referrals.

Discussion: These preliminary data demonstrate that proactive SV screening integrated into primary care substantially increases identification of previously unrecognised trauma and improves care engagement. The intensity and nature of follow-up highlight unmet medical, psychological, and social needs in this population. These findings informed the design of PREVISEDA, a national, Ministry-of-Health–funded programme that now aims to prospectively and comparatively evaluate this model across 6 French regions. In parallel, preparatory work is underway to examine the feasibility of a European extension in collaboration with academic and community partners.

Conclusion: This pilot work shows the feasibility and clinical relevance of an early, structured primary-care model for SV screening and management among migrant women. It provided the empirical basis for the multicentre PREVISEDA trial and contributes to shaping future national and European strategies to promote safety, equity, and mental-health support for recently arrived women.

Corresponding author: Jérémy Khouani, jeremy.khouani@univ-amu.fr

ID 227- Prevention and management of sexual violence among refugee, asylum-seeking, and migrant women in high-income countries: a systematic scoping review

Jérémy KHOUANI [(1)] , Raquel GOMEZ BRAVO [(2)]

(1) Department Of General Practice, Aix-Marseille Univ, Department Of General Practice, Aix-Marseille Univ, Marseille, France, Marseille, France
(2) Research Group Self-Regulation And Health, Institute For Health And Behaviour, Department Of Behavioural And Cognitive Sciences, Faculty Of Humanities, Education, And Social Sciences, Luxembourg, France

Context: Refugee, asylum-seeking, and migrant women face high lifetime exposure to sexual violence (SV) before, during, and after migration. This prolonged exposure is associated with major mental health consequences, yet host-country interventions remain fragmented. No recent review has synthesised prevention and response strategies implemented specifically in high-income countries (HICs).

Objectives: To systematically map and analyse programmes in HICs aiming to (1) prevent sexual violence and/or (2) address its mental-health consequences among refugee, asylum-seeking, and migrant women.

Methods: Following PRISMA guidelines (PROSPERO CRD420250652608), a scoping review was conducted in PubMed (1990–April 2025). Eligible studies included primary quantitative, qualitative, or mixed-methods research evaluating interventions targeting SV prevention or mental-health response in HICs. Two reviewers independently screened, extracted data, and appraised methodological quality using RoB2, ROBINS-I, and MMAT. Due to heterogeneity of interventions and outcomes, a narrative synthesis was performed.

Results: Nine studies met inclusion criteria (3 quantitative, 3 mixed-methods, 3 descriptive), conducted across Europe, North America, and Australia. Prevention interventions emphasised early, rights-based information on arrival; gender-segregated or safer accommodation; empowerment and education programmes; and initiatives fostering social support. Response interventions highlighted trauma-informed mental-health care—individual or group counselling, culturally adapted therapeutic approaches, and integrated services for survivors of female genital mutilation. Across studies, the effectiveness of interventions relied on interprofessional coordination, interpretation services, and culturally sensitive communication.

Evidence quality was limited by small samples, lack of comparative trials, and scarce long-term mental-health outcomes.

Discussion: Findings suggest that early, coordinated, and intercultural interventions are essential to both prevent SV and mitigate trauma-related disorders. Primary care settings, especially when combined with mobile or outreach models, may be key entry points for early detection and psychosocial support. However, robust comparative evidence remains lacking, particularly regarding mental-health impact and equity-driven outcomes.

Conclusion: In HICs, interventions to prevent and manage sexual violence among refugee, asylum-seeking, and migrant women should include early rights-based information, safe housing, trauma-informed mental-health care, and strong interprofessional coordination. Rigorous comparative studies are urgently needed to evaluate effectiveness and guide policies promoting mental-health equity for displaced women.

Corresponding author: Jérémy Khouani, jeremy.khouani@univ-amu.fr

ID 23- Living in Limbo: Providing Primary Care for Asylum Seekers in Direct Provision

Louise FITZGERALD

Grafton Medical, Dublin, Irlande

Context: Migration is a defining feature of modern society, with displacement often accompanied by profound medical and psychological needs. In Ireland, asylum seekers are housed in “direct provision” centres, frequently facing barriers to healthcare. By the end of 2018, over 6,000 people seeking international protection were accommodated in such centres.

Methods: During my placement as a GP registrar, a direct provision centre opened locally, housing approximately 90 asylum seekers. Initial healthcare planning was absent. My first encounters with patients in an out of hours setting highlighted critical gaps: a pregnant woman with suspected ectopic pregnancy, a man left without antihypertensives for weeks, and a young woman with diabetes and neurological symptoms but no GP care. In response, our practice invited 30 patients, including 10 children, into care, offering extended initial assessments. Challenges included absence of medical cards, language and cultural barriers, disrupted continuity due to relocations, and lack of transport or childcare. Clinical issues ranged from vitamin D deficiency and chronic disease management to maternity care and complex psychological trauma. Strengths of our approach included rapid team response and provision of holistic GP-led care; limitations lay in overstretched resources and reliance on voluntary goodwill.

Originality: While international literature highlights migrant health inequalities, this case demonstrates how a community practice can respond proactively to system gaps in Ireland. Unlike structured resettlement programs, direct provision creates instability. Our ap

Lessons learned and future implication: The experience underlined how systemic barriers—lack of GP registration, poor screening processes, limited psychological supports—compound vulnerability. Inclusion within general practice not only improved health outcomes but fostered community integratio

Discussion: This case reflects the conference themes: Liberty—the freedom to provide equitable care despite system constraints; Equality—addressing barriers to access; and Fraternity—building solidarity between practitioners, patients, and communities.

Conclusion: The experience highlights how general practice can embody humanism, offering “Céad Míle Fáilte”—a hundred thousand welcomes—through healthcare.

Find a doctor

ID 2065- A Meta-analysis of the Prevalence and Influencing Factors of Family Doctor Contract Service in China

Ma LI, Shan ZHOU, Taihong LV

Department Of General Medicine, Beijing Tiantan Hospital, Capital Medical University, Beijing, Chine

Context: Family doctor contract services are essential for universal health coverage and are widely implemented internationally, playing a key role in China's primary healthcare system. With rising chronic disease burdens and stronger policy support, systematically assessing enrollment and its determinants is vital to improving service quality and effectiveness.

Objectives: This study aims to evaluate the national family doctor contract rate and identify its main influencing factors, providing a scientific basis for optimizing contract services.

Methods: We systematically searched cross-sectional studies on family doctor contract rates in China published between January 2018 and December 2023 in both Chinese and English databases. Two researchers independently conducted literature screening, data extraction, and quality assessment using the JBI tool. Stata 17.0 was used to perform meta-analysis, employing a random-effects model to pool contract rates and integrate effect sizes for influencing factors.

Results: A total of 18 studies were included. The pooled national family doctor contract rate was 54.37% (95% CI: 41.81%–66.66%), with a significant urban-rural disparity: urban areas had a higher contract rate (63.6%) than rural areas (40.8%). Key factors influencing enrollment included older age (OR = 1.029, 95% CI: 1.012–1.047), unemployment (OR = 1.517, 95% CI: 1.046–2.223), presence of chronic disease (OR = 1.709, 95% CI: 1.636–1.786), poorer economic status (OR = 3.177, 95% CI: 2.552–3.955), possession of medical insurance (OR = 1.994, 95% CI: 1.687–2.354), and awareness of contract services (OR = 8.174, 95% CI: 7.106–9.412).

Discussion: Contract uptake remains moderate and well below the 2035 target, with pronounced urban–rural inequity suggesting uneven service capacity and access. Cross-sectional heterogeneity limits causal interpretation. Policies should strengthen rural staffing and resources, raise public awareness and trust, and embed chronic-disease prevention and follow-up. Longitudinal, implementation-focused evaluations are needed.

Conclusion: While notable progress has been made in family doctor contract services in China, a gap remains toward the 2035 target of 75% coverage, particularly in rural areas. The ongoing "Strengthening Primary Care" strategy, through optimized resource allocation, enhanced workforce incentives, and service model innovation, holds promise for improving the accessibility and sustainability of contract services, thereby supporting the gradual achievement of high-quality universal coverage.

ID 2004- Availability of Family Physicians in Kyrgyzstan

Erkinai BOTBAEVA

I.k. Akhunbaev Kyrgyz State Medical Academy, Bishkek, Kirghizistan

Context: The main principle in the development of the healthcare system is ensuring access to medical services for the population, particularly at the level of primary health care (PHC). One of the key factors contributing to the achievement of this criterion is the availability of an adequate number of healthcare professionals to serve the population.The main principle in the development of the healthcare system is ensuring access to medical services for the population, particularly at the level of primary health care (PHC). One of the key factors contributing to the achievement of this criterion is the availability of an adequate number of healthcare professionals to serve the population.

Objectives: The objective of this study is to examine the trends in the availability of family physicians in the Kyrgyz Republic over the period from 1996 to 2024.

Methods: A retrospective analysis of primary data was conducted, including official reports on human resources from the Center for eHealth of the Ministry of Health of the Kyrgyz Republic for the period 2000–2024; collections of regulatory and methodological documents related to the activities of family physician groups and Family Medicine Centers; and data from the literature published in publicly available sources. Data were statistically processed using Microsoft Excel.

Results: The availability of family physicians has increased since 2000, reaching 1,867 in 2024; however, a substantial shortage remains, with a deficit of 2,416, highlighting the need for effective workforce planning and retention measures, particularly in remote areas.

Discussion: Although the number of family physicians in the Kyrgyz Republic has increased since 2000, the workforce remains inadequate to meet the needs of the population, highlighting ongoing challenges in planning primary health care personnel. The shortage is influenced by population growth, uneven geographic distribution, migration, and limited retention, especially in rural and remote regions.

Conclusion: Despite substantial growth in the number of family physicians over the past two decades, a significant workforce shortage persists in the Kyrgyz Republic. The 2024 deficit highlights the need for sustainable workforce planning and effective retention strategies, particularly in remote and underserved areas, to ensure access to high-quality primary health care.

ID 1896- Work-leave Rotation for General Practitioners in Norway. A Follow-up Study.

Erik PRESTGAARD, Aina JANSEN, Ingeborg ESKERUD, Anette FOSSE, Martin HARBITZ

University Of Tromsø, Tromsø, Norvège

Context: An increasing number of municipalities in Norway have introduced work-leave rotation (sometimes called "fly in, fly out" rotation) for general practitioners, whereby the doctors alternate between fixed periods of work and leave. A study published in 2024 (1) found that these communties were overwhelmingly rural and that they chose to introduce rotating positions du to chronic recruitment difficulties (resulting in a high turnover of physicians) or high out-of-hours work burden for local general practitioners (GPs). It also showed that this type of novel work arrangement was successful in recruiting GPs to these municipalities. However, as many of the GPs had been recently hired, the study could not determine if work-leave rotation was successful in retaining doctors. Nor were patients´ experiences with rotating doctors examined. We have not found previous studies (apart from the reference included) on this topic.

Objectives: The objectives of the current sudy is two-fold. Firstly, it aims to follow up the results of the original publication from 2024 (1) by investigating if those original municipalities were in fact able to retain GPs and if this affects turnover rates. Secondly, it will investigate how patients experience having a rotating doctor as their GP.

Methods: We will conduct an exploratory multiple-case study using quantitative as well as qualitative data from different municipalities that have introduced work-leave rotation for GPs. The case-study methodology is flexible and permits a practice-oriented and holistic approach that includes multiple perspectives, with a variety of data sources that help provide insight. Starting January 2026 we will undertake interviews with physicians and patients as well as sourcing government health data. The study has received fundring from The Norwegian centre for Rural Medicine.

Results: Data collection starts January 2026. Preliminary results will be presented at the conference.

Discussion: NA at this point.

Conclusion: NA at this point. References 1. Prestgaard EE, Fosse A, Abelsen B, Harbitz MB. Work-leave rotation among general practitioners in Norwegian municipalities. Tidsskr Nor Laegeforen. 2024 Nov 19;144(14). English, Norwegian. doi: 10.4045/tidsskr.24.0089. PMID: 39605150.

ID 1641- Addressing the Rural Family Doctor Shortage in Tajikistan: A Mixed-Methods Study to Develop Policy Options for Attraction and Retention

Farrukh EGAMOV, Sheridan MARIAN, Dzamalova MUAZAMMA

Ministry Of Health And Social Protection, Dushanbe, Tadjikistan

Context: Tajikistan faces a critical shortage of family doctors (FDs) in rural areas, impeding universal health coverage. Based on the government's mandate of 1 family doctor per 1200 population, the current ratio at the national level is 1 per 4537 with subregional analysis indicates a more uneven distribution, with ratios ranging from one Family Doctor per 1908 individuals in Dushanbe to one per 8,524 in the mountainous region of GBAO. While the problem is recognized, evidence-based policy solutions tailored to the local context are scarce

Objectives: Objective is to developed policy options for the attraction and retention of family doctors in rural Tajikistan based on stated needs of family doctors.

Methods: An explanatory sequential mixed-methods study was conducted. First, a nationwide online survey of rural FDs (n=227) quantified key dimensions of job satisfaction and intent to leave. Second, in-depth semi-structured interviews (n=25) with FDs, health administrators, and community members were thematically analyzed to explore survey findings.

Results: The survey revealed extremely low job satisfaction, driven primarily by excessively low salaries (reported by 86% of respondents) and a lack of continuing medical education (63%). Qualitative data contextualized these findings, uncovering profound systemic barriers: the low prestige of family medicine within communities; limited pathways for career advancement; and dysfunctional human resource management.

Discussion: A critical finding was the pervasive impact of governance weaknesses in appointment processes and a deeply ingrained "kultura obvineniya" (culture of blame), a Soviet-era relic fostering fear of reprisal and stifling professional autonomy. These factors collectively demoralize the workforce and drive attrition. The crisis in rural Tajikistan extends beyond typical resource contrainsts to include toxic system legacies.

Conclusion: Effective policy must move beyond isolated financial incentives. A multi-pronged strategy is proposed, integrating: 1) A substantial and transparent salary reform tied to rural service, 2) Mandatory, accessible continuous professional development, 3) The creation of clear professional career ladders, and 4) Foundational reforms to human resource management to address governance weaknesses and dismantle the culture of blame, fostering a supportive and accountable professional environment. This study provides a framework for policy development in Tajikistan and similar post-Soviet contexts.

ID 1474- How Forth Valley are using research to reduce health inequalities, increase GP numbers & promote retention

Michael BLACKMORE

Nhs Forth Valley, Stirling, Royaume-Uni

Context: In 2022 NHS Forth Valley GPs had difficulty attracting doctors to work in the more deprived areas The LMC requested a "deep dive" report into the issues affecting recruitment & retention of GPs This highlighted the need for: - earlier engagement of medical students (we have no local medical school) & junior doctors (outreach lectures) - setting up a very successful First5 WhatsApp group/meet & connect "support bubble" - inviting GP trainees along too to encourage networking & social cohesion - sending out an Exit Survey to every Dr who left a post over a 2-year period This work has helped under-doctored deprived areas get more workforce, thus helping to reduce the health inequity of the Inverse Care law

Methods: Research of the literature 28 x informal interviews 35 x Exit Surveys Ongoing work & feedback

Originality: This was a unique request from a desperate LMC, that led to a 47-page report & a job for the author - leading on to National roles

Lessons learned and future implication: Exit Surveys - highlight the "ABC" needs of GP - Autonomy, Belonging & Competence/mastery (also Complexity/variety) First5 Drs have stayed locally more & gone for Partnership sooner Our work is being recognised nationally

Discussion: This was first presented at NHS Education Scotland with very positive feedback - Scottish Government also requested our data Many learning points have been learnt & will be passed on in this report presentation

Conclusion: Making a few simple changes can massively improve recruitment & retention in under-doctored areas

Corresponding author: Michael Blackmore, mikeblackmore@doctors.org.uk

ID 1398- Protocol on Retention and Attraction of Talent in Primary Health Care in Spain

Sara ARES-BLANCO [(1)], Sara CALDERON-LARRANAGA [(2)] , Sofía ANGULO HERNANDO [(3)], Ángel GONZÁLEZ-DE-LA-FUENTE [(4)]

(1) Federica Montseny Health Centre, Gerencia Asistencial Atención Primaria, Servicio Madrileño De Salud.instituto De Investigación Sanitaria Gregorio Marañón. Semfyc, Madrid, Espagne
(2) Wolfson Institute Of Population Health, Queen Mary University Of London, London, Royaume-Uni
(3) Gerencia De Atención Primaria De Burgos, Burgos, Espagne
(4) Organisation For Economic Co-Operation And Development, Paris, France

Context: Spain is developing a new Action Plan for Primary Health Care (PHC) that places strong emphasis on retention of talent, including a specific mandate to incentivise the return of professionals who have left PHC and to address ongoing patterns of attrition and displacement.

Objectives: The overall aim is to analyse the factors driving professional displacement from PHC—both within Spain and internationally—and to generate actionable recommendations to improve retention and facilitate return. The specific objectives are: (1) to identify the main determinants influencing departures from PHC; and (2) to develop tailored recommendations to promote the return and long-term retention of Family Doctors (FDs) and Community Nurses (CNs) at national and regional levels.

Methods: The study focuses on FDs and CNs and adopts a multi-method design grounded in an international conceptual framework on retention and return, adapted to the Spanish context. The framework structure is: (A) employment and remuneration; (B) working conditions and organisation; (C) professional development and career; and (D) meso-level management and autonomy. Four components will be conducted between October 2025 and February 2026: (1) Documentary review (2022–2025): Analysis of Spanish and international literature, including grey literature and policy documents. (2) Quantitative analysis: Descriptive and comparative assessment of the availability, distribution and contracting of FD and CN nurses across regions (2022–2025), using official statistical and administrative sources. (3) Normative and organisational mapping: Examination of regulations, incentives, contracting models and governance arrangements across regions. (4) Qualitative inquiry: Exploration of experiences, challenges and proposed improvements through 20–30 semi-structured interviews and 2–3 focus groups with family doctors, community nurses, professional associations, unions and health system managers. Data will be analysed thematically.

Results: Findings from all components will be integrated by dimension and professional category. Using a problem–measure–responsible–timeframe matrix and a multi-criteria prioritisation approach (impact, feasibility, cost, equity and acceptability).

Discussion: This project generate evidence-informed, context-sensitive recommendations to strengthen retention and foster the return of FDs and CNs, ultimately contributing to the sustainability and quality of PHC

Conclusion: The project will produce a clear synthesis of the determinants of attrition and mobility in PHC

ID 1091- Implementing a nationwide weekly rotation of physicians to restore primary care access in underserved rural areas

Martial JARDEL, Pierre AUBOIS, Cindy BOIZARD, Alain JALLAIS, Paul-Henri LAMBERT, Clémentine LABOURÉ, Elsa LECLERCQ, Perrine MOLINIE

Médecins Solidaires, Le Dorat, France, Le Dorat, France

Context: In France, access to primary care has reached an unprecedented crisis point. Thousands of patients no longer have a primary care physician and therefore lose access to essential healthcare. New organizational models are urgently needed.

Methods: nstead of asking a lot from a few physicians, this initiative sought to ask a little from many. The model consisted of implementing a weekly rotation involving several hundred general practitioners within health centers established in underserved rural areas. Through this continuous relay system, a permanent medical presence was restored in eleven villages previously deprived of care. Rather than relying on a single family doctor, patients now benefit from a "family of doctors." As of 1 November 2025, 900 general practitioners are engaged in the program. Three main profiles have emerged: retired physicians (35%), locum doctors (30%), and established physicians (25%), whether in private practice or employed positions. Retired physicians provide more than 60% of weekly rotations. Since the beginning of the initiative, more than 70,000 medical consultations have been carried out, and over 12,000 patients are followed regularly; the centers can register them as their primary care provider.

Originality: This experience introduces a novel model that distributes the care of a population among several hundred practitioners while maintaining continuity of care, including for chronic conditions. While rotation systems exist in isolated regions of other countr

Lessons learned and future implication: The experience highlights physicians' willingness to contribute to underserved areas, particularly among retired doctors. Short, flexible commitments appear attractive across profiles. Success depends on centralized logistics ensuring reliable coordinatio

Discussion: This initiative shows that large-scale mobilization of physicians can restore access to care. Key challenges include long-term quality, practice variability, and operational sustainability.

Conclusion: This proof of concept demonstrates that innovative organizational approaches can restore continuous primary care in chronically underserved territories.

Focus on the GP

ID 1913- The relationship between family physicians' reading habits and patient-centered orientation

Vildan MEVSIM, Emrullah SAN

Dokuz Eylul University Faculty Of Medicine, Department Of Family Medicine, Izmir, Türkiye

Context: Patient-centered care is a core principle of family medicine and is influenced by physicians' professional, personal, and reflective practices. Reading habits may contribute to empathy, perspective-taking, and communication skills; however, their relationship with patient-centered orientation has been insufficiently explored among family physicians.

Objectives: This study aimed to examine the relationship between family physicians' reading habits and their patient-centered orientation.

Methods: This cross-sectional analytical study was conducted among actively practicing family physicians in Türkiye. A total of 396 physicians participated via an online survey. Data were collected using a sociodemographic questionnaire, a Reading Habits Questionnaire, the Adult Reading Motivation Scale, and the Patient–Physician Orientation Scale (PPOS). Statistical analyses were performed using SPSS 24.0, with a significance level of $p<0.05$.

Results: The mean total PPOS score was 52.83 ± 6.85, indicating a relatively high level of patient-centered orientation. Female physicians had

significantly higher total and care subscale scores, while male physicians scored higher on the sharing subscale. Longer professional experience (≥16 years) was associated with higher sharing and care scores. Time spent on academic reading was not significantly associated with patient-centeredness. However, physicians who allocated ≥9 hours per week to leisure reading had significantly higher care subscale scores (p=0.001). Higher leisure reading time was also associated with greater reading motivation across multiple subscales.

Discussion: These findings suggest that not only professional experience but also the type of reading may influence patient-centered attitudes. Leisure reading, rather than academic reading alone, appears to support the caring dimension of patient-centered care.

Conclusion: Reading habits—particularly leisure reading—are associated with patient-centered orientation among family physicians. Encouraging diverse reading practices may represent an accessible strategy to support patient-centered care in family medicine.

ID 1477- Dealing with mistakes- Core values of colleague-friends

Solfrid SIQVELAND

Main Author, Rosendal, Norvège

Context: I want to use mistakes we make as gp's and the use of formative learning. This will give us the opportunitie to coconstruct together, and learn, continously in our lives. This will prevent doctor burn-put, This is so important that we should make core values of colleague-friends for all GP's.

Methods: Self reported

Originality: Core values and principles of familiy medicine , by Nordic congress of family medicine.

Lessons learned and future implication: 1. We promote continuity of a colleague-friend, where two or more colleagues build mutual trust and enable each other 2. We care about each other. Colleague-friends help each other to understand our own situation better 3. Colleague-friends prioritise

Discussion: I believe there is a continuum from feedback in medical school, as an intern and young doctor, to the lives of senior doctors: we always need opportunities to reconstruct our knowledge and reflect on our experiences, both good and bad. “All sides should have opportunities to reconstruct their knowledge and reframe practice during feedback. A shared understanding or solution needs to be developed that neither party possessed before. This requires a conscious and deliberate effort enacted through dialogue. “ Medical education Volume53, Issue7 July 2019 Pages 652-654 When I say … feedback Rola Ajjawi, Glenn Regehr

Conclusion: I believe there is a continuum from feedback in medical school, as an intern and young doctor, to the lives of senior doctors: we always need opportunities to reconstruct our knowledge and reflect on our experiences, both good and bad.

ID 1275- Caring for oneself and for society: portrait of a socially accountable general practice.

Naji MOKADDEM, Ségolène DE ROUFFIGNAC

Université Catholique De Louvain, Brussels, Belgique

Context: The concept of Social Accountability in Health (SAH), initially defined by the World Health Organization for medical schools as the commitment to orient their activities toward addressing the priority health concerns of the society they serve, has progressively been extended to health professionals and, more specifically, to the medical field. However, the concrete implementation of this responsibility in physicians’ daily practice remains insufficiently documented. General practice, operating at the interface between the population and its health issues, constitutes a particularly relevant field of investigation.

Objectives: To identify the behaviours and practices that reflect general practitioners' engagement in social accountability in health.

Methods: A mixed qualitative study was conducted among general practitioners in French-speaking Belgium, combining semi-structured participant observations and semi-structured interviews, based on a competency framework for the socially responsible physician. The purposive sample targeted practitioners identified as being engaged in SAH. Data were analysed using grounded theory to develop an explanatory model of socially responsible behaviours in general practice.

Results: Seven general practitioners participated. Analysis of 589 observations and excerpts of discourse led to the identification of 170 codes grouped into 17 themes and two central categories: a personal reflexive dimension and a socially responsible professional dimension. Physicians act at several levels (clinical, community, and societal) by mobilising specific behavioural competencies and a global, equity-driven conception of health. Together, these elements lead to a dynamic balance between personal needs and professional responsibilities, serving the priority health needs of society.

Discussion: The findings indicate that social accountability in health relies less on the practice setting than on a reflexive stance and an engaged approach to SAH.

Conclusion: Maintaining a balance between self-respect and professional demands appears to be an essential condition for delivering high-quality, stable, and sustainable socially responsible practice.

Corresponding author: Naji Mokaddem, dr.nmokaddem@gmail.com

ID 830- Between Personal and Professional: A Qualitative Study on the Relationship Between General Practitioners' Personal and Professional Identity

Dina BOUSBAA [(1)] , Angelique TIMMERMAN [(2)], Nynke VAN DIJK [(3)], Marianne MAK-VAN DER VOSSEN [(1)], Otto MAARSINGH [(1)], Anne DE LA CROIX [(1)]

(1) Department Of General Practice, Amsterdam Umc, Amsterdam, Pays-Bas
(2) Department Of Family Medicine , Maastricht University, Maastricht, Pays-Bas
(3) Department Of General Practice, Amsterdam Umc; Faculties Of Exercise & Sports, Nutrition, And Health, Amsterdam University Of Applied Sciences, Amsterdam, Amsterdam, Pays-Bas

Context: General practitioners (GPs) face increasing clinical, social, and organisational demands that reshape how they define their professional identity. Throughout their training and careers, GPs develop a professional identity in constant interaction with their personal self. This development is influenced by (in)formal statements outlining the norms and expectations of becoming a GP. This raises the question: what messages do these texts convey about how trainees should position their personal and professional identities in an increasingly complex healthcare environment?

Objectives: To examine how the relationship between personal and professional identity in GP training is constructed in both written and spoken language. To identify the implications for education and practice concerning the formation of professional identity.

Methods: A critical discourse analysis, which explores how language shapes and is shaped by the world, was conducted within the XXX GP training context. The dataset included formal documents (e.g., professionalism guidelines, competency frameworks, educational plans) and four homogeneous focus groups comprising trainees, GPs, and educators (n=31). Data were coded using Willig's six-stage framework.

Results: Five discourses were identified: 1. System (overarching): presents structural constraints as inevitable, positioning GPs as adaptive rather than transformative actors. 2. Neutrality: positions the GP as emotionally controlled and politically impartial, with personal identity subordinate to professionalism. 3. Authenticity: legitimises personal expression and diversity within accepted professional boundaries. 4. Visibility of responsibility: extends professional accountability, constructing the GP as a moral figure constantly monitored. 5. Self-care: frames personal wellbeing

as essential for professional functioning, often conflicting with systemic pressures.

Discussion: There are several ways to frame the relationship between personal and professional identity, each of these discourses offers both affordances and boundaries. Some of these boundaries challenge each other or restrict the GP's ability to redefine the relationship. In particular, the system discourse limits trainees' freedom to reshape professionalism. One of the key challenges is the tension between neutrality and authenticity, highlighting that identity formation involves negotiating competing expectations.

Conclusion: Supporting GPs in balancing personal and professional identities requires explicit attention to the importance of discourses. Education needs to acknowledge diverse perspectives and the realities of a changing healthcare system.

Corresponding author: Dina Bousbaa, d.bousbaa@amsterdamumc.nl

ID 204- Cultural Challenges and Ethical Reflection in Hospice Training: Building Humanistic Competence among Family Medicine Residents in Taiwan

Ju Chien JENG, Po Tsung HUANG

Department Of Community And Family Medicine, China Medical University Hospital, Taichung City, Taïwan, République de Chine

Context: In Taiwan, where discussing death remains culturally sensitive, family members often request all possible treatments as an act of filial piety. Such expectations make it difficult for doctors to engage in open goals-of-care discussions or to focus on comfort-oriented treatment. Family medicine residents working in hospice wards frequently face moral distress when they encounter requests for non-beneficial interventions or when they struggle with their own beliefs about what constitutes good and compassionate care at the end of life.

Methods: This reflection is based on the author's experience supervising hospice training in a tertiary medical center. Residents complete a three-month daytime rotation and one year of night duties in the hospice unit. The program includes daily interdisciplinary rounds, weekly team meetings with nurses, dietitian, psychologist, social worker and Buddhist chaplain, and monthly ethics conferences. Ethical reflections apply the four principles-non-maleficence, beneficence, autonomy, and justice-to analyze cases involving medical futility, surrogate decision-making, and cultural expectations.

Originality: Few residency programs in Asia integrate structured ethical reflection into hospice education within a Chinese cultural framework. This model demonstrates how moral reasoning, cultural understanding, and emotional awareness can work together to cultivate

Lessons learned and future implication: Residents became more confident in initiating goals-of-care conversations, more patient and empathetic with families, and more aware of their own professional values about life and death. Integrating culturally sensitive ethics and death-literacy education

Discussion: Ethical reflection within palliative education provides a structured way for residents to explore moral distress, share emotions, and understand the influence of cultural norms on clinical decisions. It strengthens teamwork and empathy, allowing trainees to balance professional responsibility with respect for diverse values, which embodies the humanistic principles central to family medicine and primary care.

Conclusion: Embedding ethical reflection in hospice training transforms moral struggle into professional growth. By addressing cultural challenges with humility and compassion, family medicine residents can develop the humanistic competence required for equitable, person-centered end-of-life care.

ID 341- The 7 Habits of Great Family Doctors: Insights from a Global Survey of 468 GPs

Florian STIGLER

Golden Nuggets, Stockerau, Autriche

Context: Defining and cultivating “excellence” in family medicine is challenging, especially across diverse health systems and cultures. Practical, experience-based wisdom from frontline GPs may help clarify what really matters in everyday family medicine.

Objectives: The study's objectives were to collect, analyze, and distill the "single best piece of advice" from a large, international cohort of GPs to identify the key habits and principles valued most by experienced practitioners.

Methods: A global, anonymous survey was distributed via the Golden Nuggets, WONCA World, and WONCA Europe newsletters. 468 Family Doctors from 48 countries participated, providing 531 pieces of advice. This qualitative data was thematically analyzed, with responses rephrased, counted, and grouped to distill the most common recommendations.

Results: The analysis distilled the advice into seven primary habits. The most frequently recommended habit, by a significant margin (shared by 127 GPs), was "First, Listen," emphasizing the diagnostic and rapportbuilding power of uninterrupted listening. Other key habits included "Cultivate Your Network" (54 GPs), "Embrace the Examination" (34 GPs), "Relationship = Superpower" (30 GPs), "Learn Continuously" (30 GPs), "Trust Your Intuition" (23 GPs), and "Take Care of Yourself" (19 GPs).

Discussion: This study crystallizes the global GP community's wisdom into an actionable framework. Across countries and systems, experienced GPs converge on a small set of relational, reflective, and self-care habits as the foundation of excellent family medicine. However, selection bias is inherent to the recruitment method (newsletters), potentially favoring GPs active in international networks, and the identified habits reflect subjective professional consensus rather than objectively measured clinical efficacy.

Conclusion: The findings provide a practical, peer-validated framework for professional development that can be integrated into clinical practice to improve patient care and physician well-being.

Corresponding author: Florian Stigler, florian.stigler@family-medicine.org

ID 263- The profile and characteristics of the good doctor: synthesis of recent systematic and umbrella reviews

Alberto PARADA

Université De Liège , Ssmg, Liège, Belgique

Context: Recent systematic and umbrella reviews converge toward a multidimensional understanding of the “good doctor,” encompassing medical expertise, interpersonal competencies, motivation, and ethical values in general practice and family medicine. Keywords: Empathy; Professional competence; Physician-patient relations; Ethics; Motivation

Objectives: To synthesize evidence from systematic and umbrella reviews describing the key dimensions and attributes that define the good doctor across clinical competency, interpersonal communication, motivation, and professionalism.

Methods: We performed a review of published systematic and umbrella reviews indexed in PubMed, Embase, and Scopus between 2010 and 2024 focusing on professional and human factors in general practice. Reviews were selected using inclusion criteria: reports addressing physician attributes, skills, values, and their impact on patient or educational outcomes. Data extraction and thematic synthesis identified recurring dimensions (clinical competence, communication, motivation, personality, ethics). Citations included Khawar et al. (2022), Steiner-Hofbauer et al. (2017), Ibanez et al. (2010), Chukwuma et al. (2020), Janssen et al. (2020), Huber et al. (2020), Mutmainnah et al. (2023).

Results: Key dimensions describing the good doctor include: clinical expertise (knowledge, pragmatic decision-making, and complex patient data management), organizational skills (teamwork, supervision, and time management), interpersonal qualities (active listening, clear communication, empathy, respect, and collaboration), motivation and personal development (curiosity, continuous learning, willingness to recognize limits, and patient engagement), and personality/values (empathy,

kindness, honesty, humility, and ethical conduct). These attributes are recognized by multiple stakeholders, including patients, peers, and students. Empathy, communication, and integrity are universally cited as fundamental hallmarks.

Discussion: The synthesis demonstrates growing consensus on a holistic profile for the good doctor, balancing clinical skill, relational competence, lifelong learning, and ethical integrity. However, expectations may vary depending on stakeholder perspective and local context. Future training and assessment models should foreground both professional expertise and humanistic qualities.

Conclusion: The good doctor is defined by an equilibrium between clinical competence, interpersonal skills, motivation for improvement, and ethical values. Empathy, communication, and integrity remain universally essential in contemporary medical practice.

Gastroenterology

ID 1650- Challenges in the Diagnosis and Management of Adults with Chronic Constipation in Primary Health Care

António CARNEIRO [(1)] , Rute GOMES [(2)], Raquel SANTOS [(1)], Renata RIBEIRO [(1)], Teresa PINHO [(1)], Beatriz ALMEIDA [(1)], Leonor CARVALHO [(1)], Vítor MARTINS [(1)], Diana MARTINS [(2)], Paula MINISTRO [(2)]

(1) Usf Viriato, Uls Viseu Dão Lafões, Viseu, Portugal
(2) Gastroenterology Department, Uls Viseu Dão Lafões, Viseu, Portugal

Context: Constipation is a highly prevalent condition in Western populations and may be difficult to manage, significantly impairing quality of life and generating substantial healthcare costs. It is a common reason for seeking medical care, with Family Physicians (FPs) playing a central role.

Objectives: This study aimed to characterize FPs' knowledge, beliefs, and attitudes regarding adult constipation, identify the treatments most frequently prescribed, and explore barriers and facilitators to its diagnosis and management.

Methods: A cross-sectional study was conducted using an online survey administered to FPs addressing constipation management in the primary healthcare (PHC) setting. An original 18-item survey was developed through Delphi methodology by specialists in Gastroenterology and Family Medicine. A total of 100 responses were analyzed, including sociodemographic data, screening, treatment practices, perceived clinical importance and barriers to management.

Results: The median age of respondents was 31 years (28-37); 56% were female, 60% were residents, 12% were specialist with under 5 years of practice, and 28% were specialists with over 5 years of practice. Most respondents (64%) reported performing targeted anamnesis in some patients with risk factors, 32% in almost all patients with risk factors, and 4% in few or none. Sixty percent considered constipation extremely important, and 80% felt moderately informed about its treatment. Lactulose (52%), polyethylene glycol (20%) and bisacodyl (20%) were the most frequently prescribed medications. Major barriers included presence of multiple problems to manage and reliance on patients to initiate discussion. Suggested improvements included referral criteria (32%), diagnostic and treatment algorithms (24%), and patient educational leaflets (24%).

Discussion: This study reveals a gap between the perceived importance of constipation and its practical management in PHC. Constipation remains underdiagnosed and inconsistently addressed, often due to time constraints and reliance on patients to raise the issue. Although physicians report moderate knowledge, treatment choices are limited, favoring traditional laxatives and empyrical approaches over first-line medications. Practical tools, structured algorithms, and patient education may improve screening, treatment consistency, and patient engagement in PHC setting.

Conclusion: Although FPs recognize constipation as a relevant condition, its diagnostic and therapeutic management appears insufficient. Structured educational strategies and practical tools may improve care in PHC.

ID 1665- Asking does not offend – Screening for Adult Fecal Incontinence in Primary Health Care

António CARNEIRO [(1)] , Rute GOMES [(2)], Raquel SANTOS [(2)], Renata RIBEIRO [(1)], Teresa PINHO [(1)], Beatriz ALMEIDA [(1)], Leonor CARVALHO [(1)], Vítor MARTINS [(1)], Diana MARTINS [(2)], Paula MINISTRO [(2)]

(1) Usf Viriato, Uls Viseu Dão Lafões, Viseu, Portugal
(2) Gastroenterology Department, Uls Viseu Dão Lafões, Viseu, Portugal

Context: Fecal incontinence (FI) is a debilitating condition with significant impact on quality of life, associated with reduced self-esteem, social isolation and depression. Most affected patients do not seek medical care, making recognition by Family Physicians (FPs) crucial to improving access to treatment. However, data on FI management in Portuguese primary healthcare (PHC) are limited.

Objectives: To assess FPs knowledge, beliefs, attitudes, perceived barriers and facilitators in the diagnosis and management of adult FI.

Methods: A cross-sectional study was conducted using an online survey administered to FPs regarding their approach to FI in PHC. An original 12-item survey was developed using Delphi methodology by specialists in Gastroenterology and Family Medicine. Ninety-six responses were included. Sociodemographic data, screening and treatment practices, perceived clinical importance and barriers to FI management were analyzed.

Results: Median age of respondents was 30 years (28-37); 56.3% were female; 40.6% were residents, 18.75% were specialists with under 5 years of practice, while 25% were specialists with over 5 years. Only 6.2% reported performing targeted anamnesis for FI in almost all patients with risk factors, whereas 46.9% in some patients and 46.9% in few or none. Although 93.8% considered asking about FI to be of moderate or extreme importance, 84% self-reported being slightly to moderately informed and 12.5% not informed about diagnosis and treatment. The main barriers identified were limited consultation time (78.1%), perception of low prevalence (59.4%), lack of knowledge (54.2%) and reliance on patient-initiated discussion (51%). Suggested improvement strategies included referral criteria (80.2%), educational materials for FPs (78.1%) and diagnostic and treatment algorithms (72.9%).

Discussion: This study demonstrates a gap between FPs recognition of FI as clinically relevant and its assessment in PHC, resulting in underdiagnosis despite risk factors, high prevalence and impact on quality of life. Time constraints, perceived low prevalence, stigma and reliance on patient-initiated discussion were considered key barriers. Limited physician knowledge further hindered proactive screening. Respondents emphasized the need for practical tools and training. Limitations include self-reported data, cross-sectional design, potential selection bias and limited generalizability.

Conclusion: Overall, while FPs recognize FI as relevant, enhanced training and practical tools are needed to improve diagnosis and management in PHC.

ID 1938- Prevalence of Drugs for Acid-Related Disorders Usage and Side Effect Assessment

Mert CAKIR, Huseyin BALCIOGLU

Eskisehir Osmangazi University, Eskisehir, Türkiye

Context: Acid suppressant drugs, mainly proton pump inhibitors (PPIs), histamine type-2 receptor antagonists (H2RAs), and antacids, are among the very frequently used medications in society for various indications. Although generally considered safe, the long-term use of PPIs, in particular, has been associated with various diseases and disorders.

Objectives: This study compared chronic disease prevalence, common side effects, and lifestyle factors between adult patients using acid suppressants and a control group, while also identifying side effects associated with specific medications.

Methods: The data were collected from 175 patients using a face-to-face questionnaire method.

The collected data were analyzed using the IBM SPSS Statistics 23 program. The Chi-square test was used for categorical variables. The level of statistical significance was set at $p<0.05$.

Results: Of the 28.6% using acid suppressants, pantoprazole (36%) and esomeprazole (24%) predominated. Common indications included NSAID use and dyspepsia (38% each). A cid supressant usage linked significantly to hypertension, cardiovascular disease, and osteoporosis (p values were 0.05 , 0.006 , and 0.021 respectively). Pantoprazole use was positively associated with complaints of constipation and dizziness compared to the group not using pantoprazole (p values were 0.025 and 0.002 respectively). Additionally, gas and bloating complaints were statistically significantly more frequent in pantoprazole users compared to esomeprazole users (p=0.024).

Discussion: The rate of acid supressant drug use in our study is consistent with previous studies. The indications for acid suppressant drug use (such as NSAID use) are consistent with the literature.Given that PPIs accounted for 88% of the acid suppressants in our cohort, our findings regarding comorbidities like hypertension are consistent with established literature on PPI-related risks. Most existing literature evaluates PPIs as a class rather than investigating molecule-specific effects. Consequently, data supporting our observed associations between pantoprazole and side effects like constipation, dizziness, gas and bloating remain sparse.

Conclusion: Clinicians should consider switching from pantoprazole to alternative PPIs or H2RAs in patients with constipation, gas, bloating, and dizziness. We can try the safer H2RAs instead of PPIs for an appropriate indication in patients with osteoporosis, hypertension, and cardiovascular disease or those with multiple risk factors for developing these diseases.

ID 1877- Primary Care Audit on Helicobacter pylori infection in children: review of adherence for diagnosis and treatment as per ESPGHAN-NASPGHAN guidelines.

Subir GHOSH

Nhs,u.k., Braintree,essex, Royaume-Uni

Context: H. pylori colonisation in children does not cause gastroesophageal reflux or functional abdominal pain. General Practitioners often finds it difficult to distinguish dyspeptic symptoms from peptic ulcer disease during consultation leading to stool antigen testing for H. pylori. In the last two decades, antibiotic resistant H. pylori have emerged resulting in decline in efficacy of standard treatment regimens. There is no specific guideline in UK about retesting after treatment for microbiological clearance. In the UK, NICE and BNF guidelines on testing and treatment recommend treatment of H. pylori to reduce risk of peptic ulcer bleeding. One-week triple therapy regimen is recommended. There is no recommendation for re-testing. ESPGHN/NASPGHN recommends against non-invasive testing in absence of peptic ulcer disease. Diagnosis should be based on histopathology using Sydney system or on the basis of culture. Test to confirm eradication should be done after 6-8 weeks of completion of therapy.

Objectives: To evaluate current practice of diagnosing and managing Helicobacter pylori infection in children at our practice and compare with ESPGHAN-NASPGHAN guidelines.

Methods: Retrospective 12 months audit (May 2024 – April 2025) of our paediatric patients (under 18 years) who had Helicobacter pylori testing and reviewed reason for testing, documented clinical findings, testing method, treatment of test positive cases and re-testing to confirm eradication.

Results: 10 children were tested in the 12 month period. Reasons for testing were documented in 100% of cases but only 40% had abdominal pain. Clinical findings were recorded in 80% and in 20% patients were not examined. Testing method was stool antigen test in all cases. 100% of test positive cases were treated with 1 week of triple therapy. Test of eradication was not performed at all.

Discussion: In this audit 60%, H. pylori tests were carried out without specific indication. In 20% cases

no clinical examination was performed. Confirmation of eradication was 0%.

Conclusion: H. pylori testing in children should be done only if history suggests peptic ulcer disease. Re-testing at least 4 weeks after antibiotic and 2 weeks after PPI treatment is required.

Corresponding author: Subir Ghosh, subirghosh@nhs.net

ID 581- MASLD management in primary care

Waqas TAHIR [(1)], Pinar TOPSEVER [(2)] , Samuel SEIDU [(3)]

(1) Affinity Care, Bradford, Royaume-Uni
(2) Acibadem University, Istanbul, Türkiye
(3) University Of Leicester, Leicester, Royaume-Uni

Context: MASLD, previously known as non-alcoholic fatty liver disease (NAFLD), is increasingly prevalent worldwide, closely associated with obesity, type 2 diabetes, and metabolic syndrome. Primary care providers (PCPs) play a critical role in early detection, risk stratification, and management, yet clinical guidance in the primary care setting remains variable.

Objectives: To summarize current evidence-based strategies for the diagnosis, risk assessment, and management of MASLD in primary care and to provide a framework for practical implementation.

Methods: A narrative review of recent literature, clinical guidelines, and expert consensus statements on MASLD management in primary care was conducted. Key sources included PubMed, guideline documents from the American Association for the Study of Liver Diseases (AASLD), European Association for the Study of the Liver (EASL), and primary care-focused reviews published in the last five years.

Results: Screening and Diagnosis: MASLD should be suspected in patients with obesity, diabetes, dyslipidemia, or metabolic syndrome. Initial evaluation includes liver function tests and non-invasive fibrosis assessment using scores such as FIB-4 or NAFLD fibrosis score. Lifestyle Interventions: Weight reduction of 7–10% through dietary modification, increased physical activity, and behavioral interventions remains the cornerstone of management. Pharmacologic Therapy: Pharmacological interventions specifically for MASLD; however, insulin sensitizers (e.g., pioglitazone) and GLP-1 receptor agonists may be considered in select patients with comorbid metabolic disease. Comorbidity Management: Optimizing glycemic control, blood pressure, and lipid profile is essential. Referral: Specialist referral is indicated for advanced fibrosis (F3–F4), cirrhosis, or diagnostic uncertainty.

Discussion: Primary care is pivotal for early MASLD identification and intervention. Non-invasive fibrosis screening enables risk stratification without overburdening hepatology services. Lifestyle interventions, though challenging to implement, provide the most consistent evidence for improved outcomes. Pharmacologic interventions should be individualized and integrated with metabolic comorbidity management. Education and patient engagement are critical to success.

Conclusion: MASLD is a common yet under-recognized condition in primary care. PCPs can effectively manage MASLD through early detection, risk stratification, lifestyle interventions, and optimization of metabolic comorbidities. Structured protocols and use of non-invasive fibrosis tools can improve patient outcomes and reduce progression to advanced liver disease.

ID 827- Factors Associated with Trepidation During FODMAP Reintroduction in Patients with Irritable Bowel Syndrome.

Yen HSU [(1)] , Lee MARTIN [(2)]

(1) (886)937296668, Taichung, Taïwan, République de Chine
(2) 02034479289, London, Royaume-Uni

Context: IBS is a prevalent GI disorder within the broader category of Disorders of Gut-Brain Interaction (DGBI), affecting over 40% of the global population. The low FODMAP diet is considered an effective intervention for alleviating IBS symptoms,

but reintroducing FODMAPs can provoke fear in some patients.

Objectives: The restrictive nature of the low FODMAP diet may increase the risk of avoidant/restrictive eating patterns, making FODMAP reintroduction psychologically stressful for some individuals. This study aims to examine how dietary restriction, patient symptoms, and psychological factors contribute to fear during the reintroduction phase, offering insights that may help predict individual trepidation responses.

Methods: This study included participants who attended FODMAP group education sessions at University XXXXX Hospital between 2015 and 2020. The study used various questionnaires to assess IBS-related gastrointestinal symptoms, psychological problems, and dietary behaviors. Participants completed a baseline questionnaire before starting the low FODMAP diet and a follow-up questionnaire after the restriction phase, focusing on their concerns and experiences regarding the reintroduction of FODMAPs.

Results: The study included 150 participants, with a female majority (77.3%). The mean age of all participants was 45.6 years old. Notably, 45.3% of participants reported trepidation prior to reintroducing FODMAPs into their diet. Over two-thirds found that the low FODMAP diet restricted their dietary variety and increased their sensitivity to FODMAPs when they eat them. Patients with trepidation toward reintroducing FODMAPs had a higher risk of eating disorders (17.1% vs. 8.9%, $p = 0.003$) and depression (17.0% vs. 4.3%, $p = 0.027$), as well as increased overall symptom severity and IBS severity scores ($p < 0.05$).

Discussion: The study reveals that fear of reintroducing FODMAPs is associated with more severe gastrointestinal symptoms, higher IBS severity scores, or an increased risk of eating disorders. Psychological factors—particularly depression and eating-disorder tendencies—played a major role in driving this trepidation, while dietary restriction alone did not predict fear of reintroduction.

Conclusion: Comprehensive IBS management should consider both psychological and physiological factors to reduce fear and improve patient outcomes.

ID 800- Addressing the multidimensional burden of Crohn's disease during GP consultation: feedback and expectations. A quantitative study among 254 patients in France.

Sabine BAYEN, Marc BAYEN, Camille POMEYROLS

Dmg Université Lille, Guesnain, France

Context: In 2022, Crohn's Disease concerns about 180.000 patients in France and its prevalence is expected to increase within the next five years, particularly in young adults. Beyond the digestive attempts, Crohn's Disease affects quality of life in a multidimensionnal manner. Extradigestive symptoms are often invisible and hidden to the GP, because patients may feel ashamed discussion them during consultation.

Objectives: To identify the most frequent and impactant symptoms experienced by patients with Crohn's Disease and the most symptoms considered by patients as taboo to discuss with the GP.

Methods: We conducted a quantitative translational descriptive study from 15 Septmber 2024 to September 2025 among adult consent patients with Crohn's Disease. The study received ethical approval in january 2025 and the link to the anonymious standardized questionnaire was distributed via Lime Survey software online among patient organization, as a flashcode in GP waiting rooms and offices. Data analysis was performed with BiostatTGV software.

Results: 400 patients returned their questionnaire among which 146 were incomplete. Overall 254 questionnaires have been analysed. Most of the participants were women (81%, n = 206).Half of the population was employeed (50¨%, n=128) and declared a last disease push as less than 6 months (51%, n=129) declared a disease duration of over 20 years (28% , n=70).While fatigue pain and diarrhea were the most frequent symptoms declared, the most difficult to adress with their GP were emotional difficulties,altered body image, and a reduced satisfaction of social life. From the free

commentaries, 153 sub-themes, 27 themes, 6 categories emerged concerning other invisibles symptoms and 343 sub-themes, 16 themes, 4 categories emerged concerninig the patients's expectation toward their GP.

Discussion: There is currently few litterature adressing the Crohn's disease burden in primary care. We based our study on an american research protocol (varma et al 2017) which explored 17 symptoms, but not sexual well bein, which we have added to our questionnaire as well as the experience of communication with their GP regarding these 18 symptoms.

Conclusion: We highlight the multidimensional burden of Crohn's Disease and the need to adress both visible and invisible digestive and extradigestive symptoms and needs with our patients.

ID 1311- A Multidisciplinary Primary Care Protocol to Reduce Recurrent Falls in Older Adults—A Scoping Review to Assess Alignment With Current Evidence

Clara BLANCHARD, Andrea POPPELIER, Matthieu DESCAMPS, Jessica THEVIN, Claire DELFORGE, Aline PARIS, Alexandre PEYRIDIEUX, Karine GIRARD, Pauline VILLIERS

Mspu Coeur De Saintonge, Pont L Abbe D Arnoult, France

Context: Falls among older adults are frequent and impact on morbidity, mortality and loss of autonomy. In Nouvelle-Aquitaine, 17.658 fall-related hospitalisations were recorded in 2020. These events disproportionately affect vulnerable populations, raising issues of equity in access to prevention. While hospital-based pathways are well-documented, few fall-prevention protocols are adapted to primary care. To address this gap and foster coordinated, community-based care, the multiprofessional primary care centre Cœur de Saintonge developed the ReCHUTEPA protocol, offering adults aged ≥60 years a structured multidisciplinary approach designed to reduce recurrence of falls.

Objectives: To assess whether the ReCHUTEPA protocol aligns with evidence-based recommendations for managing older adults after a fall in primary care.

Methods: A scoping review was conducted using PubMed and Cochrane databases. Articles published between 2015 and 2025 were included if they involved adults aged ≥60 years, who had documented a fall, if interventions were feasible in primary care. Data extraction and analysis followed PRISMA methodology.

Results: ReCHUTEPA already integrates the major components identified in the literature: functional rehabilitation, medication review, nutritional evaluation, cognitive screening, orthostatic hypotension testing, footwear and vision assessment, vitamin D evaluation, and home environment adaptation. The review highlighted additional areas to reinforce: assessment of fear of falling (s-FESI), pain, urinary incontinence, and hearing, as well as systematic involvement of caregivers—an essential component of equitable and collaborative care. Evidence also supports strengthening balance- and strength-focused training (Otago, Tai Chi) and medication review using Beers or STOP-Falls criteria. Fall-risk stratification emerged as a key recommendation to guide personalised care pathways.

Discussion: The findings show that ReCHUTEPA is broadly consistent with current evidence. Its design reflects a pragmatic balance between comprehensive multidisciplinary care and the practical constraints of staffing and public health resources in general practice. Importantly, the programme is entirely free for patients, removing financial barriers and promoting equity in access to fall-prevention strategies. Incorporating additional recommended assessments may further enhance autonomy and ensure that all older adults—regardless of socioeconomic status—can benefit from appropriate, tailored interventions.

Conclusion: ReCHUTE PA is a feasible and equity-oriented protocol for managing older adults after a fall in primary care. Updating it based on this review may strengthen its effectiveness.

ID 1179- Co-creating a home-based network care intervention for frail older adults with heart failure

Lucien SANCHEZ VAN KAMMEN, Sara SOLDAN, Lara BOS, Heleen WESTLAND, Geert-Jan GEERSING

Julius Centre, Utrecht, Pays-Bas

Context: Frail older adults have a high risk of rehospitalization following a hospital stay for heart failure (HF). The transition from hospital to primary care may be improved through patient-centred, home-based network care after discharge. World Cafés (WC), are a method for the co-creation of complex interventions with stakeholders. This study ecplores the use of WCs for the development of a patient-centered, home-based, network care intervention for frail older adults with HF.

Objectives: To develop a patient-centered, home-based network care intervention for frail older adults with HF, which can be integrated into the current practice of patient care in the XXX region. Subsequent studies will test the intervention's feasibility and impact on rehospitalizations and quality of life.

Methods: Three sessions will be organized following the World Café principles of Brown and Isaacs (1) set the context; (2) create a hospitable space; (3) explore questions that matter; (4) encourage contributions; (5) cross-pollinate; (6) identefy patterns; (7) harvest and share discoveries. Each WC will consist of 12–15 participants, including healthcare professionals, patients, and caregivers. The first two WCs will identify key components of home-based network care for frail older adults with HF and how these can be applied in practice in the XXX region. Transcripts and field notes of the WCs will be analyzed by two resachers using inductive content analysis. Based on this analysis, a prototype of the intervention is crerated. At the third WC the intervention is finetuned untill consensus is reached among participants.

Results: We will present a qualitative analysis of stakeholder views on home-based network care for frail older adults with HF and its potential application in the XXX region, as well as the co-created protocol for the network care intervention.

Discussion: We expect that the WC method will lead to an intervention feasable in the current reality of patient care in the XXX region. Special attention should be given to creating an equitable environment to ensure patient-centered dialogue and outcomes.

Conclusion: At submission, data collection is ongoing and will continue until April 2026. At the conference, we expect to be able to present the final outputs of all WC sessions.

Corresponding author: Lucien Sanchez Van Kammen, l.sanchezvankammen@umcutrecht.nl

ID 171- Transforming behavioral challenges to promote equity in neurogeriatric care

Yesmine FERIANI, Zeineb FOURATI, Dalenda CHERNI-GHERISSI, Barbara MAAKAROUN, Lisette VOLPE-GILLOT

Pole Hospitalier Léopold Bellan, Paris, France

Context: In neurogeriatrics, clinicians care for patients with cognitive decline, reduced autonomy, and limited communication, making them vulnerable to inequity and emotional neglect. Our team questioned how to maintain equity, dignity, and staff well-being through collective reflection when verbal communication is no longer possible.

Methods: This practice-based reflection emerged from my integration into a neurogeriatric ward between August and November 2025. During this period, I worked closely with a multidisciplinary team and encountered patients with neurocognitive disorders and behavioral disturbances such as refusal of care, agitation, and verbal or physical aggression. These situations often led to caregiver exhaustion, disrupted routines, and family distress. To address these challenges, we implemented a person-centered, team-based intervention that included, negotiation-based care strategies, physical

activity, art therapy workshops, animal-assisted therapy and Snoezelen relaxation sessions with therapeutic touch and breathing techniques. Team strategies included regular case reviews, psychological support sessions for staff, and mutual assistance during complex care situations. Strengths included active team engagement, input from multiple healthcare roles and a focus on real-life holistic approach. Limitations were subjective data, a small sample size, and absence of patient feedback due to cognitive impairment.

Originality: Most studies on Behavioral and Psychological Symptoms of Dementia (BPSD) focus on single interventions or demographic inequities. Few examine how BPSD themselves create unequal access to care. This reflection is original because it highlights these inequities

Lessons learned and future implication: This experience showed that structured communication and coordinated teamwork can transform refusal of care into cooperation and improve equity by ensuring consistent access to care. Future work should adapt these strategies for general practice using si

Discussion: BPSD can create inequities by pushing teams toward task-focused care. A multidisciplinary approach can reduce these effects, but limited staff and high workloads make person-centered care difficult, as in general practice. Strong organizational strategies are therefore essential to support effective teamwork and workflows.

Conclusion: Strengthening teamwork and person-centered approaches can restore therapeutic alliance, support staff resilience, and promote more equitable care for vulnerable patients in neurogeriatrics.

ID 1024- Age-Specific Predictive Value of Body Mass Index for All-Cause Mortality: A 10-Year Cohort Study in Taiwan

Wan-Yi SHEN

Family Medicine Department, China Medical University Hospital, Taiwan, Taichung, Taïwan, République de Chine

Context: The relationship between Body Mass Index (BMI) and mortality has long been debated, with evidence suggesting a U- or J-shaped association. Among older adults, age-related physiological changes and comorbidities may modify this relationship. Understanding how BMI predicts mortality across age groups can guide clinical decision-making in primary care.

Objectives: This study aimed to examine the association between BMI and all-cause mortality across different age groups and to determine whether BMI remains a reliable predictor in older populations, particularly those aged ≥ 65 years.

Methods: This retrospective cohort study included 124,456 adults from a health check center in Taiwan. Baseline data included anthropometrics, socioeconomic status, laboratory results, and lifestyle factors. Participants were categorized into four age groups: < 65, 65–< 75, 75–< 85, and ≥ 85 years. Survival status over a 10-year follow-up was recorded. BMI was calculated as weight (kg)/height² (m^2). Student's t-test evaluated crude associations, and multivariable logistic regression was applied to assess the independent effect of BMI on all-cause mortality after adjusting for age, sex, lifestyle, and comorbidities (hypertension, diabetes, heart disease, and cancer).

Results: Among the participants, 47.2% were male, with a mean age of 42.89 ± 13.88 years and mean BMI of 23.10 ± 3.49 kg/m^2. During follow-up, 3.2% (n = 3,947) died, most commonly from cancer. BMI showed significant associations with mortality in the < 65, 65–< 75, and 75–< 85 groups (all P < 0.001), but not in those ≥ 85 years (P = 0.943). After adjustment, BMI was negatively associated with mortality in the 65–< 75 (OR 0.96, 95% CI 0.94–0.98) and 75–< 85 groups (OR 0.93, 95% CI 0.90–0.96).

Discussion: Findings suggest that higher BMI may confer a protective effect in older adults, consistent with the "obesity paradox." BMI loses predictive value in adults aged ≥ 85, possibly due to frailty, sarcopenia, and survivor bias.

Conclusion: BMI alone may not be a reliable mortality predictor across all age groups. In adults

aged 65–84, higher BMI appears protective, highlighting the need for age-specific interpretation of BMI in primary care.

ID 511- Factors influencing motivation among older adults to go for vaccination in Malaysia: A qualitative study based on the Theoretical Domains Framework

Wen Ting TONG, Zi Yi YEOH, Megat Mohamad Amirul Amzar Bin MEGAT HASHIM

Department Of Primary Care Medicine, Faculty Of Medicine, Universiti Malaya, Kuala Lumpur, Malaisie

Context: Despite the widespread benefits of vaccines, vaccination uptake among older people in Malaysia remains low. Currently, many studies on understanding factors influencing vaccine uptake focused on healthcare providers. Understanding the factors that shape motivation from the perspective of older adults is essential to designing effective interventions for this at-risk population.

Objectives: This study aims to explore factors influencing motivation to vaccination among older adults attending an urban primary care clinic in Malaysia.

Methods: This is a currently ongoing qualitative study. This study was guided by the eight domains associated with motivation in the Theoretical Domains Framework namely, Social and professional roles and identity, Beliefs about capabilities, Optimism, Beliefs about consequences, Reinforcement, Intentions, Goals, and Emotion. A total of five older adults (³ 60 years old) attending an urban primary care clinic were recruited. Semi-structured interviews were conducted, audio-recorded, and transcribed verbatim. A combination of framework and thematic analysis were conducted using the NVIVO software.

Results: Five themes emerged from the preliminary analysis: (1) Confidence in personal health resilience - participants believe their body is strong enough to tolerate vaccines; (2) Emotional confidence in health - older adults described emotional resilience, including a lack of fear of falling sick and optimism about their body's ability to handle vaccines; (3) Intention driven by practical benefits - motivation was enhanced when vaccines were free, reasonably priced, easily available, or required for travel; (4) Convenience as a motivational reinforcement - simplifying procedures such as shorter waiting times and easier access was perceived as highly encouraging, and (5) Identity based on social roles - participants' roles as caretakers, socially active individuals, or older persons influenced their decisions, shaping whether they viewed vaccination as a personal responsibility or a collective obligation.

Discussion: Enhancing convenience, addressing emotional concerns, strengthening informational self-efficacy, and recognising the influence of social roles may improve vaccine uptake among older adults. Data collection is still ongoing to refine the findings.

Conclusion: Motivation to vaccinate among older adults in Malaysia is multidimensional and deeply influenced by beliefs, emotions, intentions, and social identity.

Context: In primary care, patients frequently present with symptoms suggestive of obstructive sleep apnoea (OSA), but access to laboratory polysomnography (PSG) is limited and waiting times can delay treatment decisions. Scalable home-based tools could support GP-led triage and referral prioritisation, provided diagnostic performance remains consistent across common patient profiles such as sex, age and body mass index (BMI).

Objectives: To evaluate whether a chest-worn smartphone-based home sleep test maintains consistent performance across sex, age bands and BMI for moderate-to-severe sleep apnoea detection, and to report agreement for AHI severity classification versus PSG.

Methods: Post-hoc subgroup analysis of the XXX multicentre study per-protocol population (adults; N=432; 9 European centres). PSG (central adjudication) was the reference. Four-class AHI severity agreement used quadratic-weighted kappa. For AHI≥15 events·h^{-1}, overall performance was reported first as a benchmark, then subgroup sensitivity/specificity were examined by sex, age band and BMI.

Results: Overall severity agreement was high (weighted κ=0.878). For AHI≥15, sensitivity was 0.91, specificity 0.91, AUC 0.96 and Cohen's κ 0.81. Sex-stratified sensitivity/specificity were 0.918/0.868 in males (N=243) and 0.891/0.932 in females (N=189). BMI-stratified sensitivity/specificity were 0.893/0.944 in normal-weight (N=140), 0.859/0.872 in overweight (N=155) and 0.963/0.884 in obese (N=136). Age-stratified sensitivity/specificity were 0.938/0.929 (18–29; N=61), 0.904/0.900 (50–59; N=111), 0.912/0.880 (60–69; N=62), 0.909/0.500 (70–79; N=24; two PSG-negative) and 1.000/1.000 (≥80; N=4). Subgroup estimates were consistent with the overall benchmark.

Discussion: Across sex and BMI strata—including obesity—estimates were close to the benchmark, supporting consistent GP-led screening and triage across common primary-care profiles. The low specificity in ages 70–79 should be interpreted cautiously because it is driven by only 2 PSG-negative cases. Limitations include a referral-cohort setting and small older subgroups.

Conclusion: In a large multicentre PSG study, a smartphone-based home sleep test showed high agreement for AHI severity classification and consistent subgroup performance for moderate-to-severe sleep apnoea detection, supporting use for primary care triage. ID 1621- The Synectic Effect of Diabetes and Sarcopenia on Abnormal Sleep Duration in Middle-Aged and Older Adults

Shugang LI, Hao WU

School of General Practice and Continuing Education, Beijing, Chine

Context: With the accelerating aging of the population, abnormal sleep duration has become increasingly common among middle-aged and older adults. However, the mechanisms by which diabetes and sarcopenia, two highly prevalent chronic conditions, individually and in combination affect sleep health are not yet fully understood.

Objectives: To investigate the impact of sarcopenia and its comorbid status with diabetes on the risk of abnormal sleep duration in middle-aged and older adults.

Methods: Using longitudinal data from the China Health and Retirement Longitudinal Study (CHARLS) from 2011 to 2020, we included participants aged ≥45 years (n=4,936) and ≥60 years (n=2,061) with normal sleep at baseline. Cox proportional hazards models were employed to analyze the associations of sarcopenia (diagnosed according to AWGS 2019 criteria) and its various combined states with diabetes (diagnosed based on fasting plasma glucose) with the subsequent incidence of abnormal sleep duration (nighttime sleep duration <6 h or >8 h).

Results: Sarcopenia was significantly associated with an increased risk of abnormal sleep duration (HR=1.204, 95% CI: 1.023–1.417), particularly with long sleep duration (>8 h; HR=1.566, 95% CI: 1.192–2.057). The highest risk was observed in the group with comorbid diabetes and sarcopenia (HR=1.515, 95% CI: 1.059–2.167), with incidence rates of 49.3% in 2013, rising sharply to 80.0% in 2020. The risks were also significantly elevated in groups with prediabetes and sarcopenia (HR=1.423, 95% CI: 1.096-1.847) and with non-diabetes and sarcopenia (HR=1.279, 95% CI: 1.113-1.468).

Discussion: These findings suggest that the management of sarcopenia in the elderly should extend beyond physical function to include sleep health monitoring. Early combined interventions targeting prediabetes or possible sarcopenia may be an effective strategy for preventing abnormal sleep duration.

Conclusion: Sarcopenia is an independent risk factor for abnormal sleep duration. When comorbid with diabetes, especially prediabetes, the risk shows a further synergistic increase. Early identification and combined management of both conditions are crucial for improving sleep health in middle-aged and older adults.

ID 1583- Understanding the Insomnia Patient Journey in Europe: Survey Findings from Patients and Healthcare Professionals in Germany

Leonie MAURER [(1)] , Laurin RÖTZER [(1)], Daniela GAUTSCHI [(2)], Florent LAVERGNE [(2)]

(1) Mementor De Gmbh, Leipzig, Allemagne
(2) Resmed, Leipzig, Allemagne

Context: Fewer than 1% of patients with insomnia in Germany gain access to guideline-recommended care, Cognitive Behavioural Therapy for Insomnia (CBT-I), often only after prolonged delays.

Objectives: To illuminate what happens along the patient journey in the interim, this survey aimed to identify gaps in care, unmet needs, and potential levers to optimise provision in European primary care using Germany as a case example.

Methods: A standardised online survey was conducted between August and September 2024 among adults with insomnia and healthcare professionals. Patients were recruited via a digital health application they were currently using (XXX); healthcare professionals were recruited via newsletters.

Results: A total of 523 patients participated; 47.8% reported insomnia for more than five years. Before their first medical consultation, 92.2% had self-initiated measures to address sleep problems, including over-the-counter sleep medications (69.3%), relaxation techniques (65.2%), and sleep-hygiene practices (51.9%). In 59.9% of cases, patients sought medical support specifically due to sleep problems; 40.1% raised sleep in the context of other complaints. In 56% of cases, the first medical consultation occurred only after several years. Consultation resulted in a prescription for a sleep medication in 37.4% of cases; 14.1% reported regular use. Most respondents rated the possibility of discontinuing such medication as important. At the time of the survey, 40.5% had not received a formal insomnia diagnosis. Among 34 healthcare professionals, only 21.9% reported routinely diagnosing insomnia when sleep problems are present. Reported reasons included insufficient recognition of insomnia as a distinct disorder, knowledge gaps among clinicians, and low prioritisation in routine practice. Patient-side factors

(limited problem awareness, widespread self-medication) and structural barriers (restricted therapy availability, limited sleep-medicine expertise) were also cited.

Discussion: Despite long-standing symptoms, formal diagnosis is frequently absent, indicating deficits in patient awareness and systemic/structural weaknesses in care.

Conclusion: Strengthening professional awareness, expanding guideline-concordant therapy provision, and targeted patient education are essential to improve the patient journey in European primary care.

ID 1168- Investigation of consultations related to bedbugs in general practice and measurement of the psychological impact and repercussions on daily life, mainland France 2024-2025

Romain MARMORAT [(1)] , Titouan LAUNAY [(1)], Pascal DELAUNAY [(2)], Laurence FARDET [(3)], Patricia LEFÉBURE [(4)], Olivier STEICHEN [(5)], Bérenger THOMAS [(6)], Nadia YOUNÈS [(7)], Marion DEBIN [(1)], Thierry BLANCHON [(1)]

(1) Sorbonne University, Inserm, Pierre-Louis Institute Of Epidemiology And Public Health, Iplesp, F75012, Paris, France
(2) Parasitology-Mycology Department, Nice University Hospital, Nice, France
(3) Begin Military Hospital, Saint-Mandé, France
(4) General Practitioner, Limay, France
(5) Ap-Hp, Tenon Hospital, Internal Medicine Department, Paris, France
(6) Public Health Intern, Sorbonne University, Paris, France
(7) Inserm 1018, Cesp, Paris Saclay, University Of Versailles Saint-Quentin-En-Yvelines, Versailles Hospital, Versailles, France

Context: In France, a previous study estimated that 11% of households were infested by bed bugs between 2017 and 2022. In response to a potential resurgence of cases in 2023 and the anticipated tourist influx for the Paris 2024 Olympic Games, two complementary studies were commissioned by the french Directorate General for Health (DGS).

Objectives: The aim was to update incidence data in general practice and to assess the proportion of infestation in the general population, focusing on its psychological impact (PH-4 questions) and consequences on daily life (Sheehan Disability Scale).

Methods: Over the period from April 2024 to March 2025, 219 general practitioners (GPs) in mainland France weekly reported potential bed bug infestation cases. In addition, GPs were asked to send photographs of reported cases whenever possible. An entomologist and a dermatologist then conducted a consensus assessment to determine the relevance of the visual evidence and the coherence of the associated case description. The study in the general population surveyed all participants in an online cohort using a questionnaire to assess infestations and their impact on daily life.

Results: 129 cases were reported in general practice. Of the 57 cases reviewed by the two experts, 41 (72%) were classified as probable. Almost all cases (98%) reported an exacerbation of avoidance behaviors. 4,176 participants responded to the questionnaire in the general population from which 57 (1,4%) reported an infestation during the study period. The impact on daily life was relatively significant in both cohorts (36% in general practice ; 45% in general population).

Discussion: Preliminary data suggests that the number of bed bug-related consultations appears to have decreased since 2020, and the Paris 2024 Olympic Games period has not led to an increase in cases. The relatively high proportion of cases exhibiting a 'moderate to severe' impact on daily life in both parts of the study appears consistent with findings reported in the literature.

Conclusion: Our finding suggest that the sustained media attention reflects the profound psychological burden and the significant impairment of daily life caused by infestations, rather than a quantifiable increase in bed bug incidence across the country.

ID 203- Insomnia as a risk factor for the development of depression and anxiety in primary care: A matched population-based cohort study

Maria MEIJER [(1)] , Rutger MIDDENBURG [(1)], Ingrid ARNOLD [(1)], Jeanine KAMPHUIS [(2)], Dennis MOOK-KANAMORI [(1)], Mattijs NUMANS [(1)], Niels CHAVANNES [(1)], Robert SCHOEVERS [(2)], Jens VAN DALFSEN [(2)]

(1) Leiden University Medical Centre, Leiden, Pays-Bas
(2) University Medical Centre Groningen, Groningen, Pays-Bas

Context: While insomnia, depression and anxiety disorders are most frequently diagnosed and treated in primary care, the longitudinal relationship between these phenomena remains elusive for this setting.

Objectives: The aim of the present study was to quantify the association of registered insomnia with subsequent depression or anxiety in primary care.

Methods: A matched population-based cohort study was conducted using International Classification of Primary Care (ICPC) and Anatomical Therapeutic Classification (ATC) codes extracted from medical records of 84 XXX general practices. Patients without documented psychological or social problems, aged 18 to 65 years, with a registered insomnia diagnosis (ICPC: P06) or prescribed sleep medication (ATC: N05CD, N05CF, N05CH) were matched 1:1 to healthy controls on gender, year of birth, and general practice. Controls could be used more than once. The primary outcome measure was depression (ICPC: P03, P76, P76.02) or anxiety (ICPC: P01, P74, P74.01, P74.02) registration up to five years after the insomnia diagnosis.

Results: Patients with insomnia between 1 January 2010 and 1 January 2015 (n = 1,535) and the control group (n = 1,502) were followed for five years after the insomnia diagnosis. Patients with insomnia had a higher risk of depression or anxiety (odds ratio (OR) = 1.53, 95% confidence interval (CI) [1.18 – 1.98]).

Discussion: The present study identifies insomnia as a potential marker for early detection of depression and anxiety in primary care. In addition, treating insomnia accurately in this setting might reduce depression and anxiety incidences, as insomnia can be effectively and safely treated with Cognitive Behavioural Therapy for Insomnia (CBT-I), with more durable effects than sleep medication.

Conclusion: Patients with an insomnia diagnosis in primary care were at higher risk to develop depression or anxiety compared to healthy controls. Implementing prevention strategies that increase vigilance and improve insomnia treatment in primary care could reduce incidences of depression and anxiety on a population level.

ID 809- From Screening to Solutions: Addressing Sleep Health Challenges in Primary Care Practice

Anees ALYAFEI

Primary Health Care Corporation, Doha, Qatar

Context: Sleep disturbances, including insomnia and obstructive sleep apnea, are highly prevalent yet under-recognized contributors to morbidity in primary care populations. The growing burden of non-communicable diseases (NCDs) and evidence linking inadequate sleep with cardiometabolic, neurocognitive, and psychiatric disorders position sleep health as a core domain of preventive medicine.

Objectives: (1) To elucidate the mechanisms of sleep regulation and physiology relevant to clinical practice. (2) To characterize the spectrum and epidemiology of common sleep disorders encountered in primary care. (3) To evaluate the clinical impact of evidence-based sleep hygiene interventions.

Methods: Key scientific literature and multi-center epidemiological studies are reviewed to synthesize current knowledge on sleep architecture, diagnostic criteria for major sleep disorders, and validated screening tools, e.g., Pittsburgh Sleep Quality Index. Data is contextualized, focusing on the intersection of lifestyle factors contributing to disordered sleep.

Results: Insufficient and poor-quality sleep are independently associated with increased risks of hypertension, type 2 diabetes, obesity, depression, and cognitive decline. Evidence-based interventions—most notably regular sleep-wake schedules, targeted reduction of late caffeine and screen exposure, and optimizing sleep environment—demonstrate measurable improvements in subjective sleep quality, daytime functioning, and health outcomes across patient cohorts.

Discussion: Early identification and intervention for sleep disturbances are both feasible and impactful in the primary care context. The use of brief, validated questionnaires, coupled with practical sleep hygiene advice, can be systematically embedded into chronic disease management. Addressing sleep health in PHC is likely to yield synergistic benefits for metabolic, mental, and cardiovascular health, warranting its prioritization among preventive service strategies.

Conclusion: Strengthening sleep literacy among physicians is essential to improving patient care and population health. Integrating sleep assessment and management into routine practice empowers clinicians to address a frequently overlooked, yet highly modifiable, determinant of disease burden in primary care.

ID 377- Light therapy for insomnia : Insolux randomized controlled trial preliminary results

Juliette CHAMBE [1] , Aline HURTAUD [2], Cédric RAT [3], Manon REINBOLT [1], Guillemette DE THY [1], Laurence HUGUENY [4], Patrice BOURGIN [4]

(1) General Practice Department Of Strasbourg University, Strasbourg, France
(2) General Practice Department Of Reims University, Reims, France
(3) General Practice Department Of Nantes University, Nantes, France
(4) Circsom, Strasbourg University Hospital, Strasbourg, France

Context: Chronic insomnia raise issues by its complexity, and lack of access to non-drugs solutions. Alternative therapeutics are still expected, and light therapy appears as one of them : by its impact on sleep mechanisms, and its limited side effects. Our hypothesis was that light therapy could improve sleep quality of chronic insomniac.

Objectives: INSOLUX study aimed to evaluate active versus placebo light therapy on objective sleep efficiency of a large panel of insomniac patients. Secondary objectives were about other objective and subjective sleep parameters, as well as alertness and mood.

Methods: This randomized, double-blind controled trial was conducted by 40 GPs of 3 regions of France. They included 239 patients suffering from any type of chronic insomnia, with and without sleeping pills treatment. After 2 weeks of baseline, they were asked to use light glasses for 20 minutes in the morning, during 4 weeks : bright white blue enriched light of 2000 lux for active group, and dim red light of 150 lux for placebo group. A 2-weeks follow-up period completed the protocol. They wore an actimeter during the whole period, completed daily a sleep diary, and periodically questionnaires about mood, sleep quality, seasonality and chronotype. Analyses were conducted in intention to treat.

Results: Preliminary results show that the two groups are comparable for age, gender, use of sleeping pills, and associated conditions. No objective improvement of sleep parameters was observed on the whole population, on actimetry nor on sleep diary. Improvement of global sleep quality and mood was observed in both groups. There was a significant improvement of anxiety level in the active group compared to the placebo group at the end of the treatment and follow-up.

Discussion: These results do not show any objective effect on the quality of sleep in patients with insomnia in general. We hypothesize that certain types of insomnia (with difficulty falling asleep and/or waking up during the night) may respond better to light therapy than others.

Conclusion: Further analyses are planned to test this hypothesis and to take into account certain factors that may influence these results : seasonality, chronotype, changes in hypnotic use, exposure to natural light.

GP burden

ID 2093- Does following up patients who have experienced traumatic events in general medicine have an impact on the practitioner?

Jessica DUMEZ [(1)] , Emie GANIER [(2)], Erick GOKALSING [(3)]

(1) Faculté De Santé, Terre-Sainte, La Réunion, Boueni, Mayotte
(2) Faculté De Santé, Terre-Sainte, La Réunion, Terre-Sainte, Réunion
(3) Etablissement Public De Santé Mentale, Saint-Paul, Réunion

Context: Chronic exposure to human suffering at work takes a toll. The “compassion fatigue” as outlined by Figley as “the cost of caring”, it’s a profound exhaustion from others’ suffering that alters one’s fundamental beliefs. The general practitioner is on the front line of traumatic life stories and/or great suffering.

Objectives: In this study we sought to assess the risk of compassion fatigue among general practitioners (GP). Secondly, we looked for links between the Compassion Fatigue (CF) score and Burn Out score measured by the Compassion Fatigue and Satisfaction Test (CFST) as well as between the CF score and the professional empathy score measured by the Jefferson Scale of Empathy (JSE).

Methods: This is a cross-sectional, descriptive, quantitative study. To explore the risk of Compassion Fatigue among general practitioners, we used a questionnaire with three entities, the compassion fatigue test, the Jefferson scale of empathy and a professional and social questionnaire

Results: Of the 164 respondents, 72% were women, 47% were in a relationship, and 95% had a regular leisure activity. They reported for 70% experiencing personal trauma, and 50% reported having received psychological support. The study shows that 55.5% of the 164 respondents are at very high risk of compassion fatigue. The level of risk of compassion fatigue is significantly linked to practice structure, psychological support, and perceived quality of life. This score is linearly correlated with the risk of burnout. An inverse association is also shown: a low score on the JSE subsection "ability to empathize" is associated with a low CF score.

Discussion: This is a pilot study, the first study on the population of self-employed GP, which would need to be expanded nationally to limit biases and be more representative. The questionnaire title was neutral. Some GP expressed a lack of understanding of the subject, which probably led to a lack of interest from potential respondents.

Conclusion: GP are at very high risk of compassion fatigue in this study. Beyond the impact on physician's health, this is a major public health issue amid today’s declining access to care.

ID 1124- If the Helper Needs Help: the Second Victim Phenomenon in Estonian Family Medicine Workers

Tatjana MEISTER [(1)] , Kaja PÕLLUSTE [(2)], Kadri SUIJA [(3)], Ülle VOOG-ORAS [(4)], Inga KARTON [(1)], Heli-Kaja

KÜBARSEPP [(1)], Käthlin VAHTEL [(5)], Kristi SIIMSO [(6)], Eliise LEISMANN [(6)], Sofia KUZMINA [(6)]

(1) Institute Of Family Medicine And Public Health, University Of Tartu, Tartu, Estonie
(2) Institute Of Clinical Medicine, University Of Tartu, Tartu, Estonie
(3) Institute Of Family Medicine And Public Health, University Of Tartu; Institute Of Public Health And Clinical Nutrition, University Of Eastern-Finland, Tartu, Estonie
(4) Institute Of Dentistry, University Of Tartu, Tartu, Estonie
(5) Estonian Midwives Association, Tartu, Estonie
(6) Family Medicine Resident, Tartu, Estonie

Context: A second victim is any healthcare professional who has been directly or indirectly involved in an adverse event or medical error that caused harm to a patient or resulted in the patient's death, and who is negatively affected by the experience. The second victim phenomenon can lead to mental and physical health problems, reducing well-being and work ability.

Objectives: This study aims to determine the prevalence and influence of second victim phenomenon among primary health care setting in Estonia.

Methods: Data were collected through an online survey conducted from May 19 to June 30, 2025. Recruitment was conducted through professional associations, social media, and the press.

Results: Altogether, 133 primary health care workers responded to the questionnaire, of whom 71% were doctors. Among respondents, 62% (n=82) reported being a second victim, and most of them (63%) experienced this more than once. The leading causes were patient death (36%) and preventable harm (29%), while near misses or no-harm incidents were reported by 7%. One-fifth (20%) experienced aggression from patients or relatives. Only 41% of family medicine workers reported receiving support after incidence—mostly from colleagues or family. Leadership support was reported by 17%, and professional psychological help by only 4%. Common reactions included guilt (87%), self-doubt (83%), depressive mood (78%), concentration difficulties (66%), sleep disorders (57%), and social isolation (28%). Almost all respondents valued trained peer support (96%), emotional support from colleagues (95%), reflection on emotional and ethical values (95%), open and blame-free discussion (94%), legal counseling (94%), psychological care (90%), rapid debriefing (90%), and communication support (90%).

Discussion: Nearly all respondents expressed a strong need for employer-driven support to help them cope and maintain performance after an incident. However, only a small fraction received adequate institutional or professional assistance.

Conclusion: There is an urgent need for systemic changes and prioritizing the development of clear organizational protocols, mandatory peer-support programs, and access to psychological and legal counseling for primary health care workers suffering the second-victim experience.

Corresponding author: Kaja Põlluste, kaja.polluste@ut.ee

ID 568- Examining the issue of administrative burden experienced by general practitioners in Canada using national data

Taylor MCFADDEN, Ann VACHON, Emily KERE

Canadian Medical Association, Ottawa, Canada

Context: Physicians work significantly longer hours compared to the general population and are at a higher risk of burnout. One major pain point for physicians, particularly general practitioners (GPs), is the amount of time they spend on administrative tasks. Physicians go into medicine to help patients. Overburdening them with administrative tasks compromises their wellbeing and negatively impacts physician retention. A national administrative burden survey was distributed in July/August 2025 to examine the causes and impacts of administrative burden, as well as possible solutions.

Objectives: To examine the issue of administrative burden among GPs in Canada.

Methods: A cross-sectional survey was designed by individuals with research and subject matter expertise in administrative burden. The survey was distributed to Canadian physicians and medical learners through email distribution, social media

posts, paid advertisements, and by leveraging external partners who sent the survey to their own networks. The survey was open for three weeks, and received a total of 1,979 responses, including 782 GPs. Descriptive statistics were generated. Chi-square and t-tests were run to determine demographic differences according to area of practice.

Results: GPs spend 10 hours/week on administrative tasks and 4.7 of those hours are considered unnecessary. Only 16% of GPs have access to an individual who could help them complete these tasks. 53% indicated that in the last 12 months, time spent on administrative tasks has increased. This is concerning, as 91% of respondents indicate that clinical documentation contributes to physician burnout. Encouragingly, 42% of GPs are using an AI scribe tool, and an additional 33% who aren't using one yet are interested.

Discussion: GPs spend a significant amount of time on unnecessary administrative tasks, which may contribute to physician burnout. AI scribe tools may help reduce time spent on administrative tasks, but there remain several barriers that need to be addressed to increase uptake.

Conclusion: Administrative burden is a significant issue in healthcare that needs to be addressed to improve physician wellness, quality of patient care and health system sustainability. Data from this survey will inform national recommendations and advocacy efforts to reduce unnecessary administrative work and improve the daily realities of medical practice in Canada.

Corresponding author: Taylor Mcfadden, taylor.mcfadden@cma.ca

ID 500- Building a Peer Support Network for Family Physicians

Colleen GRADY [(1)] , Robyn BROWN [(2)], Laura DI QUINZIO [(2)], David PINKERTON [(3)], Mary MARTIN [(3)]

(1) Queen's University, Kingston, Canada
(2) Maple Family Health Team, Kingston, Canada
(3) Kingston Family Health Team, Kingston, Canada

Context: Peer support is valued as an intervention that builds upon human connection between peers who have similar experiences and can be trusted confidantes. As independent professionals, most family physicians have limited options to seek support, complicated by a culture that expects resiliency and self-management.

Objectives: The study purpose was to investigate the value and impact of local peer-support for family physicians and to explore how a close-to-home network of peer supporters could be sustained.

Methods: Participatory Action Research (PAR) approach to development, delivery, and evaluation of peer support training with mixed methods. A peer-support trained family physician facilitated both virtual and in-person training with participants gaining knowledge, expertise and practice to become peer supporters. Evaluation included surveys and interviews with participants.

Results: Seventeen physicians participated in the study. Benefits were attributed to the training phase, the overall value of peer support, and the importance of retaining a peer support program. Training sessions enhanced knowledge of participants by; 1) introducing a new way of listening, 2) promoted learning through a combination of didactic and experiential methods, and 3) learning new concepts related to peer support which increased confidence in supporting a peer. Peer support benefits included 1) feeling heard/validated, 2) feeling less alone, and 3) improved problem solving. Considerations for sustained peer support include 1) a low-cost intervention, 2) experienced facilitator and training necessary, 3) availability of trained peers, and 4) a community-based approach could reduce barriers to reaching out for support

Discussion: The outcomes from our study indicate that peer support is universally supported by participants. Immediate value was noted from the training received and the increased confidence to provide support to their colleagues with positive outcomes. Peer support programs can mitigate some of the current stressors within the family medicine environment and, through the human connection, reduce some of the associated stigma in reaching out.

Conclusion: Peer support is a viable, low-cost intervention which can decrease stress among family physicians. Expert training enables expansion

of peer support, with increased knowledge and confidence among those trained which could lead to a train-the-trainer approach for expansion and sustainability.

ID 464- Attentional fatigability over the working week among General Practitioners

Chloé COULON [(1)] , Brice FARAUT [(2)], Arnaud RABAT [(2)]

(1) Department Of General Practice, Faculty Of Medicine, Sorbonne University, Paris, France
(2) Paris-Cité University, Vifasom Erc 7330, Vigilance Fatigue Sleep And Public Health, Hôtel-Dieu, Ap-Hp, Paris, France

Context: General practitioners (GPs) face an increasing cognitive load, which exposes them to heightened risk of attentional fatigue, which may impair clinical decision-making and professional well-being. However, this phenomenon remains poorly studied in general practice.

Objectives: To measure the variation in sustained attentional fatigue as a function of time-on-task during the working week and to identify associated factors (work schedules, sleep duration, social jet-lag, perceived fatigue).

Methods: Quantitative observational study including 30 outpatient general practitioners, stratified according to the presence or absence of chronic sleep debt. Four repeated 25-minute Psychomotor Vigilance Task (PVT) sessions were performed by each participant: morning and end of day, beginning and end of week. This extended duration of the PVT, close to a real consultation, represents a relevant marker of sustained attention. Subjective fatigue was assessed by self-administered questionnaire pre- and post-task. Comparative models were used to examine the effects of time-on-task, timing of assessment, and sleep debt on performance.

Results: Interim analyses on 20 subjects revealed significant effects. Perceived sleepiness remained comparable between groups and stable throughout the week. However, objective measures showed that subjects with sleep debt exhibited impaired vigilance throughout the week compared to controls, who maintained stable performance with no morning/evening effect. Accumulated weekly sleep pressure exacerbated major attentional lapses in subjects with sleep debt.

Discussion: This study shed light on the cognitive mechanisms of underlying attentional fatigue in primary care and raises important questions about medical work organization, potential clinical effects of attentional overload, and long-term professional sustainability for GP's.

Conclusion: Attentional fatigue varies significantly according to sleep-wake patterns among GP's. Chronic sleep debt is linked to decreased cognitive performance and a higher frequency of major attentional lapses.

GP practical tools

ID 2284- Health in Sprint: Scrum Methodology and the OSGA Platform for Managing Indirect Contacts

Rui Diogo RODRIGUES, Ana PÓVOA, Alice AVANZO, Joana RAMINHOS, Beatriz MACHADO, Natacha MURINELLO, Diogo TAVARES, Marlene CALISTO

Usf Carcavelos, Uls Lisboa Ocidental, Cascais, Portugal

Context: Managing indirect contacts in Family Health Units (FHUs) via email is characterized by an unstructured workflow that is difficult to triage. This situation results in a critical clinical workload, involving the systematic reception of inappropriate or clinically irrelevant requests directly by physicians, such as private-sector exam transcriptions or administrative reports. The lack of filtering generates communication noise and compromises the team's operational efficiency.

Methods: To implement the OSGA platform (Orientation of Requests for Management and Support), utilizing the Scrum methodology, to structure request flows, reduce the volume of

inappropriate inquiries, and empower patients to access the healthcare system appropriately.

Originality: The project was based on the Scrum framework, with a cross-functional team consisting of a Product Owner, a Scrum Master, and a Developer. Through incremental cycles (Sprints), a Product Backlog was developed based on the real-world typification of receiv

Lessons learned and future implication: The use of informal channels prevents effective task prioritization. The OSGA platform acts as a pedagogical guide that directs patients based on their specific needs: it provides instructions on verifying active prescriptions via government health app "S

Discussion: The methodology established a process of continuous inspection and adaptation, allowing the platform to evolve dynamically based on ongoing feedback from both patients and professionals. The system functions as a pedagogical filter that teaches patients how to navigate the healthcare system, discouraging the use of email for situations that can be resolved through official channels. Qualitative feedback indicated a decrease in work-related anxiety.

Conclusion: The application of the Scrum methodology in the FHU proved to be a catalyst for organizational innovation. OSGA not only structured the workflow but also established a commitment to continuous improvement and patient education, proving fundamental for operational sustainability and health literacy in primary care.

ID 2122- Intelligent Automation of Administrative Workflows in Primary Care: Impact on Capacity, Safety and Workforce Sustainability

Nina JHITA, Vincent SAI, Mina GUPTA, Tom RATCLIFFE, Ryan BELL

Modality Partnership, Nationwide, Royaume-Uni

Context: Primary care faces escalating administrative workload that outpaces available workforce capacity. Manual processing of pathology results, prescriptions, registrations and clinical documents creates delays, reduces accuracy and contributes to staff burnout. To address these issues, we implemented an intelligent automation programme to reduce administrative burden and improve the working day through robotic process automation (RPA) operating across high-volume workflows.

Objectives: To evaluate the impact of intelligent automation on: Administrative workload (clinical and non-clinical) and task turnaround Clinical and non-clinical capacity release Standardisation and accuracy of administrative processes Workforce wellbeing and absenteeism

Methods: The evaluation was conducted across multiple primary care sites serving approximately 500,000 patients. A retrospective analysis was conducted using organisational automation logs from more than 35 automated workflows. Data included total automated tasks, hours saved, appointment equivalents generated, absenteeism trends and process consistency indicators. Tasks automated included registrations, prescription processing, document classification, pathology routing and administrative triage. Descriptive statistics were applied to assess operational, workforce and patient-facing outcomes.

Results: The automation programme processed more than 900,000 tasks across workflows, releasing over 55,000 hours of staff time. This equated to 30 whole-time-equivalent clinicians' time redirected from administrative work. Standardisation of automated workflows enabled an additional 330,000 appointments to be made available to patients by improving workflow throughput and reducing bottlenecks. Workforce impact was substantial: peak absenteeism reduced from 42% to 17%, and staff reported improved workload manageability and job satisfaction. Turnaround times improved across all automated pathways, leading to improved service continuity and patient experience.

Discussion: Intelligent automation delivered meaningful operational efficiencies while improving safety and consistency. Automation worked most effectively when paired with workflow redesign, real-time monitoring and staff engagement. Cultural and behavioural factors were more influential than technology in determining adoption speed. Performance varied across workflows, highlighting the need for iterative optimisation and local workflow readiness.

Conclusion: Large-scale automation of administrative workflows can significantly strengthen primary care capacity, improve the working day and enhance patient access. These findings demonstrate that intelligent automation is a scalable and cost-effective component of modern primary care operations. This model demonstrates a scalable approach to strengthening primary care delivery and may inform international efforts to modernise primary care.

ID 2080- AI-Enabled Digital Triage in Primary Care

Vincent SAI, Mina GUPTA, Nina JHITA, Tom RATCLIFFE, Sian KNIGHT

Modality Partnership, Nationwide, Royaume-Uni

Context: Practices faced increasing demand, rising appointment requests and growing pressure on reception and clinical teams. Multiple routes into the system—phone, walk-in requests, and limited online access—created inequity in how patients were prioritised. Those who could queue early by phone or in person were often seen first, while online requests were handled inconsistently or as a lower priority. Staff described the process as “unfair for patients and overwhelming for us.” A more structured, safe and equitable access model was needed.

Methods: Over 50 practices first mapped existing access routes and found significant variation in how requests were handled. The introduction of an AI-enabled digital triage system provided a single front door through which all appointment requests—online, telephone and face-to-face—were triaged consistently. To support patients with low digital confidence, practices enlisted digital champions from Patient Participation Groups to help individuals complete requests in waiting rooms. Early strengths included clearer prioritisation and improved visibility of clinical need. A limitation was the initial adjustment period for staff, who had to change long-established habits and trust a new workflow. Safety checks were embedded at critical points and concerns about clinical safety addressed in DTAC, DPIA and DCB0129/0160-aligned safety assessment.

Originality: Rather than introducing a purely digital access route, the model embedded digital triage into all contact channels, ensuring equity between digital and non-digital users. The approach created a unified system in which urgency—not arrival order—determined

Lessons learned and future implication: Digital champions drawn from patient groups became powerful advocates for adoption. Offering supported digital access in reception improved inclusion. Future work will focus on iterative refinement and extending triage logic.

Discussion: The experience demonstrates that digital triage can improve fairness and transparency when integrated into all modes of access. Engagement from both staff and patients was essential to redesigning safe and equitable pathways.

Conclusion: Consistent digital triage, taking <4mins per patient, has supported more than 500,000 patients through consistent decision-making and improved access equity; strengthening the ability of teams to manage demand safely with 76% patients offered appointments ≤7-days.

ID 1632- Digital Health Innovations: A Scoping Review of Non-Remunerated Technologies

Gemma SEDA-GOMBAU [(1)] , Brenda Biaani LEÓN-GÓMEZ [(2)], Candela SANCHO [(2)], Juan José MONTERO-ALIA [(2)], Anna MITJANS-GARCÉS [(3)], Prior-

Rovira ADRIÀ [2], Antoni CALVO [3], Meritxell CARMONA-CERVELLÓ [2], Liudmila LIUTSKO-PAVLECHKO [2], Pere TORÁN-MONTSERRAT

(1) Universitat Autònoma De Barcelona, Barcelona, Espagne
(2) Unitat De Suport A La Recerca (usr) Metropolitana Nord, Mataró, Espagne
(3) Col·legi Oficial De Metges De Barcelona, Barcelona, Espagne

Context: Healthcare systems worldwide are undergoing rapid digital transformation. Advanced technologies such as artificial intelligence (AI), big data analytics, and automation tools are increasingly integrated into clinical workflows to enhance diagnostic accuracy, streamline processes, and improve patient outcomes. While these innovations promise efficiency and quality of care, they also introduce challenges: increased cognitive workload, ethical dilemmas, and uneven implementation across institutions.

Objectives: To identify and characterize non-remunerated technologies implemented in clinical practice within the Catalan healthcare system, focusing on their purpose, context of use, and associated risks.

Methods: A scoping review was conducted following PRISMA-ScR guidelines. Searches were performed in Scopus, Web of Science, PubMed, and grey literature. Inclusion criteria targeted studies describing advanced technologies used in clinical settings without direct economic benefit for professionals. Data extraction classified technologies by type (e.g., AI diagnostic tools, electronic health records, automation systems), objectives, institutional context, and reported challenges. Findings were synthesized in a comparative matrix and validated through participatory knowledge exchange spaces (ECICs).

Results: The review identified widespread adoption of three main technologies: AI-based diagnostic systems for imaging and decision support, electronic health records integrated with predictive analytics and automation tools for administrative and clinical workflows. Reported benefits include improved efficiency and accuracy; however, concerns emerged regarding increased cognitive load, ethical dilemmas, and uneven implementation across institutions. Evidence suggests potential exacerbation of structural inequalities if integration lacks regulatory oversight.

Discussion: Non-remunerated technologies are transforming clinical practice, but their rapid implementation without adequate support may compromise professional well-being. Participatory strategies and institutional evaluation are essential to mitigate risks and ensure equitable adoption.

Conclusion: The integration of advanced clinical technologies is reshaping professional roles and care delivery in Catalonia. While these tools promise efficiency and improved patient outcomes, their rapid implementation without adequate institutional support may increase cognitive workload, blur boundaries between personal and professional life, and exacerbate psychosocial stress. Moreover, adoption is not neutral: structural inequalities related to gender, age, and employment conditions may influence access and impact, creating uneven benefits and risks. Ensuring equity in technology integration is essential not only for professional well-being but also for maintaining the quality and safety of primary care services.

ID 1226- Diagnostic accuracy of artificial intelligence compared to family physicians and dermatologists for skin conditions: a systematic review and meta-analysis

Roxane LIARD [1] , Norhane NADOUR [2], Théo DUGUET [2], Sophie ZAHEDI [2], Hugo FIGONI [2]

(1) Department Of General Practice, Sorbonne University, Paris, France
(2) Department Of General Practice,sorbonne University, Paris, France

Context: Artificial intelligence is increasingly used for skin-lesion image analysis. Because dermatology wait times are long, general practitioners serve as key gatekeepers for identifying skin diseases that require prompt treatment.

Objectives: This study aims to examine the diagnostic accuracy of AI in diagnosing skin lesions encountered in primary care and to perform a meta-analysis of AI's in diagnostic accuracy for melanoma detection.

Methods: This systematic review and meta-analysis, conducted according to the 2020 PRISMA guidelines, included diagnostic accuracy studies using any type of AI applied to photographs or dermoscopy images to diagnose skin lesions encountered in primary care settings. The reference standard was dermatologist consensus or histopathological examination. Searches were conducted in PubMed, Web of Science and Cochrane in December 2023. Risk of bias and concerns of applicability were assessed using the QUADAS-2 tool. Data extraction was conducted by two investigators and meta-analysis was performed using a bivariate random effects model.

Results: Between 2013 and 2023, 382 studies were found and 38 met the inclusion criteria.AI's accuracy was reported as non-inferior or superior to that of dermatologists in 30 studies (less acurate than dermatologists in 4 studies) . AI's accuracy was non-inferior or superior to that of GPs in 8 studies (less acurate than GPs in 1 study). AI for the diagnosis of melanoma had a pooled sensitivity of 0.86 (95% CI: 0.80–0.90) and a specificity of 0.94 (95% CI: 0.89–0.97). The diagnostic odds ratio was 44.36 (95% CI: 29.28; 67.1), with an AUC of 0.922 for the SROC curve. Of the 38 included studies, 25 were at high risk of bias, primarily due to patient selection. Datasets were frequently not representative of the outpatient population, as malignant conditions were often overestimated.

Discussion: The review followed PRISMA methods, yet constraints such as limited database access, reliance on MeSH-only searches, and scarce comparable source data reduced the robustness of the meta-analysis.

Conclusion: AI appears to perform at a similar level to dermatologists, and the same is true when comparing AI to GPs. This is especially true for serious conditions like melanoma, suggesting that AI could be a valuable tool for GPs in improving patient care.

ID 946- Design and assessment of an open-source tool to support diagnosis and management of vertigo in French primary care.

Eléanor PAZART

Département De Médecine Générale Dijon, Dijon, France

Context: Vertigo is a common complaint in primary care and significantly affects patients' quality of life. Its management is challenging due to the wide range of clinical presentations and etiologies, as well as the lack of practical, primary-care–oriented diagnostic guidelines. General practitioners (GPs), often the first point of contact and coordinators of care, face difficulties in efficiently evaluating vertigo during consultations. A dedicated, accessible decision support resource may help optimize clinical assessment in this setting.

Objectives: To develop a free, ergonomic, open-source online decision support tool designed to guide GPs in the evaluation and management of vertigo in primary care, and to assess its usability and perceived relevance in practice.

Methods: In 2023, the initial prototype was developed during a collaborative health hackathon involving physicians, developers, and engineers. The tool integrates an intuitive interface and a simple decision algorithm based on current recommendations, with expert validation. In November 2024, a nationwide acceptability study was conducted among French GPs using an online questionnaire. Usability was evaluated with the System Usability Scale (SUS). The tool is freely accessible and maintained as an open-source project to ensure transparency and equitable access. Ongoing work aims to update clinical content and the referral directory to improve patient pathways.

Results: The decision support tool created, has now been available online for more than one year. Among 78 respondents, the SUS score reached 84.01, indicating excellent usability. Participants reported that the tool was relevant, reliable, and easy to use. More than 65% expressed willingness to integrate it into routine practice, with strong interest among practitioners in rural and semi-rural areas.

Discussion: This innovative open-source resource aims to improve vertigo management in primary care by offering a practical, clinically grounded tool.

While based on stable clinical criteria, its digital nature requires vigilance regarding potential "e-iatrogenic" effects. Further research is needed to assess long-term impacts, including on the doctor–patient relationship.

Conclusion: The tool demonstrates strong usability and perceived usefulness. Its open-source framework and planned regular updates support accessibility, sustainability, and potential integration into everyday primary care.

Corresponding author: Eléanor Pazart, epazart@gmail.com

ID 638- Bridging guidelines and shared decision-making: development and evaluation of a web-based support tool for cardiovascular prevention in primary care

Nathan COLLANGE, Pierre DE BREMOND D'ARS, Meïdi KOUYA

Sorbonne Université, Paris, France

Context: Cardiovascular diseases are a major cause of mortality and morbidity. General practitioners play a key role in preventing these conditions, particularly by assessing their patients' cardiovascular risk and implementing preventive measures. However, applying increasingly complex guidelines is a challenge in daily practice. Existing digital tools are often outdated, are not suited to the diversity of patient profiles, and do not provide the visual support needed for effective shared decision-making.

Objectives: To design a clinical decision support tool ("XXX") for cardiovascular risk assessment in primary care and to evaluate its usability among physicians.

Methods: A web-based tool was developed, integrating ESC guidelines and specific risk scores to cover various clinical profiles. A cross-sectional study was conducted from April to July 2025 among physicians who used the website. Usability was assessed via an anonymous online questionnaire based on the standardized System Usability Scale (SUS). The primary endpoint was the SUS score, interpreted according to standardized thresholds (poor, acceptable, good, excellent). Subgroup analyses examined variations across sociodemographic and professional characteristics.

Results: The analysis included 357 physicians, 94% of whom were general practitioners. The mean SUS score was 91.9/100 (95% CI 90.9–92.9), significantly exceeding the threshold for "excellent" usability (> 85; $p < 0.001$). A small absolute difference was noted between genders ($p = 0.049$), whereas no significant differences were found according to age, professional status, or practice location.

Discussion: The high perceived usability suggests that XXX is well-adapted to the requirements of routine practice. Further research will be necessary to assess whether this usability translates into improved guideline adherence and shared decision-making in daily practice.

Conclusion: XXX is a new clinical decision support tool that has demonstrated excellent perceived usability. It is a promising resource to facilitate cardiovascular risk assessment and prevention in France.

Guidelines

ID 1979- How to transform a national guideline into a GP professional point of care synthesis: ebmfrance method

Agnes PELTIER [(1)] , Hélène HYRON [(2)], Laetitia GIMENEZ [(3)], Jean-Laurent THÉBAULT [(2)]

(1) Collège De La Médecine Générale, Grenoble, France
(2) Collège De La Médecine Générale, Paris, France
(3) Collège De La Médecine Générale, Toulouse, France

Context: [anonymised] is a French service from the [anonymised], composed of an editorial team of general practitioners (GPs) in partnership with the French National Authority for Health (HAS), among others. Since 2019, it offers a dynamic website featuring a collection of clinical practice guidelines (CPGs). This tool aims to facilitate shared decision-making in primary care.

Methods: Each quarter, the scientific council of [anonymised] brings together representatives from the HAS, the French national public health insurance system, and other GP scientific societies to pre-select national HAS guideline and adapt them into GP professional point of care synthesis: the CPGs, which are accessible for point-of-care decision making in GP. Working as a team, the editors select the information most relevant to GPs, restructure and summarize the content. Each GPC is then submitted to the HAS for validation, which reviews the content prior to publication and ensures that the proposals are consistent with the original content. Discussions and arbitration between the two parties take place if necessary. This procedure results in the creation of a GPC that is as readable and practical as possible. Examples applied to GPCs will be given during the presentation at each step of the described procedure.

Originality: The originality of [anonymised] lies in its codified collaborative approach with the leading French learned society about knowledge dissemination, bringing together GPs, health institutions, and scientific experts

Lessons learned and future implication: The strengths are the close and rigorous collaboration with the HAS, the editorial team composed solely of GPs, and free access to the GPCs. The challenges are the need for continuous updating and a necessary delay in the application of procedures. Experi

Discussion: [anonymised] is now a recognized tool for clinical decision support. However, challenges remain, particularly in terms of continuous updating.

Conclusion: [anonymised], in partnership with the HAS, offers an innovative model for shared decision-making in general practice. Its impact lies in providing accessible scientific knowledge, promoting better patient care.

ID 1663- Quality evaluation of French guidelines in primary care infectious disease: an AGREE II assessment

Kenza AKHAMLICH, Rémy BOUSSAGEON, Eulalie GILLET-LECOURT

Lyon Est, Lyon, France

Context: Antibiotic prescription, its nature and its duration are a very common decision-making situation in primary care practice. Clinical practice guidelines (CPGs) are regularly emitted by various organisations on this topic.

Objectives: Our goal is to run a quality appraisal of the current French guidelines, for the most common primary care infectious pathologies.

Methods: We collected all primary care CPGs that are currently prevailing in France through a systematic review of the french website Antibioclic®. For each of these guidelines, a quality assessment was run by 3 independent reviewers, by means of the Appraisal of Guidelines for REsearch & Evaluation II instrument (AGREE II). The main outcome was a 'reliability score', defined as the sum of the scores in domains 'rigour of development' and 'editorial independence'. To be considered 'reliable', the CPG had to reach a 60% threshold in these two domains. Secondary outcomes were : global quality score of CPGs, number and ratio of CPGs for which a systematic review has been conducted during its conception.

Results: Over the 43 CPGs that have been assessed, none reached the 60%-threshold as to the reliability score. Only one CPG (2.33%) gets an over-60% quality assessment in the domain of rigour of development (D3), whereas three CPGs (6.98%) reach this threshold in the domain of editorial independence (D6). One CPG (2.33%) met the quality threshold of 60% as to overall assessment. Rigour of development and editorial independence are the domains that obtained the lowest average score, respectively, 11% and 21%. Overall assessment received an average score of 29%. A systematic review of the literature was mentioned for 10 CPGs (23.26%).

Conclusion: Most French primary care infectious disease guidelines fail to reach the AGREE II quality threshold for rigour of development and editorial independence, and only about one quarter report having conducted a systematic literature review. As these criteria are essential to ensure guideline reliability, this raises major concerns regarding the

trustworthiness of current recommendations. Our findings suggest that primary care infectious disease guidelines would benefit from being revised with higher methodological standards and greater independence.

ID 519- Towards Inclusive Clinical Guidelines: Reflections on the Development of the NHG Inclusive Language Guide

Janneke VEEZE, Hanneke STAM, Ellen OLBERS

Dutch College Of General Practitioners, Utrecht, Pays-Bas

Context: The Dutch College of General Practitioners (NHG) promotes a healthcare environment in which diversity and inclusion (D&I) are acknowledged and valued. Language plays a crucial role. In clinical guidelines, the use of inclusive language can contribute to more equitable and respectful healthcare. However, guidelines of NHG were outdated and in several cases non-inclusive in the current cultural context. Recognizing this, the NHG has taken the initiative to develop an Inclusive Language Guide (Inclusieve Schrijfwijzer) as a foundational tool to support inclusive guideline development.

Methods: A multidisciplinary D&I working group was established to develop the guide. The process involved reviewing existing guidelines, identifying exclusionary language, and consulting with stakeholders from various communities. The guide offers practical recommendations for writing in a way that is respectful, non-stigmatizing, and sensitive to differences in gender, ethnicity, and socioeconomic background. Difficulties include the evolving nature of inclusive language and the challenge of consistent application.

Originality: Although inclusive language is increasingly recognized as important in healthcare literature, few organizations have developed a guide for clinical guideline authors. The NHG's approach is innovative in its integration of inclusion into the core of guidel

Lessons learned and future implication: Key lessons include the importance of organizational support, interdisciplinary collaboration, and ongoing reflection. The guide encourages caution in language use and promotes awareness of implicit bias. Future efforts will focus on embedding the inclusi

Discussion: This initiative aligns with the NHG's strategic vision in Visie Huisartsenzorg 2035, which promotes a care environment where diversity and inclusion among professionals and patients are valued, recognized and accomplished.

Conclusion: The NHG Inclusive Language Guide represents a meaningful step toward inclusive healthcare, primarily for our guidelines. In line with fraternity, it offers a replicable model for other organizations internationally, and contributes to the broader goal of equitable, person-centered care.

ID 1113- Transparency in Science Reporting: Bridging the Gap between Evidence and Patient Care

Joachim STURMBERG [(1)] , Thomas KÜHLEIN [(2)]

(1) University Of Newcastle, Newcastle, Australie
(2) Uniklinikum Erlangen, Erlangen, Allemagne

Context: General practitioners require research evidence that supports real-world, patient-centred decision-making. However, medical publications frequently prioritise statistical significance, surrogate endpoints, and relative rather than absolute risks, failing to communicate outcomes that are meaningful and relevant for individual patients.

Methods: A detailed review and critical analysis of reporting in randomised controlled trials, clinical guidelines, and medical publications revealed key limitations: large sample sizes are often used to demonstrate statistically significant but clinically marginal differences, while composite endpoints can obscure true relevance for patients. Based on these findings, a transparency framework was developed to ensure clear communication of study

outcomes – including patient context, absolute benefits and harms, and explicit reporting of uncertainties – to better inform clinicians and patients.

Originality: Our framework is distinct in treating transparent reporting as both a moral and operational necessity. Unlike existing standards, which focus on methodological rigour, our approach requires outcomes to be contextualised for clinicians and patients, with u

Lessons learned and future implication: Statistical significance of relative differences alone cannot guide care. Context and absolute benefit and harm data a required for shared clinical decision-making. Adopting the transparency framework ensures that evidence is communicated rigorously and a

Discussion: Bridging the gap between research and everyday care demands that researchers, editors and publishers embrace uncertainty and prioritise transparency. The framework offers actionable steps, though successful adoption will depend on broader cultural and institutional change.

Conclusion: Transparent reporting of research evidence is essential for ethical, well-informed patient care that honours our profession's first commitment – do no harm. Adoption of this framework can restore trust, improve clinical relevance, and advance informed, shared decision-making in clinical care.

ID 899- Developing evidence-based guidelines on minor ailments in the absence of evidence

Anne-Karien DE WAARD, Maureen VAN DEN DONK, Jako BURGERS

Dutch College Of General Practitioners (nhg), Utrecht, Pays-Bas

Context: Minor ailments are medical conditions that can be self-diagnosed and managed with limited support of a healthcare professional. Examples are blisters, hematomas, nose bleeding, stubbed toes, and insect bites. The xxx College of General Practitioners runs a large evidence-based guideline program, but minor ailments are not covered due to limited evidence. However, evidence-based recommendations on managing minor ailments in daily life can still be helpful.

Methods: We drafted a guide for developing recommendations based on an existing guide using the GRADE method. Compared to standard guideline development, the number of questions is limited. If no evidence is available, guiding principles in formulating recommendations are 'in dubio abstine' and watchful waiting. We composed a panel of six practicing general practitioners (GPs), two practice assistants, one patient representative, and one guideline methodologist. Blisters were selected as topic to test the acceptance and feasibility of the process.

Originality: Recommendations on minor ailments for patients are helpful to support self management and to reduce GP burden.

Lessons learned and future implication: The panel selected seven relevant questions on management and prevention of blisters, for example: should a blister be punctured, should it be covered with a plaster, does prevention of friction or wet feet and hands prevent blisters? The literature revie

Discussion: The limited evidence base raises questions about the strength of the recommendations. However, the reliance on guiding principles such as in dubio abstine and watchful waiting, and including a feedback round among medical specialists ensures that the recommendations are safe and broadly supported.

Conclusion: Dealing with the absence of evidence in developing recommendations for minor ailments is challenging but feasible following a structured process with a panel of experts with experience in general practice. Further research is needed to evaluate acceptance and use in practice.

Corresponding author: Anne-Karien De Waard, a.dewaard@nhg.org

ID 897- Enhancing accessibility of primary care guidelines: development of an artificial intelligence tool

Anne-Karien DE WAARD, Ton KUIJPERS, Bart VAN DEN HOOGENHOFF

Dutch College Of General Practitioners (nhg), Utrecht, Pays-Bas

Context: The guidelines of the xxx College of General Practitioners support general practitioners (GPs) in delivering evidence-based care in daily practice. However, the increasing volume and complexity of these guidelines pose challenges for timely and efficient information retrieval during consultations. To address this, we are developing a generative artificial intelligence (AI)-tool to search within the guidelines and provide relevant, context-driven answers, improving accessibility and usability of the guidelines.

Methods: We used retrieval-augmented generation (RAG), which first searches a curated knowledge base for guideline-relevant passages based on the user's query and then feeds those passages along with the query to a large language model that formulates a natural-language answer. To ensure responses were comprehensive, accurate and safe, we conducted multiple usability tests among GPs and incorporated their feedback to improve the answers.

Originality: Traditional search engines rely on exact keyword matches. Using an AI tool is an innovative way to allow GPs to search the guidelines using everyday clinical language and still retrieve relevant guideline content.

Lessons learned and future implication: In a short period of time, we were able to develop a functioning prototype of an AI tool to search within the xxx primary care guidelines. The tool provides suitable answers to daily clinical questions. The key challenges were: Optimizing the retrieval pi

Discussion: An important question is whether users are willing to use the tool in daily practice and whether it helps them to find what they need as quickly as possible, also compared to existing search facilities. A possible downside of using AI tools is the impact on planetary health.

Conclusion: We were able to develop a generative AI-tool to search the xxx primary care guidelines, which provides suitable answers to daily clinical questions. The use of this tool bridges the gap between guideline availability and practical application and aims to improve the accessibility and usability of the guidelines.

Health service utilisation

ID 1968- Beyond the emergency visit: understanding persistent emergency attendance by Australian adolescents through family, GP and emergency clinician perspectives

Lani MAIER, Helen PARRY, Christine BERRY

Women's And Children's Health Network, Adelaide, Australie

Context: Current care practices for adolescents with persistent patterns of frequent attendance to emergency departments (ED) focus on acute crisis and behaviour management. These adolescents are more likely to have certain sociodemographic and health characteristics including older age, child protection involvement, chronic mental health concerns, medical co-morbidities, and lack of General Practitioner (GP) continuity of care[1]. Exploration of the underlying reasons for long term use of emergency services by adolescents is needed. [1] Parry H, Roxburgh E, Maier L, Louise J, Hill M, Berry C. Frequent attendance to paediatric emergency departments: Steps towards prevention. Emergency Medicine Australasia (2025) 37, e70037

Objectives: This GP-led research seeks to: 1. Increase understanding of underlying reasons for adolescents persistent frequent ED attendance 2.

Explore perceptions from GPs, emergency clinicians, and parents/ guardians 3. Explore perceptions of the role health services including longitudinal GP care

Methods: In a prospective qualitative study, inductive content analysis was used to identify themes from interviews conducted on 12 GPs, 12 paediatric emergency clinicians, and 15 parents/ guardians of 8 adolescents aged 12-15 years who had attended a tertiary paediatric emergency department > 5 times per year in 2 consecutive years.

Results: There were common themes across all 3 interview groups. Primary and tertiary health services are siloed with poor communication and collaboration. Adolescents with complex needs require time to build trusted therapeutic relationships. Current models of care prioritise compliance and risk mitigation over the needs of adolescents.

Discussion: These findings support a broadening of the focus of health care for adolescents with persistent emergency service attendance. These include review of policies to reflect the needs of adolescents, communication systems, proactively connecting high risk children and adolescents with a GP they trust for relationship-based regular, planned care.

Conclusion: A targeted early intervention and prevention approach including connecting high risk children risk with relationship-based GP care is recommended. Improved communication, collaboration and policy development prioritising the needs of children and young people requires further exploration.

ID 1432- Emergency Service Hyperusers: Clinical Profile and Primary Care Utilization - Cross-Sectional Study

Rita CARVALHO [(1)] , Ana Raquel FERNANDES [(1)], Ana Carolina PEIXOTO [(1)], Álvaro VIEIRA [(2)], Manuela SANTOS [(1)], João ABREU [(1)], Sara DOMINGUES [(1)]

(1) Pró-Saúde Family Health Unit, Braga Local Health Unit, Braga, Portugal
(2) Amaresaúde Family Health Unit, Braga Local Health Unit, Braga, Portugal

Context: The increasing use of Emergency Services (ES) in XXX represents a challenge, as many cases could be managed in primary health care (PHC). ES overuse is concentrated among a minority of patients with higher clinical complexity, making it essential to understand their profile to guide effective interventions.

Objectives: To characterize adult ES hyperusers (≥5 visits) from XXX Hospital, enrolled in Family Health Units in the XXX region, and to analyze their PHC utilization.

Methods: Observational, cross-sectional, analytical study conducted in 2023, including 319 patients aged ≥18 years. Data were collected from XXX® and XXX® platforms, including sociodemographic, clinical, behavioral variables, and PHC utilization. Statistical analysis included descriptive statistics, non-parametric tests, Spearman correlations, and Poisson regression.

Results: Median ES visits per patient was 6; 70.2% were female, median age 55 years. Multimorbidity was highly prevalent (85.9%) - particularly cardiovascular, musculoskeletal and respiratory conditions. Polypharmacy affected 46.7%. In PHC, the median number of consultations was 5, indicating that many hyperusers also actively use primary care. Physical activity was associated with fewer urgent visits. Patients with neurological conditions had more health care contacts in both ES and PHC. Employed patients used the ES less and distance to ES/PHC did not influence visit frequency.

Discussion: Our results suggest that multimorbidity, particularly neurological disorders, may play a significant role in hyperuse, consistent with recent literature. Physical activity demonstrated a protective effect, highlighting the role of health behaviors in ES use. High PHC utilization indicates that these patients are not disconnected from the system but represent a group with high clinical complexity. The lower use of ES by

employed patients suggests a "healthy worker effect". Interestingly, distance to ES or PHC did not influence visit frequency, suggesting that in a context of well-distributed primary and emergency care services, geographic proximity is less relevant than clinical and behavioral factors.

Conclusion: Early identification of ED hyperusers, structured management of multimorbidity, and promotion of healthy lifestyles in PHC may reduce avoidable acute episodes and improve overall health care efficiency. Developing health policies that ensure appropriate follow-up of these patients in PHC is therefore essential.

ID 1186- Digital twins in healthcare: high users in primary care services - conceptualization and use case definition

Rui MALHA [1] , Federico GUEDE-FERNÁNDEZ [2], Anabela FONSECA-SILVA [3], Fausto SILVA [4], Joel RIBEIRO [3], Julian PERELMAN [5], Luís SILVA [6], Mariana DIAS [2], Marta MOREIRA MARQUES [5], Ana LONDRAL [2]

(1) Unidade Local De Saúde De Almada-Seixal, Seixal, Portugal
(2) Value For Health Colab, Lisboa, Portugal
(3) Glintt Life, Porto, Portugal
(4) Unidade Local De Saúde De Almada-Seixal, Almada, Portugal
(5) Nova National School Of Public Health, Lisboa, Portugal
(6) Nova School Of Science And Technology, Almada, Portugal

Context: Primary Care Services (PCS) are challenged by a small group of High Users (HU) who account for a disproportionate number of visits over multiple years. These patients often present with multimorbidity, socioeconomic vulnerability, and fragmented care, leading to poorer outcomes and increased system strain. Despite their importance, HU trajectories remain insufficiently understood, and available tools do not adequately support early identification or coordinated management. Digital Twin (DT) technology, defined as dynamic, AI-driven digital replicas of patients, offers an opportunity to address this gap in PCS.

Objectives: This work aims to conceptualize a DT solution to support HU management in PCS and to define a structured use case grounded in real-world needs. Specifically, we seek to (i) characterize HU challenges and trajectories, (ii) integrate stakeholder perspectives into DT design, and (iii) identify functionalities enabling clinical, organizational, and patient-level decision-making.

Methods: A Participatory Action Research (PAR) methodology was used, progressing through iterative cycles of planning, action/observation, and reflection. Data collection included semi-structured interviews, journey-mapping sessions, focus groups, impact-mapping exercises, and workshops. Participants included clinicians, patients, administrators, researchers, policymakers, and developers. Insights were prioritized using MoSCoW ranking and a Real-Time Delphi process to reach consensus on key DT features.

Results: Stakeholders identified recurrent HU patterns, including multimorbidity, unresolved care episodes, and organizational inefficiencies, along with gaps in coordination, risk prediction, and patient literacy support. Consensus emerged that a DT should integrate multimodal data, model HU risk trajectories, generate early warnings signals, support personalized care plans, and assist administrators in resource planning. The final use case specifies the primary actor (clinicians), the goal (early identification and proactive HU management), and a DT architecture composed of data-integration pipelines, predictive-modelling components, interface-design requirements, and continuous synchronization mechanisms.

Discussion: The PAR approach captured the multidimensional nature of HU and ensured that the DT concept addressed clinical, managerial, and patient priorities. Although implementation was beyond this phase, the co-designed use case is considered feasible for PCS.

Conclusion: A participatory DT design process can strengthen HU management by improving risk stratification, care coordination, and system efficiency. This framework can guide future development, testing, and policy integration in PCS.

Corresponding author: Rui Malha, rui.malha@gmail.com

ID 1075- Improving the Care of High Need/High Cost patients, A narrative review

Carmel MARTIN

Monash University, Clayton, Australie

Context: The phenomenon of High-Need/High-Cost (HNHC) patients—individuals with frequent, often avoidable hospital and emergency department use—has emerged globally as a critical policy concern. Despite two decades of interventions, these patients are still framed as undermining health system efficiency. This narrative review critically explores how HNHC has been constructed and operationalized in policy, research, and care delivery.

Objectives: This narrative review critically explores how HNHC has been constructed and operationalized in policy, research, and care delivery.

Methods: Using a multi-phase, constructivist methodology grounded in Critical Systems Heuristics (CSH), the study began with an inductive scan of key literature and international feedback from primary care researchers. Thematic analysis was built through iterative keyword refinement, snowball sampling, and conceptual coding. Only after coding saturation was achieved was the CSH lens applied to assess the assumptions, stakeholder perspectives, and systemic framings shaping the HNHC discourse.

Results: The results show that the rise of the Triple Aim paradigm—focusing on care quality, population health, and cost—has driven global interest in super-utilization. Labels such as “frequent flyer” or “high-utilizer” reduce complexity to econometric metrics, often ignoring the lived experience, structural inequities, and expected distribution patterns (e.g., 80:20 Pareto principle). Intervention studies—mostly care coordination or case management—were narrowly evaluated using utilization or cost outcomes. Equity, relational continuity, and social determinants of health were acknowledged but rarely integrated into program design or evaluation. More recent concepts like the Quintuple Aim include equity and workforce well-being, yet practical uptake remains limited.

Discussion: The research literature and evaluation tools heavily reflect systemic priorities rooted in cost containment. As a result, patient-centered and complexity-informed approaches remain peripheral. A shift is needed—from reactive, transactional care to proactive, anticipatory strategies that strengthen community resilience and empower high-need populations.

Conclusion: High-need patients should not be seen as system failures, but as individuals whose journeys can guide better care design. A complexity-informed, equity-oriented framework—grounded in the lived realities of patients, caregivers, and frontline providers—can support more responsive, sustainable, and just care models.

ID 514- Evaluation of Questionnaire-Based Triage for Online Urgent Appointment Requests in General Practice: Patient Satisfaction and Care Pathway Orientation

Nicolas DE CHANAUD, Roxane LIARD, Nathanaël BEEKER

Ipso Santé, Paris, France

Context: Originally developed in military settings to prioritise wounded individuals, triage has been adapted to primary care (e.g., the French Service d’Accès aux Soins and the UK “Total Triage” model) to optimise the management of requests before consultation. Although rarely implemented in French primary-care group practices, triage could improve patient flow in the context of high demand and workforce constraints.

Objectives: To assess satisfaction and utilisation patterns associated with a questionnaire-based triage tool used for online urgent consultation requests in general practice.

Methods: We conducted a prospective, quantitative, observational study among patients and general practitioners participating in a capitation-based payment programme. When booking an online appointment for an “urgent”

reason, patients could complete a triage questionnaire. The tool generated orientation recommendations: national health information sheets (Ameli), telephone advice within 48 hours from the patient's general practitioner, in-person or remote consultation, or urgent call to the national emergency number (15). Patient and clinician satisfaction was collected through structured questionnaires, and triage orientation data were extracted from the electronic medical record.

Results: Over 12 months, 898 orientations were generated: • 32 (4%) to information sheets • 597 (66%) to telephone advice • 252 (28%) to a consultation • 7 (1%) to the emergency number (15) Among those oriented to telephone advice: • 35% booked a consultation directly • 45% consulted within 48 hours and 8% within 7 days • 12% did not consult within 7 days Overall, 93% (57) of triage users rated the tool as highly satisfactory, and 67% (232) of general practitioners judged the orientations to be highly appropriate.

Discussion: The tool was well accepted by patients but generated more mixed perceptions among clinicians, largely due to the limited use of information sheets and the modest reduction in consultations. Although based on real-world data from an urban multicentre setting, generalisability remains limited. Extending triage to non-urgent requests and diversifying care pathways could enhance its operational value.

Conclusion: Questionnaire-based triage is feasible and well received by patients but offers limited impact on reducing consultations. Broader implementation strategies may be required to optimise demand management in general practice.

ID 505- Virtual Professional Consultation (VPC) in Singapore: A Regional Model for Strengthening Primary-Specialist Care Integration

Lynn LEE, Rachel YEONG, Christopher CHONG, Evelyn TAN, Angeline LIM, Foo DAVID

Nhg Health, Singapore, Singapour

Context: Singapore's NHG Health covers 1.5 million residents and ~600 GP clinics in the Central-North region. To reduce unnecessary referrals and enable patients to receive specialist-guided care faster, NHG Health implemented a two-tier VPC model across its three acute hospitals.

Methods: Tier 1 = general clinical queries without patient identifiers via instant messaging; Tier 2 = patient-identified e-consults with secure document exchange. The NHG Health VPC model aligns each hospital with its geographical catchment while allowing GPs to join any VPC group for convenience. Specialists in selected disciplines for GPs and polyclinics are reachable through WhatsApp Communities (GPs) or Microsoft Teams (polyclinics), chosen for existing workflow compatibility. Condition-specific pathways (Tele-ECG, Tele-AF, Tele-Ortho with upfront MRI, Mental Health VPC) are embedded. Onboarding, etiquette guides and dedicated relationship managers maintain engagement; clinical governance is preserved through audit logs and response-time targets.

Originality: Unlike single-platform e-consult pilots reported internationally, VPC is a decentralised, multi-platform, region-agnostic implementation operating within a national system. Integration of tiered communication and condition-specific tele-pathways in one fr

Lessons learned and future implication: Implementation revealed that managing multiple communication platforms creates significant administrative burden, prompting plans for a unified interface. Technical challenges around secure image sharing for dermatology consultations and cross-provider MR

Discussion: A flexible, regionally-adapted VPC model can strengthen primary-specialist integration without major capital investment. Success depends on aligning communication tools with existing clinician behaviour, ensuring governance, and embedding pathways for high-volume conditions.

Conclusion: NHG Health's VPC demonstrates rapid, scalable primary-specialist collaboration, offering a replicable template for healthcare systems seeking timely, cost-effective integration.

ID 2187- Prevalence of Psychoactive Substance Use Among General Practitioners in Occitanie, France: Implications for Physician Well-being and Patient Care

Yohann VERGÈS, Nicolas PHILBERT, Julie DUPOUY

Dumg Toulouse, Toulouse, France

Context: Understanding the patterns of psychoactive substance use among physicians may help supporting their well-being and maintaining high standards of patient care. Given the demanding nature of medical practice, GPs may face unique stressors that influence their substance use patterns.

Objectives: This study aimed to estimate the prevalence of psychoactive substance use (alcohol, tobacco, cannabis, benzodiazepines, cocaine, and opioid) among general practitioners (GPs) in the region and to identify sociodemographic and professional factors associated with these behaviors, including workload, age, and parental status.

Methods: A cross-sectional study was conducted using an anonymous online questionnaire distributed to GPs in XXX. The survey combined two recruitment strategies: a broad diffusion via social media and a randomized subsample GPs selected from a regional directory and contacted by phone. The questionnaire, hosted on the secure Skezia platform, included validated scales to assess substance use (AUDIT, Fagerström, CAST, ECAB) and sociodemographic and professional information, including age, gender, marital status, parental status, and weekly working hours. Anxiety levels were assessed using a self-reported question. Data were analyzed using Jamovi.

Results: The study included 190 GPs (44 residents, 146 practicing physicians), with a 15% response rate in the randomized subsample. Alcohol misuse was reported by 22.6% of participants, with 6.8% showing probable dependence. Tobacco use was 10.5%. Cannabis use in the past five years was 17.4%. Benzodiazepine use was 23.2%. Cocaine use was 9.5%. Opioid use was 2.6%. Anxiety was reported by 54.2% of participants. Risk factors included younger age, lack of children, and high workload. GPs working 50–60 hours/week reported more frequent alcohol consumption (31.8%).

Discussion: The prevalence of psychoactive substance use among GPs in Occitanie aligns closely with general population trends, except for lower tobacco use and higher benzodiazepine use. The high rates of anxiety (54.2%) and substance use underscore the need to address systemic and personal factors influencing physician well-being.

Conclusion: This study provides a regional snapshot of substance use patterns among GPs, highlighting the importance of further research to explore longitudinal trends and the effectiveness of interventions. By fostering a better understanding of these dynamics, the medical community can work toward improving physician health and, by extension, patient care.

ID 1963- Moderate-to-high fatigue severity as an independent correlate of muscle strength and endurance among hospital employees

Hsin-Hsuan CHUNG, Hung-Keng WU, Yi-Wen TSAI

Department Of Family Medicine, Chang Gung Memorial Hospital, Linkou, No.5, Fuxing St., Guishan Dist., Taoyuan City, 333, Taiwan, Taoyuan City, Taïwan, République de Chine

Context: Fatigue is highly prevalent among healthcare workers and is associated with impaired health, reduced productivity, and increased occupational risk. Fatigue assessment using standardized scales may provide a practical approach for identifying workers at risk of functional decline and guiding workplace health promotion strategies. However, its association with objectively measured physical fitness remains unclear in occupational healthcare settings.

Objectives: This study aimed to examine whether moderate-to-severe personal or work-related

fatigue, assessed using validated fatigue scales, is independently associated with physical fitness performance, such as muscle strength, muscle endurance, flexibility, cardiorespiratory fitness, and grip strength among hospital employees.

Methods: In this multicenter, cross-sectional study, personal and work-related fatigue were assessed using validated scales, and participants were categorized into mild or moderate-to-severe fatigue groups. Independent t-tests were conducted to compare demographic characteristics and physical fitness parameters between fatigue groups. Multivariate linear regression analyses were performed to examine associations between fatigue severity and physical fitness outcomes, particularly muscle strength and muscle endurance, adjusting for potential confounders.

Results: A total of 365 hospital employees were enrolled, with a mean age of approximately 45 years. Compared with employees reporting mild fatigue, those in the moderate-to-severe fatigue group were significantly younger (43.2 vs. 46.1 years, $p < 0.05$), exhibited poorer muscle strength and endurance as measured by sit-up normative scores (3.54 vs. 3.94, $p < 0.05$), and had lower overall physical fitness scores (11.8 vs. 12.7, $p < 0.05$). After multivariable adjustment, moderate-to-severe fatigue remained independently associated with lower muscle strength and endurance ($\beta = -0.10$; 95% CI: −0.19 to −0.01; $p = 0.026$). Compared with employees reporting mild fatigue, those with moderate-to-severe fatigue demonstrated an approximately 0.1-point reduction in muscle strength and endurance performance.

Discussion: Fatigue severity, assessed using standardized scales, was independently associated with poorer muscle strength and endurance, suggesting that fatigue may capture aspects of functional health status not fully reflected by traditional cardiometabolic or anthropometric indicators.

Conclusion: Fatigue assessment may serve as a scalable and actionable tool for healthcare employers to identify workers at risk of functional decline and to guide targeted workplace health promotion and fatigue management strategies. Keywords (MeSH Terms) Fatigue; Physical Fitness; Workplace Health Promotion

ID 1761- Burnout in physicians practicing telemedicine: a systematic review

Cristina SICORSCHI GUTU [(1)] , Lara MEIER [(2)], Cristina BRAVO ELVIRA [(3)]

(1) Medgate Ag, Eckental, Allemagne
(2) Klinik Arlesheim Ag, Arlesheim, Suisse
(3) Cambridge University Hospitals Nhs Foundation Trust, Cambridge, Royaume-Uni

Context: Burnout among physicians is an escalating concern in modern healthcare systems, marked by emotional exhaustion, depersonalization, and reduced personal accomplishment. The COVID-19 pandemic intensified workload and psychological strain, coinciding with a rapid global expansion of telemedicine. This digital shift sparked debate regarding its impact on physician well-being, yet only limited evidence has explored how telemedicine influences burnout. Given the already elevated prevalence of mental health issues among healthcare providers, understanding whether telemedicine alleviates or exacerbates burnout is essential.

Objectives: This systematic review aimed to examine the relationship between telemedicine use and burnout among physicians.

Methods: A comprehensive search was done in 4 databases: Pubmed,Scopus,Cochrane and PsycNet. We identified 469 records; after removing duplicates, 382 articles were screened, and 16 studies met inclusion criteria (14 cross-sectional, one mixed-methods, and one qualitative study).

Results: Findings were mixed: several studies reported that telemedicine improved work–life balance, flexibility, and autonomy, contributing to lower burnout levels, while others highlighted increased workload, technological challenges, and reduced professional fulfillment, suggesting a potential worsening of burnout.

Discussion: This review shows that telemedicine's impact on physician burnout is inconsistent. Some studies report benefits such as greater flexibility and improved work–life balance, which may reduce

burnout. Others describe increased administrative burden, technical challenges, and reduced patient connection, which may worsen stress. These mixed findings likely reflect differences in implementation, support, and specialty-specific needs. Overall, telemedicine's effect on burnout depends heavily on context.

Conclusion: Telemedicine can both alleviate and contribute to physician burnout. While it offers flexibility, it may also introduce new stressors. Current evidence is limited and inconsistent, highlighting the need for stronger, longitudinal research to determine how telemedicine can be integrated in ways that support physician well-being.

ID 1692- Economic burden of work-related mental health loss among physicians: QALY monetization using GHQ-12 mapping

Gemma SEDA-GOMBAU [(1)] , Brenda Biaani LEÓN-GÓMEZ [(2)], Candela SANCHO [(2)], Anna MITJANS-GARCÉS [(3)], Antoni CALVO [(3)], Adrià PRIOR-ROVIRA [(2)], Rosa Maria GARCIA-SIERRA [(2)], Maria VERDAGUER-MATA [(2)], Eduard MORENO-GABRIEL [(2)], Pere TORÁN-MONTSERRAT [(2)]

(1) Universitat Autònoma De Barcelona, Barcelona, Espagne
(2) Unitat De Suport A La Recerca (usr) Metropolitana Nord, Mataró, Espagne
(3) Col·legi Oficial De Metges De Barcelona, Barcelona, Espagne

Context: Mental health is a critical component of healthcare workforce sustainability. Physicians face unique stressors, high patient loads, long shifts, on-call duties, and administrative pressures, that increase vulnerability to anxiety, depression, and burnout. These conditions not only impair quality of life but also compromise patient safety, clinical decision-making, and organizational efficiency. The WHO estimates that poor mental health costs the global economy US$1 trillion annually in lost productivity, with healthcare professionals among the most affected groups. Despite this, few studies translate mental health deterioration into standardized economic metrics such as QALYs, limiting the ability to prioritize interventions and allocate resources effectively.

Objectives: To estimate the economic cost of mental health deterioration associated with work-related factors among physicians by mapping GHQ-12 scores to EQ-5D utilities and annual QALY losses using Mao's (2025) algorithm.

Methods: Cross-sectional study of 708 physicians in Barcelona. Psychological distress was measured with GHQ-12. EQ-5D utilities and annual QALY losses were derived using Mao (2025) mapping, which improves predictive accuracy for mental health states compared to earlier models. QALY losses were monetized using Spanish cost-effectiveness thresholds (€20,000–€34,000/QALY). We analyzed mean costs by work setting, on-call type, contract type, weekly hours, and sector. Correlations between GHQ-12, EQ-5D, and QALY loss were assessed.

Results: Mean EQ-5D was 0.89; mean annual QALY loss 0.11. Estimated annual mental-health cost per physician ranged from €2,200 to €3,700 depending on threshold. Higher costs were observed in primary care, ICU, emergency services, in-person on-call duties, and non-permanent contracts.

Discussion: Our findings underscore the critical importance of addressing mental health among healthcare professionals. Physicians are exposed to persistent psychosocial stressors, high patient loads, unpredictable schedules, and frequent on-call duties, that elevate the risk of anxiety, depression, and burnout. These conditions not only impair individual well-being but also compromise patient safety, clinical decision-making, and organizational performance.

Conclusion: Work-related mental health deterioration among physicians entails substantial QALY losses and economic costs. Incorporating QALY-based metrics into occupational health policy can guide resource allocation and improve workforce sustainability.

Corresponding author: Gemma Seda-Gombau, gemma.seda@uab.cat

ID 1670- Working Conditions and Mental Health Among Physicians in Catalonia

Gemma SEDA-GOMBAU [(1)] , Brenda Biaani LEÓN-GÓMEZ [(2)], Candela SANCHO [(2)], Juan José MONTERO-ALIA [(2)], Adrià PRIOR-ROVIRA [(2)], Anna MITJANS-GARCÉS [(3)], Antoni CALVO [(3)], Noemí LAMONJA-VICENTE [(2)], Guillem PERA [(2)], Pere TORÁN-MONTSERRAT [(2)]

(1) Universitat Autònoma De Barcelona, Barcelona, Espagne
(2) Unitat De Suport A La Recerca (usr) Metropolitana Nord, Mataró, Espagne
(3) Col·legi Oficial De Metges De Barcelona, Barcelona, Espagne

Context: Physicians' mental health is fundamental for high-quality care and patient safety. Recent systemic changes, including the COVID-19 pandemic, technological innovations, and demographic shifts such as feminization and migration, have intensified psychosocial stressors in clinical practice. These pressures intersect with structural determinants like employment sector, workload, and job multiplicity, creating complex vulnerabilities. Understanding these dynamics is essential for designing interventions that safeguard well-being and sustain healthcare systems.

Objectives: To analyze the relationship between physicians' mental health and working conditions, focusing on employment sector (public vs. private), number of jobs, and primary workplace setting, while considering demographic factors such as age and country of origin.

Methods: A cross-sectional study was conducted using data from the 2021 and 2022 Galatea Foundation Surveys. Mental health was assessed using the GHQ-12 screening tool. Descriptive statistics summarized sample characteristics; chi-square and Kruskal-Wallis tests explored bivariate associations. Logistic regression models, both crude and adjusted, estimated odds ratios for poor mental health across occupational and demographic factors, stratified by gender.

Results: Age ≥50 was consistently protective for both genders (OR=0.5, $p<0.05$). Being foreign-born increased risk among women (OR=1.7, $p<0.05$). For men, working in the public sector was associated with higher psychological distress (OR=2, $p<0.05$), while holding multiple jobs showed a protective effect (OR=0.5, $p<0.05$).

Discussion: Female physicians consistently reported worse mental health than men, yet none of the occupational factors analyzed, such as employment sector, number of jobs, or workplace setting, were significantly associated with their outcomes. This suggests that their higher psychological distress may be driven by structural and psychosocial determinants beyond traditional labor variables, such as unpaid domestic work and organizational dynamics. Conversely, among men, working in the public sector was linked to poorer mental health, while holding multiple jobs appeared protective. These findings highlight that occupational factors interact differently across genders and underscore the need for gender-sensitive and intersectional approaches in occupational health policies.

Conclusion: Safeguarding physicians' mental health requires systemic strategies beyond individual coping mechanisms. Policies should address structural inequalities, promote flexible and supportive work environments, and integrate psychosocial resources into healthcare organisations. Given the demographic evolution of the medical workforce, interventions must be gender-sensitive and culturally responsive.

Corresponding author: Gemma Seda-Gombau, gemma.seda@uab.cat

ID 1239- Stress factors affecting family physicians in urban primary care settings

Lia GULEDANI

Family Medicine Department, Tbilisi State Medical University, Tbilisi, Géorgie

Context: Family physicians carry much of the everyday load of primary care, often working under pressure that is rarely acknowledged.In urban clinics in XXX, this role is compounded by increasing administrative responsibilities, complex patient needs and limited resources. Persistent occupational stress combined with low salaries and limited institutional support reduces the appeal of the specialty for younger physicians, threatening the future availibility of family doctors.

Objectives: This study aimed to identify the main occupational stressors among family physicians in urban primary care settings in XXX and to examine their relationship with emotional exhaustion, job satisfaction and perceived impact on clinical performance.

Methods: A cross-sectional survey was conducted using Google Forms and distributed via email. The questionnaire included 33 quantitative and qualitative items exploring common stressors,their frequency and severity, consequences for daily practice and physician-suggested strategies for reducing workload-related strain.

Results: A total of 133 family physicians completed the survey. More than half (54.86%) reported daily work-related stress. Administrative tasks were the most frequently cited stressor (64.72%), while 22 respondents identified patient overload as a major contributor. Emotional exhaustion was prevalent, with 80% reporting significant end-of-day fatigue. The workforce was predominantly older: 33.36% were over 60, 34,51% were 50-60 and only 12.39% were early-career physicians.

Discussion: Administrative burden, more than clinical complexity, emerged as the principal stressor. Physicians reported that sustained pressure impaires concentration and may increase the likelihood of clinical errors,posing risks to patient safety. The age imbalance indicates a long-term workforce vulnerability. Ongoing stress and comparatively low salary may accelerate retirement among senior physicions and reduce interest in family medicine among younger professionals. Without structural interventions the specialty may face escalating shortages.

Conclusion: Addressing occupational stress requires system-level solutions, including enhanced administrative support,extended consultation times,streamlined documentation processes and fair compensation for high workload. Implementing these measures is essential to protect physician wellbeing,safeguard patient care and maintain a sustainable family medicine workforce.

ID 1099- Long COVID among healthcare professionals: health impact and implications for work performance

Sandra LEÓN-HERRERA [(1)] , Raquel GÓMEZ-BRAVO [(2)], Pia DELANO [(3)], Mireia UTZET [(3)], Sara ARES-BLANCO [(4)], Ileana GEFAELL LARRONDONDONDO [(4)], Mª Pilar RODRÍGUEZ-PÉREZ [(5)], María Pilar ASTIER-PEÑA [(6)]

(1) Department Of Psychology And Sociology, University Of Zaragoza, Zaragoza, Espagne
(2) Centre Hospitalier Neuropsychiatrique, Ettelbruck, Luxembourg
(3) Cisal-Centre For Research In Occupational Health, Barcelona, Luxembourg
(4) Federica Montseny Health Centre, Gerencia Asistencial Atención Primaria, Servicio Madrileño De Salud, Madrid, Espagne
(5) Department Of Physiotherapy, Occupational Therapy, Rehabilitation, And Physical Medicine At Rey Juan Carlos University, Madrid, Espagne
(6) Universitas Health Centre, Public Health Care Service Of Aragon, Zaragoza, Espagne

Context: Long COVID is characterised by persistent or recurrent symptoms following acute SARS-CoV-2 infection. Healthcare professionals—who experienced sustained exposure and high workloads during the pandemic—appear disproportionately affected. Persistent symptoms can compromise both their health and their ability to meet demanding clinical responsibilities, raising concerns about workforce well-being, retention, and safety.

Objectives: To examine the experience of healthcare workers living with Long COVID across Europe, with a focus on its impact on work capacity, workplace adaptations implemented, and strategies used to maintain professional performance.

Methods: We designed a mixed-methods study combining a structured online questionnaire with optional open-ended questions. Eligible participants include physicians, nurses, physiotherapists and other healthcare workers with confirmed or clinically suspected Long COVID. Data collection has recently begun and remains open. Quantitative data will be analysed using descriptive and comparative statistics. Qualitative responses will undergo thematic analysis to explore perceived limitations, support needs, and experiences with organisational responses. The study has received ethical approval from the Research Ethics Committee for Medicinal

Products (CEIm) of Hospital Universitario La Paz (PI-5030).

Results: Preliminary findings will be available by the time of the conference. Based on early responses, we anticipate identifying substantial variability in symptom burden, fluctuating functional limitations, and challenges in sustaining work performance. We also expect to document a wide range of workplace accommodations, differing levels of institutional support, and strategies employed by affected professionals to cope with physical, cognitive and emotional difficulties.

Discussion: Understanding how Long COVID affects healthcare personnel at both personal and organisational levels is essential to inform workforce planning and occupational health policies. The mixed-methods approach is expected to provide complementary insights: quantitative patterns of impact and qualitative narratives that contextualise workers' lived experiences.

Conclusion: This study aims to generate evidence to guide the development of supportive institutional policies, tailored return-to-work pathways, and workplace adaptations for healthcare professionals experiencing Long COVID.

ID 686- Trends in quality of Cardiovascular disease management in primary care in Georgia

Tamar GABUNIA, Irine KAROSANIDZE, Ushangi KILADZE

National Family Medicine Training Center, Tbilisi, Géorgie

Context: Strengthening the quality of care for hypertension, cardiovascular disease (CVD), and type 2 diabetes is a strategic priority for primary care. To guide continuous quality improvement and support national PHC reforms, a multi-year clinical audit at the National Family Medicine Training Center in Georgia (Serving 29000 population) evaluated trends in service quality between 2019 and 2023.

Methods: A structured clinical audit reviewed 648 records from routine primary care visits in 2023 and compared them with assessments conducted in 2019. Indicators reflected core process and outcome measures, including diagnostic testing, cardiovascular risk assessment, and adherence to evidence-based treatment.

Originality: This longitudinal audit provides one of the few multi-year insights into PHC performance for NCD management in Georgia. Unlike one-off assessments, it captures the influence of new protocols, revitalised preventive services in the post-pandemic period, an

Lessons learned and future implication: Between 2019 and 2023, smoking status documentation rose from 61% to 86%. Fasting glucose testing increased, from 27.7% to 77.6% in the general population, while cholesterol testing rose from 18.5% to 85.7%, and LDL testing from 3.6% to 39.4%. BMI recordi

Discussion: Improved measurement, preventive activities, and evidence-based prescribing demonstrate meaningful progress in primary care quality. However, weaker performance in BP control, limited complication screening, and variation among teams highlight areas requiring systemic strengthening, workflow redesign, and targeted training.

Conclusion: Quality of NCD management in primary care improved substantially between 2019 and 2023. Further progress will depend on standardizing practice across teams, integrating systematic complication screening, and enhancing risk-based management.

Corresponding author: Irine Karosanidze, nfmtc@nilc.org.ge

ID 649- Optimization of peripheral arterial disease treatment: a continuous quality assurance and improvement project in a family health unit

Vitória CRUZ, Bárbara ALVARENGA, Maria João SÁ, Mário José GOMES

Usf Faria Guimarães, Porto, Portugal

Context: Atherosclerotic peripheral arterial disease (PAD) of the lower limbs is a prevalent condition and a strong marker of cardiovascular risk, affecting an estimated 236 million people worldwide. Cardiovascular mortality ranges from 9% in asymptomatic to 13% in symptomatic patients. The European Society of Cardiology (ESC) recommends LDL-C < 55 mg/dL with >50% reduction from baseline, alongside appropriate antiplatelet or dual antithrombotic therapy.

Objectives: To optimize lipid-lowering and antithrombotic therapy in lower-limb PAD according to the 2024 ESC guidelines, and to improve clinical record quality by correcting PAD (ICPC2-K92) miscoding and reinforcing diagnostic and therapeutic review within the medical team.

Methods: A retrospective quality-improvement study was conducted over six months, including patients with atherosclerotic lower-limb PAD and LDL-C > 55 mg/dL and/or non-compliant antithrombotic therapy according to ESC 2024 guidelines. A clinical meeting was held to review cases and implement corrective strategies. Target achievement rates were classified as ≥50% (desirable) and ≥70% (excellent).

Results: A total of 231 patients coded with K92 (ICPC2 - Atherosclerosis/Peripheral Arterial Disease) were analysed. After applying exclusion criteria, 137 records were removed, resulting in a final sample of 94 patients. Seventy patients (74.5%) were identified as eligible, either because they had not achieved LDL-C targets, were not receiving appropriate antithrombotic therapy, or both. After the improvement cycle, 37 patients (52.9%) met the therapeutic goals. Of the remaining patients, 13 (18.6%) did not respond to the recall, and 20 (28.6%) did not reach the targets.

Discussion: The improvement cycle revealed ongoing challenges in PAD management, notably in accurate clinical coding and adherence to guideline-recommended therapy. Suboptimal LDL-C control was often associated with socioeconomic barriers, limited health literacy, and competing priorities in primary care. These results highlight the need for sustained, systematic approaches to ensure consistent, evidence-based management of PAD.

Conclusion: This project underscores the importance of optimizing pharmacological treatment in lower-limb PAD, a highly prevalent condition with very high cardiovascular risk. While achieving a desirable improvement, according to predefined criteria, the fact that 47.1% of patients remained outside therapeutic targets demonstrates the need for strengthened intervention strategies and closer follow-up.

ID 527- Primary Care Healthcare Professionals' Knowledge and Learning Needs for Abdominal Aortic Aneurysm Screening: A Mixed-Methods Analysis from Rural England

Lisa HAITH, Carl DEANEY

Marsh Medical Practice, North Somercotes, Royaume-Uni

Context: Abdominal Aortic Aneurysm (AAA) screening is a nationally implemented programme in England aimed at reducing aneurysm-related mortality through early detection. Primary care plays a crucial role in promoting screening, clarifying eligibility, and supporting patient engagement. Little is known about healthcare professionals' (HCPs) understanding, confidence, and learning needs relating to the AAA screening pathway.

Objectives: To assess primary care HCPs' awareness of AAA screening, explore perceived barriers within practice systems, evaluate confidence in supporting patients, and identify key educational needs to strengthen primary care involvement.

Methods: A mixed-methods questionnaire was distributed electronically to primary care professionals in a rural setting. Quantitative items assessed familiarity, role clarity, system reliability, and confidence, while qualitative free-text responses underwent inductive thematic analysis.

Data were integrated to produce a comprehensive analysis of learning needs and perceived barriers.

Results: Nineteen HCPs participated. Awareness of the national screening programme was low: 87% reported being only vaguely familiar or not familiar at all, and none were "very familiar". Misconceptions were evident: 36% believed that women aged 65 receive routine invitations. Confidence was limited; 92% were unclear about the pathway for men over 65 who missed screening, and 100% lacked clarity regarding their follow-up responsibilities. Over half were not confident or unsure in arranging screening requests. Systems for identifying eligible men were inconsistent, with 69% uncertain whether their practice's recall processes were reliable. Key barriers included lack of system prompts (82%), limited pathway awareness (73%), time pressures (64%), and unclear responsibility between primary care and the screening programme (55%). Educational needs were substantial: 91% reported high or very high need for further training. Priority topics included eligibility and national guidance (91%), explaining screening to patients (82%), risk factors (64%), local pathways (64%), and surveillance intervals (55%). Preferred formats included face-to-face teaching (36%), webinars (27%), and written guides (18%).

Discussion: Findings reveal significant gaps in HCP familiarity, confidence, and clarity regarding AAA screening, as well as substantial system-level barriers. Enhanced training and improved digital prompts could strengthen primary care engagement.

Conclusion: Education, clarification of pathways, optimisation of digital systems, and integration of screening prompts could substantially improve HCP confidence and support patient uptake of AAA screening.

Corresponding author: Lisa Haith, lisa.haith@nhs.net

ID 525- Understanding Barriers and Drivers for Attending Abdominal Aortic Aneurysm Screening in Rural Primary Care based on patients' experiences

Lisa HAITH, Carl DEANEY

Marsh Medical Practice, North Somercotes, Royaume-Uni

Context: Abdominal Aortic Aneurysm (AAA) screening is an established national programme in England aimed at reducing aneurysm-related mortality through early detection. However, uptake varies substantially and is affected by awareness, accessibility, and understanding of the screening process. Primary care plays a central role in supporting engagement, yet patient perspectives remain underexplored.

Objectives: To assess patient awareness, understanding, motivations, barriers, and willingness to attend AAA screening, and to identify opportunities for improvement in primary care-led promotion and support of screening attendance.

Methods: A mixed-methods questionnaire was distributed electronically to adults within a rural primary care population. Quantitative data were analysed descriptively, and free-text responses were analysed thematically using an inductive approach. Responses were integrated to produce a comprehensive assessment of patient experience, perceptions, and screening intentions.

Results: Of 514 respondents, 94.4% consented to participate. Most were aged 65–74 (60%) or over 75 (33%), with an even gender distribution. Awareness was low: 68% reported never having heard of AAA screening, and only 18.5% recalled receiving an invitation. Knowledge gaps were substantial: 62% did not know screening is routinely offered to men aged 65, and 74% were unaware that men over 65 may self-refer. Despite this, willingness to attend was high, with 86.6% reporting they would be "very likely" or "likely" to attend. Key motivators included identifying problems early (83%), looking after personal health (76%), clear information (62%), and local venues (70%). Primary barriers were logistical: distance to the clinic (51%), transport difficulties (20%), late appointment letters (34%), and limited appointment flexibility (23%). Qualitative data reinforced themes of poor awareness, confusion around eligibility, transport difficulties, and "fear of the unknown". Prior attenders reported universally positive experiences.

Discussion: Findings indicate that low awareness rather than reluctance is the predominant barrier to

uptake. Accessibility and communication gaps further limit engagement. Primary care is well-positioned to address these shortcomings through personalised invitations, SMS reminders, local delivery models, and clear, consistent patient education.

Conclusion: Enhancing communication, improving local access, clarifying eligibility, and using multimodal reminders could significantly improve AAA screening attendance and reduce preventable morbidity and mortality in primary care populations.

ID 329- High Body Weight Variability and Risk of Cardiovascular Outcomes in Korean Adults Aged 75 Years and Older: a Nationwide Cohort Study

Seonmee KIM [(1)] , Youngjae KIM [(2)]

(1) Korea University Guro Hospital, Seoul, Corée, République de
(2) Kyobo Life Healthcare Center, Seoul, Corée, République de

Context: We investigate the impact of weight variability on the cardiovascular disease (CVD) outcomes among elderly individuals aged 75 years and older in Korea, utilizing the National Health Insurance Service (NHIS) Big Data

Objectives: Body weight variability (BWV) has emerged as an important marker of adverse clinical outcomes, yet most prior studies have focused on middle-aged adults or the general elderly population. Given the substantial cardiovascular burden in adults aged 75 years or older, we aimed to evaluate the association between BWV and cardiovascular outcomes in this age group.

Methods: We used a database of the Korean National Health Insurance system, and a total of 432,904 older adults aged 75 years or older who underwent health check-ups between 2012 and 2015 were included. BWV was defined as variability independent of the mean with the body weight measured at the check-ups. The study outcome was major adverse cardiovascular events (MACE), including myocardial infarction (MI), stroke, and cardiovascular (CV) mortality. We used Cox regression models to estimate the effect of BWV on MACEs.

Results: The individuals were followed for an average of 6.79 ± 2.42 years, during which 76,678 MACEs were occurred among the 432,904 individuals. Compared to individuals within the lowest quartile (Q1) of BWV, those with the highest quartile (Q4) was associated with an increased risk of MACEs (hazard ratio, HR 1.26, 95% confidence interval, CI 1.24–1.29), MI (HR 1.19, 95% CI 1.15–1.24), stroke (HR 1.16, 95% CI 1.13–1.19), and CV mortality (HR 1.51, 95% CI 1.51–1.57). These results remained consistent after adjusting for baseline body weight as a confounding variable.

Discussion: Globally, the elderly population is increasing, with a particularly sharp rise in the oldest-old population. We can observe that in this demographic, similar to other age groups, greater weight variability is associated with an increased prevalence and mortality from cardiovascular diseases.

Conclusion: Higher BWV was significantly associated with an increased risk of MACEs among adults aged 75 years or older, independent of baseline body weight. These findings highlight the importance of maintaining weight stability as a potential strategy to reduce cardiovascular risk in the oldest-old population

Corresponding author: Seonmee Kim, ksmpdh@korea.ac.kr

ID 314- The Silent Stroke Signals: A Missed Opportunity in General Practice?

Jean-François MICHEL, Sven URBANO

University Of Luxembourg, Luxembourg, Luxembourg

Context: Stroke remains a leading cause of mortality and long-term disability worldwide. Most strokes are linked to modifiable cardiovascular risk factors and early prodromal or warning symptoms frequently go unrecognized leading to missed

opportunities for prevention and timely intervention in general practice.

Objectives: The primary objective of this study was to assess the presence of potential warning signs occurring within the four weeks preceding an ischaemic stroke. A secondary objective was to analyse the management of major cardiovascular risk factors (hypertension, diabetes, smoking and dyslipidaemia) by general practitioners during the twelve months before stroke onset.

Methods: This quantitative, observational, non-interventional, single-centre study was conducted in XXX over a six months period. Inclusion criteria comprised age of 18 years or older, a confirmed diagnosis of ischaemic stroke and at least one consultation with a general practitioner within the previous year. Patients were recruited in the Neurovascular Unit of the XXX Hospital. Data were collected during structured patient interviews and from electronic medical records.

Results: Ten participants were included (mean age: 66 years; 70% men) of whom nine reported at least one neurological or non-neurological warning symptom within the four weeks preceding stroke onset. No significant increase in consultation frequency with general practitioners was identified. All patients presented at least two modifiable cardiovascular risk factors: smoking (6 out of 10 participants) hypertension (5/10), dyslipidaemia (5/10), and diabetes or prediabetes (4/10). Lifestyle factors were also prevalent, including low physical activity (7/10), alcohol consumption (5/10), and psychosocial stress (6/10). Overall, management of cardiovascular risk factors appeared suboptimal.

Discussion: These findings suggest that many strokes may be preceded by subtle prodromal symptoms that are often overlooked. Enhanced awareness among general practitioners and patients could improve early recognition and risk factor control.

Conclusion: This study, the first of its kind, demonstrates that ischaemic stroke may not be as sudden as previously thought. The early recognition of these subtle warning signs by general practitioners, combined with improved management of risk factors, could enhance stroke prevention efforts.

Hidden in plain sight: the GP's impact on health systems

ID 1797- Comparison of Disease Characteristics of General Practice Outpatients Between Tertiary Hospitals and Community Health Service Centers in Beijing, China

Yanli LIU [(1)] , Ma LI [(2)], Ma ZIYI [(3)]

(1) Department Of General Practice, Beijing Tiantan Hospital, Beijing, Chine
(2) Department of General Practice, Beijing Tiantan Hospital, Beijing, Chine
(3) Department Of General Practice, Shunyi Urban Area Community Health Service Center, Beijing, Chine

Context: Since 2018, to strengthen general practitioner training and promote two-way referral, general hospitals have begun to establish departments of general practice. On this basis, the rational division of labor between tertiary hospitals and community health service centers is key to optimizing medical resources, yet systematic comparison of their general practice outpatients' disease characteristics is lacking.

Objectives: To compare these characteristics and inform inter-institutional cooperation and differentiated general practice development.

Methods: Retrospective analysis of 2022–2023 outpatient data (gender, age, diseases) from a Beijing tertiary hospital (A) and a community health service center (B). Chi-square test was used to compare the difference between A and B in disease characteristics.

Results: A total of 79,889 and 91,800 visits were recorded in A and B, respectively. Chi-square test showed significant gender (44% vs 47.8% males; $p<0.001$) and age differences (predominant age: 40–59 years in A [39.14%] vs 60–79 years in B [55.74%]; $p<0.001$). Stratified analysis of 5 common diseases revealed no gender difference in hypertension. Females with hyperlipidemia/upper respiratory tract infection preferred A, while males with diabetes/coronary heart disease (CHD) preferred B (all $p<0.001$). Age differences existed in all 5

diseases: 60–79-year-olds with hypertension/hyperlipidemia/diabetes preferred B vs <60 preferred A; 60–79-year-old CHD patients preferred A vs <60 preferred B; respiratory tract infection patients aged ≤19/≥60 preferred B vs 20–59 preferred A (all p<0.001).

Discussion: The significant gender and age differences in general practice outpatient visits between tertiary hospitals (Institution A) and community health service centers (Institution B) reflect the inherent connection between institutional functional positioning and population health needs. In terms of age distribution, the predominance of 60–79-year-old outpatients in Institution B is consistent with the core function of community health service centers in chronic disease management and elderly health care. In contrast, Institution A may be related to the middle-aged population's higher demand for accurate diagnosis and standardized treatment of potential chronic diseases or early-stage complex symptoms.

Conclusion: General practice outpatients in both institutions are mainly chronic disease patients but with gender and age differences. Tailored service models should be explored to achieve differentiated development and strengthen inter-institutional connection.

ID 1610- Finding the family doctor - Bridging the "identity gap" in Taiwan's family physician system using the theory of planned behavior approach

Chyi Feng JAN

National Taiwan University Hospital, Taipei, Taïwan, République de Chine

Context: Taiwan's National Health Insurance achieves high accessibility but faces challenges in establishing continuity of care. Despite government initiatives like the "Family Practice Integrated Care Project (FPICP)", a significant portion of the population still lacks a fixed family doctor.

Objectives: This study utilized the Theory of Planned Behavior to investigate the public's understanding of family physicians, focusing on cognition, attitudes, subjective norms, and behavioral barriers.

Methods: The study was conducted in two phases. Phase 1 involved a cross-sectional survey of 507 citizens to delineate the determinants of having a family doctor. Phase 2 was a quasi-experimental intervention study (N=96) with or without involving help seeking family doctor via 5 health education animation youtube video.

Results: Phase 1 revealed that the primary barriers without their own family doctor were an "Information Gap"—70% were unaware of the government project—and a "Convenience Myth," where non-users significantly underestimated the efficiency of having a fixed health care provider (p<0.0001). Phase 2 results showed that the intervention significantly improved cognition (p<0.0001) and behavioral intention (p=0.003). However, a "Time Lag" in identity formation was observed; despite high satisfaction (71.4%), the self-perceived status of "having a family doctor" did not immediately change.

Discussion: The barrier to continuity of care in Taiwan is cognitive and behavioral. First is the "Information Gap", 70% without a family doctor, were completely unaware that the government even has a FPICP. Second is the "Convenience Myth". Citizens without a family doctor significantly believe that finding a fixed doctor is inconvenient (p<0.0001). Essentially, non-users are deterred by a 'perceived cost' of time that does not actually exist. Based on these findings, we propose three policy shifts for Taiwan: Digital Wayfinding: We need an official 'Family Doctor Map' App showing specific 'Family Doctor' tags. Rituals of Registration: We suggest a system where patients sign a 'Care Agreement' via an app. Family-Centric Marketing: We need to start marketing to households—such as "Every family, a family doctor".

Conclusion: Future policies for finding a family doctor must shift from passive enrollment to active "relationship management" utilizing tools like Digital Wayfinding (apps), Rituals of Registration (formal care agreements), and Family-Centric Marketing to solidify the patient-physician bond.

ID 1540- Sustained long-term benefits of structured primary care for patients with coronary artery disease: a 12-year cohort study in Germany (2010-2022)

Catriona FRIEDMACHER [(1)] , Kateryna KARIMOVA [(1)], Justyna WUENSTEL [(1)], Anastasiya GLUSHAN [(1)], Dorothea LEMKE [(2)], Claudia WITTE [(2)], Renate KLAAßEN-MIELKE2 [(3)]

(1) Insitute For General Practice, Goethe University, Frankfurt Am Main, Allemagne
(2) Aqua Insitut, Göttingen, Allemagne
(3) Amib, Ruhr University, Bochum, Allemagne

Context: In 2022, cardiovascular diseases (CVD) accounted for 32.7% of all deaths in the EU, with associated costs of €282 billion annually. In Germany, coronary heart disease (CHD) remains the leading cause of mortality and reported reductions in life expectancy gains over the last decade have been attributed to excess CVD mortality. In addition, high rates of avoidable hospital admissions suggest shortcomings in ambulatory and preventative care. In 2004, Germany introduced the general practitioner-centred care (GPCC) programme with the aim of delivering structured, coordinated and strengthened primary care.

Objectives: This study describes the long-term effects of the GPCC programme on healthcare utilization and all-cause mortality for patients with CHD over a 12-year observation period (2011–22).

Methods: A longitudinal, observational cohort study was conducted based on German health insurance claims data, covering 2011–22. Patients with CHD at the beginning of the observation period were included. Multivariate models were calculated, adjusting for key confounders to reduce selection bias, comparing usual care with GPCC.

Results: In 2011, 125,758 patients with CHD were enrolled; increasing to 169,101 patients in 2022. Over the 12-year observation period, GPCC participants had consistently lower rates of all-cause hospitalisation (OR 0.988, 95%CI, p<0.001), hospitalisation due to CVD (OR 0.989, 95% CI, p<0,001) and ambulatory care sensitive condition hospitalisation (OR 0.989, 95% CI, p<0,001) in comparison to usual care. Statin prescription rates were lower in the GPCC group at the start of the study but increased over the 12-year period, showing significantly higher rates (OR 1.003, 95%CI, p<0.0046) at the end of the study. All-cause mortality reduced over the 12-year period and was significantly lower in the GPCC group at the end of the study period (OR 0.987, 95% CI, p<0.001).

Discussion: Participation in structured and coordinated primary care programmes results in reduced health care utilisation and all-cause mortality in patients with CHD, offering sustained benefits for these patients over a 12-year period.

Conclusion: Given the high prevalence of CVD in Europe and associated costs, these findings emphasise the role of structured, coordinated primary care in strengthening care for patients with CVD and support the broader implementation of GPCC models.

ID 1482- Medical practice of General Practitioners in Nouvelle-Aquitaine (France)

Marina FERNANDES, Coralie BUREAU-YNIESTA

Dumg Limoges, Limoges, France

Context: Although there are as many general practitioners (GPs) as ways of practicing general medicine, comprehensive data on GP practice are lacking. To date, no descriptive scientific study of general practice has been conducted.

Objectives: The main objective was to describe the medical practice of GPs in XXX according to five dimensions: practice mode, GP office, office organization, schedule organization and patient panel management. This is an ancillary study investigating the description and influence of educational and professional pathways – according to their temporality of completion and typology – on medical practice.

Methods: We conducted a regional, cross-sectional, descriptive and observational study, using a mixed-methods design (quantitative: Excel® ; qualitative analysis: data standardization, thematic analysis of free-text responses). A self-administered questionnaire, distributed over three months to GPs, explored their professional activity.

Results: GPs had practised for an average of 16.2 years, under Sector 1 contracts, without additional fees, and were fully established in group practices. Their main supplementary activity was supervising medical trainees. Hospital-based work most frequently involved emergency medicine. Hypnosis predominated in alternative medicine, while medical regulation was the main activity in other modes of practice. Professional practice remained uncoordinated, included home visits, care in long-term care facilities, out-of-hours duties, technical procedures and tele-expertise. GP offices were located on average 10.45 km from the GP's residence, in urban areas, most often in health centres, without background music in waiting rooms. Office organisation included a physical secretary, and GPs were replaced during leave. GPs worked an average of 8,1 half-days per week, combining scheduled appointments with urgent-care sessions. Consultations lasted 16–20 minutes. GPs followed between 1001 and 1500 patients, while continuing to accept new ones. Patient panels, primarily composed of adult and elderly patients, were perceived as similar to the GP.

Discussion: Strengths of this study include originality, a comprehensive questionnaire, high participation, multi-level analysis and external validity. Limitations involve potential recall bias and geographic constraints.

Conclusion: This research provides a unique and enriched model of general practice. Future perspectives include interregional and national extension, relevant for defining GP practice in XXX, updating professional standards and refining data in the Medical Demography Atlas.

ID 1093- The diversity of General Practice: How many different health problems do GPs see?

Marianne HEINS, Joost VANHOMMERIG, Karin HEK, Bart KNOTTNERUS

Nivel, Utrecht, Pays-Bas

Context: General practice is the cornerstone of healthcare in many countries, providing comprehensive and continuous care for people with a wide range of health problems. Understanding the diversity of health problems managed in general practice is crucial for maintaining the broad expertise that defines general practice.

Objectives: To quantify the diversity and frequency of health problems managed in Dutch general practice

Methods: We analysed 2024 data from the Nivel Primary Care Database, comprising data on patient contacts and health problems from 426 GP practices and 1,921,614 registered patients. Health problems were classified using the International Classification of Primary Care (ICPC-1). We calculated how many different health problems were registered by an average GP practice (2.095 patients) on a weekly basis. Besides, we calculated whether health problems were registered weekly, monthly, or less than monthly, and what proportion of all patient contacts each group of problems represented.

Results: An average Dutch GP practice has 175 patient contacts per week, in which they see 157 different patients and manage 123 different health problems. Of the 653 ICPC-1 codes, 55 problems are registered weekly, 162 monthly, and 464 less than monthly. The 55 frequent problems account for 50% of all patient contacts, whereas the 464 infrequent problems account for only 14%. The most frequent health problems were cystitis, hypertension, cough, diabetes and fatigue.

Discussion: Our findings highlight that a limited set of health problems dominate daily practice. These frequent problems may be candidates for further task delegation within or outside the GP practice. In the Netherlands, Care for CVRM and diabetes have already (partially) been delegated to a practice nurse, but this could be organised on a regional level.

Conclusion: Dutch GPs see a wide variety of health problems. Although a limited set of health problems

dominate daily practice, GPs also need to be prepared for a large number of infrequent health problems.

ID 343- 8 Reasons Why Family Physicians are the Actual Stars of Medicine

Florian STIGLER

Golden Nuggets, Stockerau, Autriche

Context: Despite often lacking the prestige and remuneration of hospital-based sub-specialties, family medicine is hypothesized to be the critical driver of overall health system performance.

Objectives: This review had the objective to empirically evaluate the assertion that General Practitioners (GPs) are the "actual stars of medicine" by synthesizing evidence on their impact on population health, equity, and health economy.

Methods: A pragmatic literature review of relevant peer-reviewed publications on primary care effectiveness was performed across several databases. The review focused on identifying key associations between primary care strength and outcomes such as mortality rates, healthcare costs, continuity of care, and disease management efficiency.

Results: The synthesis identifies eight distinct evidence-based mechanisms, here summarized within five topics, demonstrating the superior value of primary care: 1) System Effectiveness: Countries with strong primary care orientations consistently exhibit lower health inequalities and reduced premature mortality. 2) Mortality Reduction: Increased GP density correlates directly with higher life expectancy; US-based data indicates that adding one GP per 10,000 inhabitants is associated with significant reductions in deaths and hospitalizations. 3) Continuity of Care: Long-term GP-patient relationships show a dose-dependent benefit; relationships spanning 15+ years are associated with a 28% decrease in acute hospital admissions and a 25% reduction in mortality risk. 4) Prevention and Cost: Primary care-centric systems demonstrate superior chronic disease management and higher delivery of preventive services (e.g., higher vaccination rates) while simultaneously reducing overall healthcare spending by avoiding unnecessary specialist interventions. 5) Health Equity: Stronger primary care orientation and higher GP densities are associated with lower health disparities.

Discussion: The evidence unequivocally positions family physicians as the backbone of effective healthcare systems. By prioritizing prevention, ensuring continuity, and mitigating social determinants of health, GPs deliver superior outcomes at lower costs compared to specialist-centric models.

Conclusion: These findings reinforce that shifting political and educational focus to primary care is the most effective, evidence-based strategy for securing a sustainable and healthy future.

ID 176- Developing a sentinel network for illicit substance use monitoring in Spain: a qualitative approach to key determinants

Sara ESTEVES ARAÚJO CORREIA [(1)] , Leonor VARELA-LEMA [(2)], Carla GUERRA-TORT [(2)], Ana TEIJEIRO [(2)], Linda B. COTTLER [(3)], Jasjit S. AHLUWALIA [(4)], Mónica PERÉZ-RÍOS [(2)]

(1) Universidade De Santiago De Compostela, Vigo, Espagne
(2) Universidade De Santiago De Compostela, Santiago De Compostela, Espagne
(3) University Of Florida, Gainesville, États-Unis
(4) Brown University School Of Public Health, Providence, États-Unis

Context: The emergence of new psychoactive substances and shifting patterns of illicit drug use pose increasing challenges for public health and for family medicine, which often serves as the first point of contact for affected individuals. Traditional epidemiological surveillance systems frequently experience delays in detection and response. Several countries have developed sentinel networks to enable earlier monitoring, using models based on hospital emergency departments, community

pharmacies, or even drug users themselves. Spain currently lacks a sentinel system tailored to its healthcare and social context.

Objectives: To identify the key elements required for the design and implementation of a sentinel network for the surveillance of illicit drug use in Spain, drawing specifically on the perspectives of key informants.

Methods: A qualitative study was conducted using focus groups with key informants from sectors involved in the detection, care, and analysis of substance use: hospital emergency professionals, family physicians, toxicologists, community pharmacists, harm-reduction workers, and epidemiologists.

Results: Participants identified common challenges: lack of standardised data collection, high clinical workload, concerns regarding the reliability of information obtained from drug users, and limited feedback mechanisms for participating professionals. They highlighted the need for a flexible model that integrates clinical detection, community-level information, and real-time epidemiological analysis. Key components identified included more training in toxicology and digital tools, the incorporation of primary care as a central node, and incentives or feedback systems to maintain professional engagement.

Discussion: Findings indicate that developing an effective sentinel network requires strong intersectoral coordination. The perspectives of family physicians underscore their strategic position for early detection and the need for improved tools and communication channels. Integrating clinical and community information streams would enhance the system's responsiveness.

Conclusion: A sentinel network tailored to the Spanish context should be multidisciplinary, flexible, and supported by adequate training and digital tools. Primary care should play a central role, given its proximity to patients and its capacity for early identification of emerging consumption patterns.

Homecare

ID 2246- Evaluation of the functionality and loneliness levels to the needs and experiences of the population over 80 years of age who are registered to the homecare list of a primary care outpatient clinic

Pemra CÖBEK UNALAN, Eşmi TOSLAK, Buğu USANMA KOBAN

Marmara University School Of Medicine Department Of Family Medicine, İstanbul, Türkiye

Context: Physical and social changes that occur through aging affect the quality of life of elderly individuals and lead to limitations in their daily activities. With the growing elderly population, it is essential to diversify and enhance the healthcare services offered to this group. Home visits are an important practice to meet the health needs of older people, improve health and reduce demand on the health system.

Objectives: To assess the needs of individuals aged 80 years and over for home visits, the rates of utilization of these services and the implementation status of the services.

Methods: The study was conducted with a cross-sectional design on a sample of individuals aged 80 and over residing in a district of Istanbul. Demographic information, health status, home visit experiences, and dependency levels of the participants were collected by survey method. Katz Activities of Daily Living (ADL) Scale and Loneliness Scale for the Elderly (LSE) were used for data collection.

Results: Of the participants 40.3% requested home visits and 83.3% of these requests were fulfilled. Of the fulfilled requests, 82.9% were provided by home healthcare services, 13% by family physicians, and 3.3% by municipal services. It was observed that individuals who needed home visits were mostly women, widowed, living with a family caregiver, and with low income levels. Individuals with lower ADL scores had a higher need for home visits.When the loneliness levels were analyzed, 43.5% of the participants stated that they did not feel lonely, while 24.5% stated that they felt intense or very intense loneliness.

Discussion: It was observed that the rate of dependent individuals requesting home visits and utilizing from this service was higher than other groups. So we easliy can tell that the need for home visits among individuals aged 80 and above is directly associated with dependency levels.

Conclusion: The need for home visits among individuals aged 80 and above is directly associated with dependency levels and sociodemographic factors. Primary care physicians can dentify and prioritize the groups with the greatest needs and to increase the public awareness and knowledge about home visit services. Key words:aging, daily living activities, loneliness, home care

ID 2110- Use of Patient-Reported Experience Measures to capture caregiver experience in a primary care home care programme.

Inés ARANCIBIA FREIXA [(1)] , Carlos MARTÍN CAICEDO [(2)], Josep Maria VILASECA LLOBET [(1)]

(1) Medical, Manresa, Espagne
(2) Nurse, Manresa, Espagne

Context: Home care delivered by primary care teams plays a key role in the follow-up of frail and complex patients. The systematic assessment of patient and caregiver experience remains limited in routine practice, even though such information is essential for quality improvement of person-centred care models. Validated Patient-Reported Experience Measures offer an opportunity to integrate experiential data into everyday clinical practice.

Objectives: To assess caregiver experience in a primary care home care programme using the PPE-15 PREM questionnaire and to explore the feasibility and added value of routine experience measurement in family medicine.

Methods: A cross-sectional observational study was conducted within a primary care-led home care programme. All caregivers (n = 79) were invited to complete an anonymous survey. The questionnaire assessed accessibility, communication, continuity of care, professional competence, emotional support and overall satisfaction. Data were collected using Google Forms. Items were rated on 5-point Likert scales. Descriptive analyses were performed overall.

Results: A total of 38 surveys were analysed, yielding a response rate of 48.1%. Most responses were provided by informal caregivers. Experience ratings were consistently high across all dimensions, with mean scores up to 4.76 (SD 0.48). Professional competence (9.6 ± 1.035), respectful treatment (9.93 ± 0.4), and clarity of communication (9,87+/-0.7) received the highest ratings. Accessibility and understanding of care pathways were also rated very positively. Overall satisfaction and willingness to recommend the programme were high (mean recommendation score: 4.76/5). Qualitative comments highlighted feelings of safety, trust, and continuity of care.

Discussion: These findings suggest that measurement of caregiver experience is feasible in a primary care home care setting and yields meaningful, practice-relevant information. High ratings across domains reflect the importance of relational continuity, communication and professional competence in home-based care for complex patients. The qualitative feedback provides complementary insights that may help teams identify specific areas for improvement. Incorporating experiential data into routine evaluation may strengthen person-centred care.

Conclusion: The integration of validated PREMs into a primary care home care programme provides valuable insights into caregiver experience and supports continuous quality improvement. This approach may inform the design and scalability of similar home care models across primary care settings.

ID 2051 - Artificial Intelligence in Home Health Care: A Literature Review and Implications for Primary Care Practice

Yakup Batuhan TUNA, Elifnaz TUNA, Yasemin ÖZKAYA, Bakiye Nurdan TEKGÜL, Umut GÖK

University Of Health Science İzmir City Hospital, İzmir, Türkiye

Context: The use of artificial intelligence (AI) in healthcare has expanded rapidly, particularly in hospital-based and diagnostic settings. In contrast, AI applications in home health care closely linked to primary care and community based services remain less clearly defined and unevenly implemented.With ageing populations, increasing chronic disease burden, and growing workforce shortages, AI-supported home health care may offer important opportunities to strengthen primary care systems. At the same time, concerns related to patient autonomy, equity of access, and the preservation of humanistic care highlight the need for a clearer understanding of existing evidence, applications, and challenges.

Objectives: To screen literature on the use of artificial intelligence in home health care, identify key application areas, reported benefits, and implementation challenges, and explore the implications for equitable, patient-centered primary care practice.

Methods: A literature review was conducted using PubMed. Publications indexed up to December 2025 were identified using the search terms “home health care” AND “artificial intelligence.” Following abstract screening, 12 studies were deemed eligible for inclusion.

Results: Four main thematic areas emerged from the reviewed literature. First, AI-supported clinical decision-making and patient monitoring tools were reported to enhance nursing documentation, wound care management, and predictive analytics, potentially improving clinical accuracy while raising concerns about their integration into relational and hands-on caregiving. Second, operational and economic impacts were described, with remote monitoring systems demonstrating improved care coordination and cost reductions. Third, implementation challenges highlighted technical complexity, ethical considerations, data governance issues, and limitations in maintaining person-centered relationships central to primary care. Finally, global and preparedness-focused studies particularly from low and middle income settings emphasized inequalities in access, population readiness, and the importance of education and infrastructure for responsible AI adoption.

Discussion: AI-supported home health care has the potential to strengthen continuity of care, support preventive and chronic disease management, and reduce workload pressures in primary care. However, successful integration requires safeguarding patient liberty through shared decision making, promoting equity in access and resource allocation, and preserving the humanistic values at the core of family medicine.

Conclusion: For family physicians, understanding AI-enabled home care tools is increasingly important to ensure ethical,patient-centered,and socially responsible implementation within community based health systems.

ID 1523- Patient-centered integrated model of home healthcare services in xxx: a three-year pilot study

Serng PAK

Nhis Ilsan Hospital, Goyang-Si, Corée, République de

Context: An aging society faces rapid population growth of elderly with 12.2% experiencing activity limitations. Despite 16,092 long-term care beneficiaries in the study city, only 5 home visits were recorded in 2020. Existing community-based integrated care initiatives showed fragmented service delivery with only 0.4% physician participation, highlighting critical gaps in home healthcare coordination.

Objectives: To develop and evaluate a patient-centered integrated home healthcare model linking regional hub hospitals with primary care physicians through multidisciplinary team-based care coordination for homebound patients.

Methods: This three-year pilot study (August 2021-December 2023) established a Home Healthcare Support Center at a regional hub hospital. The model featured six core components: multilevel

integration of hub hospital-primary care-nursing-welfare services; care coordination hub with multidisciplinary team; enhanced accessibility through digital platforms; daily interdisciplinary team meetings with individualized care plans; patient-tailored service delivery using standardized assessment tools; and home healthcare education programs. Primary care physicians provided home visits while the hub hospital offered multidisciplinary backup including emergency visits and specialist consultations. Outcomes included service linkage rates, satisfaction surveys, and healthcare utilization. Interrupted time series analysis assessed intervention impact on expenditure trends.

Results: One hundred ninety-five homebound patients were enrolled (mean age 80.4 years, 65.6% female). Service linkage rates were high: visiting nurse services 96%, long-term care services 86%, and welfare services 71%. Patient/caregiver satisfaction reached 96%; physician satisfaction 93%. Interrupted time series analysis demonstrated statistically significant trend changes: overall healthcare costs shifted from increasing to decreasing ($p<0.001$). Hospitalization costs showed pronounced effects with the same pattern ($p<0.001$), indicating prevention of unnecessary hospitalizations through appropriate home management.

Discussion: The model demonstrated that hub hospital-based coordination can effectively support community primary care through multidisciplinary integration. The care coordinator role emerged as essential for managing patient assessment, service linkage, and crisis intervention. The model influenced national policy development, informing primary care development initiatives and contributing to national primary care innovation pilot programs.

Conclusion: This patient-centered integrated model represents a viable approach for community-based integrated care in aging societies, demonstrating both high satisfaction and cost-effectiveness through prevention of avoidable hospitalizations. Successful implementation requires payment model innovation, home patient management fees, and information-sharing platforms.

ID 907- Multidisciplinary Management for 77-Year-Old Retired Military with Probable Occupation-Related Spindle Cell Myelopleiomorphic Sarcoma of Right Forearm: A Case Report

Erica Tania DAVILLO

Department Of Family And Community Medicine Perpetual Help Medical Center Binan Laguna Philippines / Philippine Academy Of Family Physicians / Armed Forces Of The Philippines / Harvard Medical School / Philippine Medical Association / Philippine College Of Occupational Medicine, Valenzuela, Philippines

Context: Spindle cell sarcoma is a rare malignant tumor of mesenchymal origin, comprising 1% of adult cancers and 2–5% of bone malignancies. More common in men, with median diagnosis at 62 years, it carries poor prognosis due to aggressive behavior. The pleomorphic undifferentiated subtype is most frequent, often affecting arm, leg, or pelvic bones. Occupational exposures, such as military service, may contribute to its development. This case highlights the need for integrated biomedical care, nutritional support, and occupational health in managing rare sarcoma presentation.

Methods: Report a 77-year-old retired military officer with probable occupation-related spindle cell myelopleiomorphic sarcoma of the right forearm. Laboratory and imaging studies guided surgical intervention, complemented by nutritional screening to address undernutrition and restore ideal body weight. A tailored plan included oral supplements, dietary adjustments, multivitamins, and trace elements. Occupational history was considered to account for long-term exposures influencing disease progression and nutritional risk.

Originality: This case is notable for integrating biomedical care with nutritional intervention and occupational health considerations. Beyond documented spindle cell sarcoma cases, the deliberate focus on undernutrition and occupational assessments highlights a novel

Lessons learned and future implication: The case underscores nutrition as a cornerstone of readiness in complex malignancies and highlights occupational context in patient care. Future

implications include standardized nutrition protocols in sarcoma pathways, strengthening occupational health a

Discussion: The outcome illustrates that liberty in health is achieved when patients are empowered through adequate nutrition, equity is advanced when vulnerabilities are addressed through multidisciplinary care, and fraternity is embodied when families, occupational context, and healthcare providers collaborate. Success in sarcoma management is not solely technical but deeply dependent on holistic preparation.

Conclusion: This case exemplifies how biomedical, nutritional, psychosocial, and occupational integration can transform outcomes in rare spindle cell sarcoma. It advocates liberty through patient empowerment, equity through comprehensive care, and fraternity through solidarity among families, communities, and healthcare teams principles resonant with 30th WONCA Europe Conference theme and global primary care values.

ID 552- Rehabilitation as a bridge to home: reflections on Taiwan's post-acute care system for older adults

Wei-Cheng WANG, Ju-Chien JENG

China Medical University Hospital, Taichung City, Taïwan, République de Chine

Context: As Taiwan enters a super-aged society, demand for transitional and long-term rehabilitation is increasing. The National Health Insurance Post-Acute Care (PAC) program provides coordinated inpatient, day-care, and home-based rehabilitation for older adults after stroke, fractures, or functional decline. Unlike fragmented systems in many Western countries, Taiwan's PAC model links hospitals, rehabilitation teams, and community services. This reflection is based on practice in a tertiary rehabilitation ward and outpatient PAC follow-up.

Methods: Older adults received individualized assessments and goal setting through a multidisciplinary team. Family meetings clarified expectations, evaluated home readiness, and identified caregiving challenges. Many initially viewed rehabilitation as purely physical recovery. Through communication and shared decision-making, goals were reframed to emphasize autonomy, dignity, caregiver capacity, and quality of life. This reflection synthesizes observations across inpatient and community PAC encounters.

Originality: Taiwan's PAC system is one of the few universal, policy-driven post-acute models in Asia. It demonstrates how continuity and equity can be achieved through national insurance and coordinated interprofessional care. This reflection provides an insider view

Lessons learned and future implication: Functional gains alone do not guarantee a successful return home. Rehabilitation outcomes depend on caregiver readiness, realistic expectations, social support, and culturally informed communication. The PAC environment promoted interprofessional learning

Discussion: Experiences in PAC showed that rehabilitation is both a clinical and relational process shaped by patient needs, family capacity, and community resources. The program fostered ethical reflection and collaborative problem-solving.

Conclusion: Taiwan's PAC system demonstrates how person-centered continuity can be implemented in an aging society. By bridging hospitals, families, and communities, rehabilitation supports not only functional recovery but also dignity, purpose, and human connection—lessons relevant to primary care worldwide.

Corresponding author: Wei-Cheng Wang, waynewang1021@gmail.com

ID 2301- High Caregiver Burden at Admission to Acute Hospital-at-Home: Prevalence and Associated Factors

Shira DUHAMEL

Md., , Israël

Context: Acute Hospital-at-Home (HaH) programs depend on family caregivers to support patients during acute illness. Despite their central role, caregiver burden at the start of HaH remains insufficiently characterized in real-world settings.

Objectives: To assess the prevalence of caregiver burden at HaH admission and to identify caregiver- and patient-related characteristics associated with high burden

Teaching method and workshop: Caregiver burden was assessed within 48 hours of admission using the Caregiver Strain Index (CSI). Caregiver sociodemographic characteristics, caregiving context, health-related quality of life (EQ-5D-5L and EQ-VAS), resilience (CD-RISC-2), and perceived

Expected outcomes: High caregiver burden at admission was common (77/125; 61.6%). Compared with caregivers with low burden, those with high burden more frequently reported problems in anxiety/depression (63.6% vs 29.2%; p<0.001), pain/discomfort (54.6% vs 27.1%; p=0.003), a

Conclusion: Most caregivers enter HaH with substantial burden. Emotional distress, physical symptoms, limited perceived support, low resilience, and pre-existing caregiving responsibilities are key determinants. Early caregiver assessment at HaH admission may help identify vulnerable caregivers and guide targeted support to improve caregiver well-being and sustain safe home-based acute care.

How not to make babies

ID 2069- Women and natural contraception in XXX

Jessica DUMEZ [(1)] , Nasrine MAOULIDA [(2)], Albert DUCASTEL [(3)], Raphaël MAOULIDA [(4)], Elhad MOHAMADI [(4)]

(1) Faculté De Santé, Terre-Sainte, La Réunion, Boueni, Mayotte
(2) Faculté De Santé, Terre-Sainte, La Réunion, Tsingoni, Mayotte
(3) Maison De Santé, Mamoudzou, Mayotte
(4) Maison De Santé Ali Combo Moinecha, Ouangani, Mayotte

Context: In XXX, one-third of women who did not want children did not use medical contraception; some of these women used natural methods of contraception, hoping for effective results.

Objectives: The objective of this study was to understand why, despite a need for contraception, some women in XXX use natural methods.

Methods: The study was qualitative and phenomenological. The sampling was purposive and homogeneous. Recruitment from private practices and community health centers in XXX was gradual, allowing for a diversification of profiles. The interviews were individual and semi-structured.

Results: Thirteen interviews were conducted between June 9, 2023, and September 22, 2023, inclusive. The reasons for using medical contraception were: weariness following multiple trials of medical contraceptives, fear of side effects rather than infertility, and long-distance relationships. It should be noted that confidence in the effectiveness of natural contraception was not a prerequisite for its use. However, when confidence was present, it stemmed from three factors: the misleading scientific legitimacy of information sources, the illusion of knowledge bias based on school memories, and the positive experiences of other women. Knowledge about the natural contraception methods used was incomplete, thus increasing the risk of failure. This failure was the main reason for returning to medical contraception. Natural contraception was generally well-tolerated.

Discussion: The two predominant languages of XXX were used for the interviews, allowing for more accurate expression from the participants. The fact that the researcher shared the same culture as the majority of the participants facilitated understanding of their context. However, due to this close relationship, a review of the expected

responses was conducted to mitigate the illusion of knowledge bias.

Conclusion: To avoid uninformed choices, establishing the legitimacy of healthcare professionals in providing advice on natural contraception is essential in a strategy to reduce the risk of unintended pregnancy. Similarly, the range of contraceptive options must be diversified to include male contraception, in order to address the dissatisfaction some women feel with medical contraceptive methods.

ID 1285- Integrating Medical Abortion Into General Practice in the Netherlands: A Multi-Stakeholder Analysis Using the Rainbow Model of Integrated Care

Liana GENOVA

De Zoed Haarlem Zuid, Haarlem, Pays-Bas

Context: Recent legal changes in the Netherlands allow general practitioners (GPs) to provide medical termination of pregnancy (MToP). This development enhances accessibility and continuity of care but requires integration across clinical, organisational, and societal levels. Understanding how MToP fits within daily practice and broader health system structures is crucial, particularly in an international context where reproductive healthcare access remains uneven.

Objectives: To explore how MToP can be sustainably integrated into Dutch general practice using the Rainbow Model of Integrated Care (RMIC), and to identify facilitators/barriers across stakeholders.

Methods: A qualitative study was conducted using the six RMIC domains as an analytic framework. Semi-structured interviews were held with GPs, psychologists and nurse practitioners, pharmacists, gynaecologists, midwives, abortion physicians, patients, policymakers, insurers, NGOs, and educators. Topic lists were tailored to each group, addressing practical, organisational, ethical, and normative dimensions. Mixed focus groups (GPs, pharmacists, midwives, abortion physicians, policymakers) explored shared challenges and cross-sector solutions. Sessions were recorded, transcribed, and thematically analysed per RMIC domain.

Results: Preliminary analysis indicates that many GPs emphasise being overworked and hesitant to take on additional responsibilities. Nonetheless, a subset recognises clear added value in offering MToP, particularly in terms of continuity, accessibility, and patient-centred care. For these GPs, existing trust-based relationships with patients are seen as a key facilitator. Pharmacists report dispensing MToP is feasible if supported by clear communication and standardised protocols. Collaboration with abortion clinics and gynaecologists is constructive, though responsibilities for consultation and complication management require clearer agreements. Barriers identified include uncertainty around legal procedures and documentation, inconsistent reimbursement structures, fragmented ICT systems, and persistent stigma affecting both patient help-seeking and professional comfort. Patients emphasised privacy, non-judgmental communication, and timely access. NGOs and educators highlighted the need for structured training and public information to normalise abortion care in primary care.

Discussion: Integrating MToP into general practice is feasible and welcomed by multiple stakeholders but depends on strengthened collaboration, clearer governance, functional ICT support, and ongoing education.

Conclusion: The RMIC framework underscores that sustainable implementation requires not only clinical readiness but also shared values, supportive policies, and coordinated system design—insights relevant for other countries seeking to expand primary-care-based abortion services.

ID 1188- Freedom, equality, contraception: a joyful revolution. Qualitative study on the barriers and motivations of testicular contraception users

Romain VERDEAU, Nolwenn LE MENN, Marie BARAIS

Spurbo, Brest, France

Context: Testicular contraception (TC) works, with an estimated Pearl Index (PI) of 2.34, calculated over a total of 512 months of pregnancy exposure. The PI is comparable to that of female oral contraceptives in common use.

Objectives: The primary objective was to explore users' expectations regarding TC devices. The secondary objectives were to understand the reasoning behind choosing a TC, gather TC users' experience, analyze their perceptions of the associated benefits and risks, and identify areas requiring improvement in medical supervision.

Methods: A qualitative study using semi-structured individual interviews was conducted with users of testicular contraception. The population surveyed consisted of adult men who had already used testicular contraception for more than 30 consecutive days, in conjunction with the Thomas Bouloù association (XXX)

Results: TC users perceived it as an act of activism and solidarity with their partner, but also as a means of empowerment. Despite social, personal, and practical obstacles, their paths were often similar: seeking information, meeting with the Thomas Bouloù association, medical consultation, and then a spermogram. This step was often negatively experienced.

Discussion: One of the major obstacles preventing users from initiating and continuing TC was the semen analysis. There are no recent studies on masturbation in laboratories, the quality of the erotic magazines and videos provided, or the reception or rendering of the sample, which appeared to be the obstacles identified during the study. No study has analysed the experience of spermograms in a contraceptive pathway. Future prospects include greater accessibility to spermograms, improved laboratory reception, and institutional recognition of TC.

Conclusion: Users of testicular contraction become information relays, carrying a feminist vision and strong societal expectations.

Corresponding author: Nolwenn Le Menn, nolwenn.lemenn@gmail.com

ID 943- Predictors of early intrauterine device discontinuation among XXX women aged 18–50: a multicentre cross-sectional study

Fanny SERMAN [(1)] , Héloïse RAUX [(1)], Sophie CATTEAU-JONARD [(2)], Isabelle BODEIN [(1)], Gabrielle LISEMBARD [(1)]

(1) Department Of General Medicine, University Of Lille, Lille, France
(2) Epartment Of Endocrine Gynecology And Reproductive Medicine, University Of Lille, Chu De Lille, Lille, France

Context: Unintended pregnancies remained common in Europe in 2023. IUDs (intrauterine devices) are a highly effective form of long-acting contraception that is widely used in XXX and around the world. They are over 99% effective, have low complication rates and are generally well tolerated. However, discontinuation still occurs; the main reasons for removal were bleeding and abdominal pain, alongside spotting, mood changes and the desire to become pregnant. Although several studies suggested that characteristics such as age, parity, BMI or STI history may influence early removal, the results were inconsistent. Therefore, understanding the determinants of early IUD discontinuation was essential to improve counselling and satisfaction, and to promote long-term contraceptive use.

Objectives: This study aimed to compare the characteristics of XXX women aged 18–50 who removed their IUD less than one year after insertion with those who retained it for over one year. A secondary objective was to explore discontinuation reasons by IUD type and duration of use.

Methods: An epidemiological, retrospective, analytical, cross-sectional multicentre study was conducted in XXX from February to June 2024. A 31-question survey was distributed in healthcare settings and via digital platforms. Socio-demographics, IUD insertion details, and self-reported reasons for discontinuation data were collected from women who had a copper or levonorgestrel IUD removed within the last 10 years.

Descriptive analyses, as well as univariate and adjusted multivariable logistic regressions, were performed.

Results: Of 380 respondents, 26% removed their IUD within a year. Having a body mass index ≥ 30, a history of miscarriage, and insertion by a non-gynaecologist were associated with early removal. Common reasons included pain, heavy or irregular bleeding, and mood changes. Women with copper IUDs often reported heavy bleeding, while those with levonorgestrel IUDs cited spotting or mood shifts.

Discussion: These findings suggest that BMI, prior miscarriage, and the healthcare provider's professional background may predict early IUD discontinuation. Nonetheless, most other characteristics were not associated with early removal, indicating that such factors need not deter IUD use.

Conclusion: Comprehensive counselling on potential side-effects and robust follow-up could enhance satisfaction and prolong IUD retention.

Corresponding author: Fanny Serman, fanny.serman@univ-lille.fr

ID 875- Variation of the Uterine Flexion Angle Before and After Voiding in Nulliparous Women with Anteverted Uterus: The FLEXIMIX Study

Paul AUJOULAT, Benoit CHIRON

Ubo, Brest, France

Context: Insertion of an intrauterine device (IUD) is frequently painful and technically challenging, particularly in nulliparous women. Clinical experience suggests that bladder filling may reduce uterine anteflexion and thereby facilitate cervical–uterine alignment, yet evidence remains limited. The influence of bladder volume on uterine flexion has never been precisely quantified.

Objectives: To assess the variation in uterine flexion angle before and after voiding in nulliparous women with anteverted uteri. Secondary objectives were to determine: (1) the proportion of women whose uterine flexion angle changed from acute to obtuse with bladder filling; (2) the prevalence of uterine anteversion; and (3) the variation in the distance between the external cervical os and the flexion point.

Methods: This monocentric cross-sectional study included 250 healthy nulliparous women aged ≥18 years. Each participant underwent suprapubic pelvic ultrasound with a full bladder, followed by a second scan after voiding. Uterine version and flexion angles were measured using standardized anatomical axes; distances from the external os to the flexion point were recorded. Paired comparisons were performed using Wilcoxon signed-rank tests.

Results: Among 212 women with interpretable anteverted uteri post-void, the mean flexion angle increased significantly with bladder filling (130.9° vs. 83.0°, mean difference +47.9°, $p < 0.001$; Cohen's $d = 1.31$). Overall, 60.8% of participants shifted from an acute to an obtuse flexion angle, rising to 70.8% among women with anteverted uteri. The prevalence of uterine anteversion was 87.0%. The mean distance between the external os and the flexion point increased slightly with bladder filling (21.4 mm vs. 20.3 mm).

Discussion: Bladder filling induces a large and clinically meaningful straightening of the uterus in most nulliparous women, supporting the physiological rationale for improving IUD insertion conditions through simple pre-procedural bladder filling. Heterogeneity in bladder volumes and the use of suprapubic ultrasound may have influenced individual measurements, but the magnitude and consistency of the effect suggest robust findings.

Conclusion: A full bladder markedly reduces uterine anteflexion in nulliparous women. These data justify clinical trials evaluating bladder filling as a strategy to improve technical ease and comfort during IUD insertion.

ID 603- Shifts in Family Medicine Provision of Contraception in the United States Following State Abortion Restrictions

Risa GRIFFIN, Julia STRASSER, Qian LUO, Maria PORTELA

George Washington University, Washington, Dc, États-Unis

Context: Abortion and contraception are essential for reproductive autonomy and equity, and family physicians can provide both. However, xxx has imposed growing policy restrictions on abortion that will likely affect contraception.

Objectives: This study examines differences in family physician contraceptive service provision in abortion-restrictive regions compared to non-restrictive regions in xxx.

Methods: This cross-sectional, observational study used a national-level medical and prescription claims dataset (xxxx), which has detailed medical encounter information on xxx million patients in xxx. We analyzed contraceptive methods provided by family physicians in 2024: prescriptions (pill, patch, and/or ring), IUDs, implants, Depot Medroxyprogesterone Acetate (DMPA), tubal sterilizations, and vasectomies. Combining this data with xxx data, we calculated the regional ratio of family physicians to the population of reproductive age by policy category, as well as interquartile ranges to assess variation within categories. This abstract reports early findings from an ongoing study, with full results anticipated in early 2026.

Results: We enumerated family physicians providing implants (9,025), IUDs (7,707), DMPA (22,373), prescriptions (91,437), tubal sterilizations (809), and vasectomies (1,099). For abortion-restrictive regions, the ratios of family physicians providing implants, IUDs, and DMPA were 7.7 (interquartile range: 8.9), 5.6 (IQR: 14.3), and 21.3 (IQR: 24.1)/ 100,000 women of reproductive age, respectively. Non-restrictive regions had ratios of 14.2 (IQR: 15.7) for implants, 12.8 (IQR: 16.4) for IUDs, and 33.8 (IQR: 36.0) for DMPA. Prescriptions had relatively higher ratios of 110 (IQR: 61.3) in restrictive regions and 123 (IQR: 68.6) in non-restrictive regions. Tubal sterilization and vasectomy had low ratios overall.

Discussion: We found substantial region-level variation in the ratio of family physicians providing contraception. We found higher ratios of family physicians to population in regions with fewer abortion restrictions for methods implant, IUD, and DMPA; we found little or no difference for prescription methods pill, patch, and/ or ring, tubal sterilization, or vasectomy.

Conclusion: As abortion access has become substantially restricted across xxx, access to contraception is critical. Family physicians are access points, especially in rural areas but may face additional barriers to providing care in regions that restrict access to reproductive health.

ID 103- Role of Family Structure in Family Planning Use in India: Evidence from Three Rounds of the National Family Health Survey

Dewaram NAGDEVE, Sagar INGLE

International Institute For Population Sciences, Mumbai, Inde

Context: Industrialization and modernity have shifted India's joint families to nuclear ones, influencing family planning decisions. Family structure affects women's autonomy, fertility, and health service use. In nuclear families, women have greater reproductive freedom, while joint families—dominated by elders—often discourage contraception, limiting maternal health access and family planning adoption.

Objectives: To examine the relationship between family structure and family planning use in India using data from the third, fourth, and fifth rounds of the National Family Health Survey (NFHS), and to assess how household composition influences contraceptive adoption and reproductive health behavior.

Methods: The study used data from the NFHS (2005–06, 2015–16, 2019–21) conducted by IIPS, Mumbai, covering over 99% of India's population. The outcome variable was family planning use among married women (15–49 years), categorized as modern limiting, modern spacing, traditional, or non-use. The key explanatory variable was family structure (nuclear, joint, extended), along with

demographic and socioeconomic factors such as age, caste, education, residence, wealth, parity, and region.

Results: Results show that family structure significantly influences family planning use across NFHS rounds. Women in nuclear (51.7%) and joint families (40.3%) were more likely to use contraception than those in extended families. Modern limiting methods remained dominant, while traditional methods increased, reflecting social and access barriers. Family planning use was higher among older, educated, wealthier, and media-exposed women. Regional variation showed higher use in southern and northeastern states, and lower in northern and central zones. Logistic regression confirmed that nuclear and joint family women had higher odds of using family planning, even after controlling for socioeconomic and demographic factors.

Discussion: This study using NFHS-3, 4, and 5 data found that family structure significantly affects family planning use in India. Women in nuclear families use contraception more than those in joint or extended families. Modern limiting methods dominate, with education, wealth, media exposure, and regional differences strongly influencing contraceptive behavior.

Conclusion: The study concludes that family structure, education, wealth, parity, and media exposure strongly influence family planning use in India. Addressing unmet needs and promoting modern spacing methods, particularly in northern and northeastern regions, is essential to improve equitable and effective family planning outcomes.

ID 2254- Specific aspects of primary health care and the care process in the context of deprivation of liberty: an experience report from a visit to a penitentiary..

Giovanna GARCIA GARDINI, Mariana HASSE

Faculty Of Medicine Of The Federal University Of Uberlandia, Uberlândia, Brésil

Context: XXX has the XXX largest prison population worldwide. Although national legislation guarantees full access to health care through the XXX Unified Health System (XXX), equivalent to that offered to the general population, prison health care presents specific challenges, particularly regarding the use of soft technologies to support humanized care. In this context, an undergraduate research project provided a medical student with experiential exposure to primary health care delivery within a penitentiary setting.

Methods: This experience report reflects on a 2024 visit to a prison unit in XXX, XXX, conducted during an undergraduate research project.

Originality: The experience highlights the use of soft health technologies in a prison setting, emphasizing individualized health promotion strategies co-developed by health professionals and incarcerated individuals.

Lessons learned and future implication: In the visited penitentiary, the primary health care team, composed of a physician and nurses, is responsible for health promotion and disease prevention actions for the incarcerated population. Constant humidity and overcrowding in the cells influence fr

Discussion: The development of social technologies by the health team was evident in the waiting area, where inmates, required to sit facing the wall, observed their own illustrations displayed on a mural in front of the chairs. At the end of the visit, the prison newspaper was distributed - a monthly publication developed by incarcerated individuals and health staff - containing drawings, word searches, and handwritten texts. One highlighted headline read: “Using crack with steel wool: what are the health consequences?”, emphasizing the importance of individualized health promotion for effective outcomes. These practices demonstrate the potential of contextualized health education strategies within prison environments.

Conclusion: The visit provided essential insight into health care within the context of deprivation of

liberty, contributing to the student's academic training and reinforcing the importance of primary health care and individualized health promotion strategies in prison settings.

Corresponding author: Giovanna Garcia Gardini, ggardini01@gmail.com

ID 2245- A biopsychological health profile of incarcerated adults in Tunisia: Implications for primary healthcare physicians.

Mariem GALAAOUI, Imen MLOUKI, Emna HARIZ, Aya AJMI BLOUT, Haythem AYACHI, Ahmed TRIGUI, Sana EL MHAMDI

department Of Preventive And Community Medicine, University Hospital Tahar Sfar, Mahdia, Mahdia, Tunisie

Context: Incarceration and its underlying conditions expose individuals to discontinuity of care and unmet health needs. These experiences are strongly associated with mental health problems, sleep disorders, and health-risk behaviours. Despite these intersecting vulnerabilities, the incarcerated population remains underrepresented in the health literature.

Objectives: To describe the biopsychological health characteristics of incarcerated adults in Tunisia and to identify health inequities in order to support the role of general practitioners in delivering primary care to this underserved population.

Methods: We have conducted two cross-sectional studies among adult male (April 2023) and female prisoners (July 2024). Participants in this research voluntarily completed an anonymous questionnaire covering different factors using Arabic validated versions of the Rosenberg self-esteem scale, the Pittsburgh Sleep Quality Index, and the Hospital Anxiety and Depression Scale.

Results: A total of 568 prisoners answered our questionnaire. Among them, 403 were males, and 165 were females. In our sample, 53.5% of the research subjects were aged 30 and higher. The reported chronic conditions were diabetes (11.6%), hypertension (17.6%), coronary artery disease (7.0%), pulmonary disease (17.3%), liver disease (3.7%), kidney failure (9.0%), cancer (1.4%), immunodepression (15.7%), and HIV infection (2.3%). Additionally, 70.8% of the included inmates were smokers, 51.9% were alcohol consumers, 47.2% used other drugs, and 51.4% had sexual risk behaviors. Our results highlight that 37.9% of the sample had suicidal ideation, 44.7% were self-harming, 20.1% had low self-esteem and 84.5% suffer from sleep disturbance.

Discussion: Prison health is an integral component of primary healthcare systems. Our study highlights the high prevalence of chronic disease, mental health symptoms, sleep disturbances, and health-risk behaviors. These findings suggest that prison health services remain insufficient. Primary care physicians need to strengthen their person-centred approach to care by implementing systematic screening, early intervention, and continuity of care after discharge.

Conclusion: Incarcerated adults in Tunisia experience overlapping biopsychological health vulnerabilities. Expanding routine screening for chronic and mental health conditions, ensuring continuity of care, and reinforcing mental health and psychosocial support are essential to leveraging primary healthcare. Keywords: Prisoners, Primary Health Care, Mental Health, Chronic Disease

ID 727- Regular medical humanitarian immersions in different foreign cultures : can it be an added value for our busy life?

Jean-Claude LENERS

Gp Geriatrics Palliative Medicine, Ettelbruck, Luxembourg

Context: Since 35 years every 2d year , I do a 6 weeks' mission abroad in areas where no doctors work.

Methods: Method: The NGO sends the doctors and local nurses work with us in remote areas. 2 nurses, 1 driver and the doctor are on "rolling clinics" and every day you join another village. Working some 8 hours and 10 days continuously

before 2 days break. Strengths: All conversation is in English (local languages translated) and 40 well chosen drugs are available; 40 to 70 patients consulted per day; food is supplied for malnourished children ; only basic equipment exists , but a mini-ultrasound helps for better accuracy. Limitations: no operations can be paid; for tuberculosis diagnostic, we "try" to convince the patients to go for further tests ; the psychological support can be offered, but living conditions can`t be improved; clinical exam in public areas is challenging and drugs "given free " for one family member is often used for all the children ….

Originality: We think : "when the patient cannot come to us, we have to encounter him in his area", and some patients make still a 2 hours walking trail to see us. Nowadays communication is easier for follow-ups, but you can all the time be

Lessons learned and future implication: Equity for treatment does NOT exist for these patients and we must accept such setbacks every day and our housing with the team is basic, so less is sometimes more!

Discussion: Being in contact with indigenous people , like the Mangyans , gives you a unique chance to immerse in a culture where oral transmission is still very lively and where strong family bonds exist .

Conclusion: These short "medical immersions" in different cultures allow GPs to slow down with paperwork and get so much back from these fraternal interactions. The people in poor living conditions give us an example of daily struggle with dignity and in every consultation, they show us their ecological working and share great feelings with us . mission immersion dignity

ID 743- Humanist-existential themes in General Practice – a reflection on working with homeless people and other vulnerable groups

Christopher WURM

University Of Adelaide, Adelaide, Australie

Context: Salaried practice in a suburban setting in a city of about 1 million inhabitants in XXX.

Methods: This is a practice-based reflection in the form of a narrative review. The author reflects on how his identity as a GP has evolved since graduating in 1980 in XXX and completing GP training in 1987, ultimately becoming a Foundation Fellow of the XXX Chapter of Addiction Medicine, Royal XXX College of Physicians, and Life Member of the Royal XXX College of General Practitioners. The speaker was inspired as a medical undergraduate by the Existential Psychotherapy approach of Viktor E. Frankl. He chose to complete GP training rather than psychiatry. He now works as a government employee in a multidisciplinary outpatient service.

Originality: The presenter draws on the ideas of others, but synthesises their work in an original way, with references to acknowledge sources.

Lessons learned and future implication: Eventually I graduated and wanted to apply the existential counselling I had learned. I was offered a position in psychiatry training but opted to stay with General Practice. I found opportunities to use that knowledge to assist patients with adjustment d

Discussion: Although my initial post-graduate training was as a GP, I found work in two different university teaching hospitals in the state capital and was eventually given an academic title by the Discipline of Psychiatry at the local university, and institutes in XXX and XXX.

Conclusion: Humanist-Existential approaches fit well in General Practice and can be applied to a range of conditions, including substance use and homelessness.

ID 232- Providing Primary Care in a Correctional Rehabilitation Center: A

Practice-Based Reflection from Cardinal Tien Hospital, Taiwan

Jia Yun LIU

Cardinal Tien Hospital, New Taipei City, Taïwan, République de Chine

Context: Individuals in correctional rehabilitation centers face barriers to healthcare access, discontinuous care, and substance-use–related challenges. Since 2012, Cardinal Tien Hospital has provided multiple National Health Insurance–covered on-site clinics, with family medicine delivering most services. Detainees may request evaluation as needed, and family physicians also conduct health assessments for new admissions. This practice-based reflection summarizes the main characteristics, challenges, and clinical insights from our hospital's experience.

Methods: Data were drawn from the hospital's most recent correctional healthcare plan and the clinical experience of participating family physicians. Sources included on-site observations, service records, and referral procedures. These materials were synthesized into a reflective analysis to identify key themes and insights.

Originality: Our hospital has long collaborated with the local correctional rehabilitation institution. Yet literature describing correctional healthcare from a family medicine perspective in Asia remains limited. By integrating the official healthcare framework with

Lessons learned and future implication: On-site clinics improved healthcare accessibility and enabled earlier detection of acute conditions, while also reducing the need for escorted outside medical visits. A consistent physician enhanced trust and continuity of care; however, this is feasible

Discussion: Providing healthcare in correctional settings requires balancing security with the pursuit of health equity. Although on-site clinics are challenging to maintain, they remain essential for safeguarding detainees' right to equitable care. As a Catholic hospital, our participation reflects a commitment to compassion and fraternity, highlighting our responsibility to serve marginalized populations.

Conclusion: With support from Taiwan's National Health Insurance system and family medicine principles, primary care in correctional rehabilitation centers remains both feasible and essential. Ongoing cross-system collaboration and expansion of preventive services are key to promoting liberty, equality, and fraternity in the care of incarcerated populations.

Corresponding author: Jia Yun Liu, rosaline521520@gmail.com

In the field: GPs and primary care worldwide

ID 1964- Evaluation of a hybrid primary care payment model: the French "Médecin Traitant Renforcé" experiment

Nicolas DE CHANAUD, Nathanaël BEEKER, Roxane LIARD

Ipso Santé, Paris, France

Context: Primary care systems are facing increasing patient complexity, workforce shortages, and growing needs for prevention and care coordination. In France, the predominantly fee-for-service payment model insufficiently values non–face-to-face clinical work, preventive care, and team-based practice. The experimental "Médecin Traitant Renforcé" (MTR) programme, implemented in four primary care centers in Paris, introduced a voluntary hybrid payment model combining a monthly per-patient capitation fee with fee-for-service payments, centered on the general practitioner and structured multidisciplinary teams.

Objectives: To assess the impact of the MTR programme on preventive care practices, healthcare utilization, and health expenditures, compared with conventional fee-for-service primary care.

Methods: An observational medico-economic case–control study was conducted by an independent evaluator using linked data from the French National Health Data System (SNDS) from 2020 to 2023. A total of 13,156 patients enrolled in the MTR programme were matched to 39,548 control patients based on age, sex, socioeconomic indicators, clinical complexity, and prior healthcare expenditures. A difference-in-differences approach

was used to compare outcomes one year before and one year after programme entry.

Results: Patients enrolled in the MTR programme showed higher preventive care uptake, with increased screening rates for breast cancer (+4.3 percentage points), cervical cancer (+17.2), and colorectal cancer (+14.7), as well as higher influenza vaccination coverage (+9.8), compared with controls. The model was associated with organizational changes, including three times fewer changes of designated general practitioner, a higher annual number of general practice consultations (5.6 vs 3.8), and a significant reduction in full hospital admissions (7.2% vs 9.2%). Despite higher primary care expenditures, total reimbursed healthcare costs were 9% lower per patient (−€249), mainly driven by a 29% reduction in costs related to full hospitalizations.

Discussion: These findings suggest that a hybrid payment model may strengthen prevention, continuity of care, and reduce full hospital admissions, while lowering overall per-patient expenditures. However, results should be interpreted cautiously given the limited follow-up period and the specific experimental context.

Conclusion: The "Médecin Traitant Renforcé" programme appears to be a credible option for transforming primary care delivery, combining quality and efficiency, provided that capitation levels are appropriately calibrated and teams have sufficient organizational maturity.

ID 1544- Primary care in the state of Saxony, Germany: results of the 6th Saxon Epidemiological Study in General Practice (SESAM-6)

Willy GRÄFE [1] , Lukas LIEBIG [1], Tobias DEUTSCH [2], Antje BERGMANN [1], Markus BLECKWENN [2], Thomas FRESE [3], Henna RIEMENSCHNEIDER [1]

(1) Department Of General Practice, Faculty Of Medicine Carl Gustav Carus, Dresden University Of Technology, Dresden, Allemagne
(2) Institute Of General Practice, Faculty Of Medicine, University Of Leipzig, Leipzig, Allemagne
(3) Institute Of General Practice, Faculty Of Medicine, Martin Luther University Halle-Wittenberg, Halle, Allemagne

Context: In Germany, general practitioners (GP) are often the first point of contact for patients of all age groups and with different health problems. To date, there are only a few epidemiological overview studies that describe GP consultations on the basis of the reasons for and results of consultations as opposed to billing data. The 6th Saxon Epidemiological Study in General Practice (SESAM-6) systematically recorded the everyday work of GPs in consultations over the course of a year.

Objectives: The aim of SESAM-6 is to investigate the frequency of consultations, the prevalence of known long-term diagnoses and diagnostic and therapeutic decisions in GP practices.

Methods: The data collection of the cross-sectional study was conducted from October 2023 to September 2024 in GP practices in the state of Saxony, Germany. The participating doctors were randomly assigned one week per quarter (over a survey period of 12 months). Every fifth doctor-patient contact was recorded anonymously by the GPs by means of a questionnaire for half a day (morning or afternoon). Following data collection, the consultation occasions were coded according to the ICPC-2 classification system, while the permanent and new diagnoses were coded using ICD-10.

Results: N=109 GPs (59.8% women, mean age 47.2 years, 78.5% office-based) participated in the study, of which 21.5% worked in a rural area, 25.2% in a small town, 19.6% in a medium-sized town and 33.6% in a large city. N=7746 patients (53.7% women, average age 53.5 years) were documented, of which N=5340 (68.9%) had at least one chronic disease. The average consultation duration was 10.8 minutes (SD=6.8). The ten most common reasons for consultations were common cold (9.9%), medication/prescription (5.6%), cough (4.0%). The ten most common known long-term diagnoses were

Hypertension (41.7%), dyslipidemia (19.5%), diabetes mellitus type 2 (17.1%). The ten most common new diagnoses were upper respiratory tract infection (10.0%), back pain (4.3%), infectious gastroenteritis (2.3%).

Discussion: The data obtained can be used to develop evidence-based strategies for improving GP care. They will also be incorporated into the training and further education of GPs.

Conclusion: Based on the data, it is necessary to discuss which activities should be delegated to other occupational groups.

ID 1381- Assessment of the morbidity of patients enrolled in primary care models in Ontario, Canada

Lyn SIBLEY [1] , Jane YUAN [2], Sujita PANDEY [3], Fanor BALDERRAMA [4], Eliot FRYMIRE [5], Richard GLAZIER [6]

(1) Ontario Medical Association; University Of Toronto, Toronto, Canada
(2) Institute For Clinical Evaluative Sciences, Toronto, Canada
(3) Ontario Medical Association; Dalhousie University, Toronto, Canada
(4) Ontario Medical Association, Toronto, Canada
(5) Institute For Clinical Evaluative Sciences; Queen's University, Kingston, Canada
(6) Institute For Clinical Evaluative Sciences; University Of Toronto, Toronto, Canada

Context: It has been previously shown that the patients in different primary care physician payment models vary by level of morbidity. There are two different approaches for measuring morbidity or case-mix that are in common use in XXX: YYY and ZZZ. The YYY have been used extensively in research applications in XXX, while the ZZZ has been used more commonly for administrative and governmental applications including adjustment of capitation payments. Little is known about how the measures from these two methodologies compare with one another.

Objectives: To evaluate the morbidity, characteristics, and service utilization of patients who are enrolled in different primary care payment models, and to compare the two approaches for classifying patient case-mix.

Methods: In this cross-sectional study the morbidity, resource use, and health conditions of patients in each of the primary care payment models are compared using both approaches. The study includes all residents of XXX on March 31, 2023, classified as those who were formally or virtually enrolled in a primary care enrolment model (capitation, enhanced FFS, or other), virtually enrolled to a FFS physician, or not having a regular source of care. Patient characteristics include age, sex, income quintile, and geographic location.

Results: According to morbidity measures from the YYY, patients enrolled to physicians in enhanced FFS models had the highest level of morbidity while the ZZZ indicated that patients who were virtually enrolled to a FFS physician had the highest. Both approaches showed patients who did not have a regular provider had the lowest level of morbidity.

Discussion: Some of the observed differences in morbidity may be related to the specific data sources used by each approach or their underlying algorithms. Further analysis of these factors will be carried out along with an assessment

of their ability to explain actual service utilization.

Conclusion: The increasing use of the ZZZ in XXX necessitates a more integrated use of this approach in primary care research and evaluation. This study provides guidance on which aspects of the ZZZ are best suited to be reported on and used on a routine basis.

ID 1126- Implementing Universal Health Care in Underserved Communities thru WHO Health Systems Strengthening Framework

Katerina ABIERTAS

Local Government Unit Of Motiong Samar, Motiong Samar, Philippines

Context: Universal Health Care is about accessing quality health care at the time of need without financial hardship but access to health facilities and services remain a big challenge especially in the rural communities where transportation is limited. Konsulta is a program for health in the Philippines by Philhealth, a local health insurance provider, giving free outpatient services like medical consultations, essential laboratories and medicines to its members and dependents thru capitation payment to its accredited health facilities. The World Health Organization (WHO) health systems strengthening (HSS) framework analyzes health systems in terms of six core components or building blocks (service delivery, health workforce, health information systems, medical products, vaccines and technologies, health financing and leadership and governance).

Methods: Reaching To Care for UHC was established in Municipal Health Office of Motiong in 2023 utilizing WHO HSS Framework to assess the problems and to provide interventions to the identified gaps.

Originality: Linking Health Information System (HIS) and capacitating health human resource (HR) on its use with enabling support for provision of health services like transportation, incentives and medicines and technologies resulted to an almost P9,000,000 or 155,00

Lessons learned and future implication: With the use of WHO HSS Framework, Motiong was able to localize implementation of UHC by generating income thru capitation from Philhealth and utilizing this to provide more health services in communities closer to where people were residing.

Discussion: More defined problems lead to better suited plans and more focused results. By using the WHO HSS Framework in understanding problems and crafting solutions, led to more appropriate interventions and eventually better health outcomes.

Conclusion: Use of WHO Six Major Building Blocks as a health system strengthening tool and maximizing partnership with Philhealth through the use of validated Electronic Medical Record and enabling support to health workers, helped a small town in the Philippines to deliver more health services to people living in the grassroots.

ID 467- A Contract-Based Training System for Rural Physicians: Follow-Up of Jichi Medical University Graduates (1978-2021)

Jun WATANABE, Akihisa NAKAMURA, Daisuke MATSUBARA, Kazuhiko KOTANI

Division Of Community And Family Medicine, Jichi Medical University, Shimotsuke City, Japon

Context: The shortage of physicians in rural areas is a persistent problem. Policymakers and educators continue to seek effective strategies to increase and retain rural physicians. However, evidence on the long-term impact of rural medical education program remains limited.

Objectives: We aimed to assess the long-term outcomes of Jichi Medical University (JMU) in Japan, which provides tuition-free medical education in return for a 9-year rural service obligation and whose mission is to train and deploy physicians to rural communities.

Methods: This is a cross-sectional study of JMU graduates from 1978 to 2021. Follow-up rate was 97.0%. We excluded graduates who had died. The primary outcome was the retention rate of home-region. Secondary outcomes were the proportions practicing in medically underserved area and in primary care specialties. Medically underserved areas were defined as municipalities in physician-shortage areas/spots officially designated in 2021 under national criteria. Primary care specialties were defined as internal medicine, surgery, pediatrics, community/rural/general medicine based on self-declared specialties according to the previous study. Outcomes were reported separately for during-obligation and post-obligation periods; for secondary outcomes, the during-obligation period was defined excluding residency.

Results: Of 4610 JMU graduates, we analyzed 4534 for analysis; 19.0% were female. The retention rate of home-region during obligation was 98.0% over up to 9 years after graduation. After obligation, the retention rate of home-region was 71.0% up to 35 years. The proportions of JMU graduates practiced in medically underserved area were 24.8% during obligation and 12.1% after obligation. The proportions of primary care specialties were 78.5% during obligation and 62.0% after obligation. In medically underserved areas, 79.8% during obligation and 75.6% after obligation worked as primary care specialties.

Discussion: This study demonstrated JMU graduates maintained a high rate of rural practice even after completing their obligation. This was comparable to the 40–70% short-term regional retention reported in European rural programs. A limitation of this study was that we did not investigate determinants of retention.

Conclusion: Over approximately 45 years, JMU achieved sustained retention of home-region. Additionally, JMU graduates deployed to medically underserved area and to primary care specialties. These long-term results may serve as a reference for similar initiatives in Europe.

ID 98- Collaboration with Other Healthcare Professionals is Pivotal to Establish an Emergency Medical System in a Rural Private Hospital

Naoya KOBAYASHI

Okayama Saidaiji Hospital, Okayama, Japon

Context: Establishment of a community-based emergency medical system is important in a rural private hospital to address the aging rural population and decreasing human medical resources. Here I introduce my efforts to establish a functional medical care system under collaboration with other healthcare professionals, such as paramedics, pharmacists, dietitians, and medical social workers.

Methods: In my hospital, I simplified emergency medicine into 4 categories; trauma, hemorrhage, infection, failure of major organs. My hospital acted as a first responder for critical patients. I built a roof heliport, as capital investment, for air transportation. I contracted medical cooperation with Okayama University Hospital in order to transfer the patients with time-sensitive severe diseases. Once transferred patients recovered from most critical phases, they were readmitted to my hospital to have rehabilitation for going home. I shared the progress of patients with neighboring GPs and MSWs. Multi-disciplinary interactive meetings were regularly held in my hospital. As education for my employees, I invited special practitioners from Okayama University Hospital as lecturers about non-communicable diseases 3 times a year.

Originality: I have established a really functional medical system by collaborating with other healthcare professionals. As a result, the scale of my hospital has expanded and the hospital is now designated as a disaster base hospital in East Okayama Health and Medica

Lessons learned and future implication: The number of emergency patients accepted in my hospital was 441 cases in 2011 and increased 1653 cases in 2016. The emergency acceptance number has changed with around 1,600 afterwards until 2025. Priority of providable medical services, continued education

Discussion: My approach has improved the medical efficiency in rural health care settings. Under my instruction, neighboring GPs and healthcare professionals have taken unified action at disaster prevention trainings. Satisfaction and trust of rural residents to my hospital have increased and hospital management has been successfully maintained.

Conclusion: The establishment of multidisciplinary teamwork and interprofessional partnerships is indeed pivotal for addressing the complex, multifaceted medical needs of the aging population in rural healthcare settings.

Inequities

ID 2000- Community-based interventions to manage the frailty needs of people experiencing homelessness – a systematic review.

Natasha PALIPANE [(1)] , Ev CALLAHAN [(1)], Briony HUDSON [(2)], Caroline SHULMAN [(3)], Rafi ROGANS-WATSON [(3)], Joanna DAWES [(1)], Megan ARMSTRONG [(1)], Julie BRODERICK [(4)], Kate WALTERS [(1)], Cini BHANU [(1)]

(1) University College London, London, Royaume-Uni
(2) Marie Curie, London, Royaume-Uni
(3) Pathway, London, Royaume-Uni
(4) University College Dublin, Dublin, Irlande

Context: People experiencing homelessness (PEH) have higher rates and more severe forms of frailty than the general population. Frailty also manifests earlier with 40–50-year-olds experiencing frailty scores equivalent to 70–80-year-olds who are housed. Early detection and management of frailty can halt progression and reverse its trajectory. In the elderly population, management centres on integrated care models of screening and holistic assessments, and interventions targeting exercise, nutrition, medication optimisation and reablement. The applicability of these models to frail PEH remains unclear. With growing evidence for frailty affecting younger populations, more proactive, tailored strategies are needed to meet the unique needs of PEH.

Objectives: Explore the evidence for frailty management in PEH in community settings.

Methods: A search strategy using terms for 'homelessness', 'frailty' and 'community care' was conducted on 7 databases. Following deduplication, screening and full text review was carried out by three reviewers based on predetermined eligibility criteria (PROSPERO CRD420251143337). Data extraction, quality assessment using the Mixed Methods Appraisal Tool, and a narrative synthesis approach was undertaken. People with lived experience of homelessness were involved from conception of the research question through to results synthesis.

Results: Three studies were reviewed. Interventions consisted of a frailty health promotion education programme coupled with nurse case management, a drop-in exercise programme with nutritional supplementation, and a geriatric care model within a respite service. No significant effects on frailty were observed however the geriatric care model observed decreases in A&E visits, hospital admission and length of stay, cost of care and successful transition into permanent housing.

Discussion: This review highlights the dearth of frailty intervention research amongst PEH despite a high prevalence of frailty, further exacerbating health inequalities. Effectiveness of tested interventions may be limited by low intensity programmes, poor retention rates due to competing priorities (e.g. addiction), and lack of self-identification with 'frailty' as a diagnosis

Conclusion: Future interventions should be delivered at the "right time, in the right place, and by the right person" to maximise effectiveness. Service design needs to account for the specific drivers of frailty in PEH, a phenomenon still poorly understood, and should no longer discriminate based on age criteria.

ID 1542- Beyond Clinical Management: The Impact of Homelessness and Absence of Guardianship on Discharge Planning in a Palliative Care Setting

Aleyna UCAR, Olgu AYGUN

Izmir City Hospital, Izmir, Türkiye

Context: Palliative care units increasingly admit patients whose primary needs are social rather than medical, particularly in countries with limited long-term care, guardianship, and community-based support systems. Individuals experiencing homelessness with alcohol-related neurocognitive disorders represent a highly vulnerable population.This case highlights the challenges of managing a case with suspected Wernicke–Korsakoff syndrome who remained hospitalized for weeks due to the absence of family support, legal guardianship mechanisms, and feasible discharge options.This situation illustrates a profound

structural inequity in access to basic living conditions, raising concerns regarding justice, dignity-centered care, freedom of vulnerable individuals to access safety and appropriate services.

Methods: A 59-year-old homeless man with a history of long-term alcohol use was brought to the emergency department with transient unresponsiveness and impaired speech. Initial evaluation revealed hyponatremia, elevated CRP, leukopenia, and bilateral lower-lobe pneumonia. After treatment for pneumonia, patient was transferred to palliative care because he lacked a caregiver, safe housing, or cognitive capacity for self-care. Neurological examination demonstrated findings were consistent with Wernicke encephalopathy, and high-dose thiamine therapy was initiated, alongside nutritional support. Psychiatry noted fluctuating orientation, episodic hallucinations, and suspected alcohol-related neurocognitive disorder but no indication for inpatient psychiatric admission. Social services indicated that institutional placement required a medical board report and that Turkey lacks a structured, rapidly functioning adult guardianship system. Despite medical stabilization, the patient's prolonged hospitalization solely due to lack of social support represents a violation of principles of equity and fair access to healthcare.

Discussion: This case demonstrates how homelessness, cognitive impairment, and fragmented social support structures can transform medical problems into prolonged and preventable hospitalizations. International guidelines emphasize that palliative care addresses psychosocial and social suffering alongside physical distress. However Turkey lacks an efficient mechanism for placing non-terminal adults who require protective and custodial social care. In this context, the palliative care team became a “last safety net,” underscoring the ethical responsibility and solidarity shown by healthcare professionals.

Conclusion: Strengthening community-based services, developing adult guardianship mechanisms, and ensuring that vulnerable individuals have the freedom and opportunity to access safe housing and long-term care are essential for humanistic and to uphold dignity in primary care.

ID 1076- Health and illness on the streets: navigating between formal healthcare and personal survival strategies

Sandra LEÓN-HERRERA [(1)] , Carmen VICENTE-GARCÍA [(1)], Claudia TOMEY-GUILLÉN [(2)], Ángela Cristina ASENSIO-MARTÍNEZ [(1)], Mª Pilar RODRÍGUEZ-PÉREZ [(3)], Laura ALCONCHEL-VALERO [(4)], Marta DOMINGUEZ-GARCÇIA [(5)], Diana GARCÍA-MOSQUERA [(6)], Linx ALEXANDER-ARANGO

(1) Department Of Psychology And Sociology, University Of Zaragoza, Zaragoza, Espagne
(2) Hijas De La Caridad De San Vicente De Paúl, Zaragoza, Espagne
(3) Department Of Physiotherapy, Occupational Therapy, Rehabilitation And Physical Medicine At Rey Juan Carlos University, Madrid, Espagne
(4) Government Of Aragon, Zaragoza, Espagne
(5) Aragonese Health Service, Zaragoza, Espagne
(6) Fundación El Tranvía, Zaragoza, Espagne
(7) Aragonese Primary Care Research Group – Aragon Health Research Institute, Zaragoza, Espagne

Context: People experiencing homelessness often face substantial barriers to accessing formal healthcare. Mistrust, previous negative encounters, and daily survival demands shape how they perceive and use medical care. Many alternate between the official health system and personal strategies—such as traditional remedies or spiritual resources—to manage physical and mental health.

Objectives: To explore how people living on the streets understand health and illness, how they relate to formal healthcare, and what alternative strategies they use to cope with symptoms. A secondary objective is to compare the experiences of those who trust and regularly use medical services with those who avoid or reject them.

Methods: This qualitative study forms part of a broader mixed-methods project on homelessness trajectories. We are conducting semi-structured interviews with adults currently experiencing homelessness or recently living on the streets. Data are being analysed thematically using inductive coding. Special attention is paid to narratives about healthcare interactions—such as perceptions of overmedication or lack of understanding—and to descriptions of personal survival strategies (traditional remedies, spiritual support, peer networks). Ethical approval was granted by the Comité de Ética de la Investigación de Aragón (CEICA).

Results: Preliminary analysis reveals two contrasting patterns: (1) Participants who trust the medical system report relief in receiving structured care, while also noting fragmented follow-up and challenges adhering to treatment in unstable living conditions. (2) Participants who avoid formal care express stigma, fear of not being understood, and preference for culturally familiar practices or peer-supported strategies. Across both groups, ambivalence, emotional strain, and the need to prioritise daily survival strongly influence health behaviours. Full thematic findings will be presented at the conference.

Discussion: Early findings indicate that healthcare avoidance is not merely a personal choice but is shaped by traumatic past interactions, structural obstacles, and efforts to maintain autonomy. Understanding these perspectives is key for designing accessible, non-stigmatising, and flexible interventions tailored to people living on the streets.

Conclusion: This study highlights the coexistence of formal healthcare use and alternative survival strategies among people experiencing homelessness. These insights can inform community health programmes and support more inclusive, person-centred physical and mental healthcare.

Corresponding author: Sandra León-Herrera, tsandraocupacional@gmail.com

ID 1074- Barriers and facilitators in healthcare accessibility for street medicine patients in the Netherlands: a mixed-methods approach exploring professionals

Jeanine SUURMOND, Marieke VAN DIJK, Maria VAN DEN MUIJSENBERGH

Radboudumc, Nijmegen, Pays-Bas

Context: The homeless population in the Netherlands is growing. Homeless people experience more health problems and have a lower life expectancy compared to the general population. However, they encounter barriers in accessing healthcare services. Consequently, they make use of street medicine initiatives, rather than visiting a general practitioner.

Objectives: This study aims to gain insight into healthcare accessibility for the street medicine population in the Netherlands, with a focus on barriers and facilitators.

Methods: This study used a mixed-method explanatory sequential design, combining an online survey among Dutch street medicine professionals (N=33) with semi-structured interviews (N=6). Descriptive statistical analysis was conducted in SPSS; thematic analysis in ATLAS.ti.

Results: Most survey respondents perceived patient-related barriers (patients' behaviour (perceived by 91%), lack of health insurance (91%) and stable housing (85%)), as well as provider-related barriers (lack of knowledge (82%) and cooperation (76%)). Qualitative findings were structured around three barriers in (1) Person-centred care, (2) Competencies of care providers, and (3) Healthcare organisation. Low-threshold services, aligned with patients' contexts was identified as a key facilitator. Professionals' knowledge, attitudes, and skills could be enhanced through training. Professional networks and collaboration were also essential facilitators.

Discussion: The need for training for providers was emphasized. Regional variations in the provision and organisation of street medicine emerged, and literature supports these findings by advocating tailored approaches of care. Findings highlight the importance of equity-oriented policies and professional collaboration. Future research should include street medicine patient perspectives.

Conclusion: Healthcare accessibility for patients engaged in street medicine in the Netherlands is hindered by both patient- and provider-level barriers. Therefore, person-centred care, improvement of care providers' competencies, and stronger networks and collaboration are needed.

ID 586- "Salut Sense Barreres: Evaluation of a Community Project for integrating

Homeless individuals into Public Health Care

Mariona ISBERT PRADES, Laura OLIVA VIDAL, Ana RIU LLENA, Angela BLASI MARTINEZ, Maria Paz LOSCERTALES DE LA PUEBLA, Marcelo COVELO CURRAS, Agustin GARRIDO GORRIA, Irene MATEOS CONDE, Marina FAUQUED BAUSELLS, Sergi MORENO LARA

Cap Raval Nord, Barcelona, Espagne

Context: People experiencing homelessness face major obstacles to healthcare access, often relying on emergency services instead of primary care and resulting in poorer health outcomes. The community project “Salut Sense Barreres” (Health without Barriers) was launched by a primary care centre located on a catalan neighbourhood with high deprivation rates in coordination with a Social Gym acting as a reference community agent for homeless people. This project established a weekly administrative and health care point in the social Gym to bring this population closer to the public health care system.

Objectives: To evaluate the impact of the project "Salut Sense Barreres" in reducing barriers to health care access for homeless individuals in a deprivated district of a big city.

Methods: A descriptive study was conducted from February 2024 to January 2025, using weekly registers and health records for all homeless individuals attended during this period at the community point, with local ethics committee approval.

Results: A total of 322 users registered for the weekly advice point, of whom 266 people were included in the primary care electronic health record. At the end of the period, 10.53% obtained a definitive sanitary identification number. Primary care linkage with a doctor and nurse assigned was achieved for 18.42% in the intervention primary care centre and 28% to other primary care centers. Of the visits they made to the reference centre, 9.04% were to emergencies. This population accounted for 0.27% of total emergency visits. When a health professional was assigned, 64.19% of appointments were with them. The sociodemographic profile shows a male population (95.34%), with a mean age of 32.37 years, and mainly from Algeria (31.70) and Morocco (27.60%). Administratively, passport possession represents 53.40%.

Discussion: The outcomes are consistent with other studies showing that having health coverage diminishes emergency use.

Conclusion: This study shows that flexible, community-based healthcare delivered in trusted community spaces can reduce access barriers for people systematically excluded from the health system. This project proves to be a promising approach to strengthen engagement with primary care and promote more equitable access to essential health services.

Corresponding author: Mariona Isbert Prades, mer.isbert@gmail.com

ID 281- Impact of Directly Observed Treatment on Tuberculosis Case Outcomes: A Comparative Analysis Between the Homeless Population and the General Population

Fabio FRANCHI QUAGLIATO, Ulisses REIS, Isabella MARTINEZ, Renan MARTINS, Matheus MATOS, Soraya VARELLA, Lucila ANGELOTTI

Centro Universitário Barão De Mauá, Ribeirão Preto, Brésil

Context: Tuberculosis (TB) is a bacterial infectious disease that remains a major public health challenge in XXX due to its high incidence. The homeless population (HP) is approximately 56 times more likely to contract TB than the general population, indicating an association between social vulnerability and disease transmission. Directly Observed Therapy (DOT) is a strategy in which patients take their prescribed medication under the supervision of a health care professional. This approach aims to improve treatment adherence and reduce treatment default rates, particularly among vulnerable populations.

Objectives: This study aimed to comparatively assess the impact of DOT on disease outcomes among HP and the general population.

Methods: This is a quantitative, descriptive study, that used TB case notification data from XXX between 2015 and 2024, recorded in the National Disease Notification System (SINAN).The outcomes analyzed were treatment default, death due to TB, and drug-resistant TB (DR-TB) — collectively defined as unfavorable outcomes — and cure, defined as the favorable outcome. The comparison of DOT impacts on TB outcomes between HP and the general population was performed using the Mantel–Haenszel chi-square test.

Results: During the study period, 612,577 new TB cases with defined outcomes were reported nationwide, of which 11,621 were among HP; 5,614 of these individuals received DOT. After adjusting for differences in DOT implementation between HP and the general population, individuals who received DOT had 2.37-fold higher odds of cure compared with those who did not (Mantel–Haenszel Odds Ratio [ORMH] = 2.37; CI95% [ORMH] = [2.26–2.48]; $p < 0.001$). When analyzed separately, DOT was associated with 2.31-fold higher odds of cure in the general population, whereas among HP this effect was even greater, with 3.62-fold higher odds, indicating that the beneficial impact of the strategy is particularly pronounced in this vulnerable group.

Discussion: These findings corroborate existing evidence linking DOT to improved TB treatment outcomes, as the strategy enhances adherence to appropriate therapy.

Conclusion: Therefore, implementing DOT within Primary Health Care strengthens patient engagement with the health system and should be encouraged by public health authorities as an effective means of controlling TB progression.

ID 2300- Factors Influencing Late Diagnosis in People Living with HIV in Oman: An Ambidirectional Cohort Study, 1992–2024

Zainab Mahmood AL-ZADJALI

College Of Medicine And Health Sciences, Sultan Qaboos University,, Musca, Oman

Context: Despite advancements in the management of Human Immunodeficiency Virus (HIV), challenges remain in achieving early diagnosis, particularly in contexts with sociocultural and structural barriers.

Methods: This study examined factors associated with late diagnosis (LD) among people living with HIV (PLWH) in Oman from 1992 to 2024.

Originality: An ambidirectional cohort study was conducted at the National Referral HIV Hospital in Muscat (Royal Hospital, Ministry of Health), including HIV-positive adults aged ≥18 years with complete baseline CD4 count, viral load, and haemoglobin data. Informatio

Lessons learned and future implication: Of the 549 patients studied, 30.1% had a late diagnosis for treatment. Among late diagnoses, 72.1% were infected via sexual transmission, 64.8% were asymptomatic, and 52.5% had no comorbidities. Younger age groups had significantly higher adjusted relative

Discussion: This study identifies key factors influencing the timing of HIV diagnosis in Oman from 1992 to 2024, providing critical evidence to support data-driven decision-making. Late diagnosis was more prevalent among younger patients, those with disease stages 1 and 3, and those with cardiovascular comorbidities.

Conclusion: However, those with low haemoglobin were diagnosed early. These findings emphasize the need for enhanced early testing strategies, tailored clinical care, stigma reduction, and timely psychosocial interventions to improve outcomes and support Oman's 95-95-95 targets.

Integrated care

ID 1213- Why registration matters: general practitioners making a difference in healthcare for people with intellectual disabilities

Jip JANSEN

Radboudumc, Nijmegen, Pays-Bas

Context: A considerable proportion of the population (1-3%) lives with an intellectual disability (ID), based on their IQ (>70). In the Netherlands, the estimated prevalence is even higher, with around 1.1 million people (6.4% of the population) and includes borderline intellectual functioning (IQ 70-85) when combined with limitations in adaptive functioning. However, accurate numbers are lacking. General practitioners (GPs) provide important medical care for people with an ID, yet only about 20% of these patients are formally registered in GP records. No guidelines exist for this registration, although the International Classification of Primary Care (ICPC) code p85, 'mental retardation', is often used. While GPs are not required to register ID, doing so may facilitate better recognition of health needs and tailored care (longer consults, simplified communication). However, barriers exist: GPs may lack the knowledge to recognize ID, and stigma can discourage registration. Consequently, consultations may be too short or too complex, leaving patients without appropriate care. To develop recommendations for registration of ID in general practice, it is essential to understand perspectives and experiences of people with an ID and GPs on registration.

Objectives: To gain insight into the experiences and perceptions of GPs and people with an ID regarding the process of registering an ID in general practice.

Methods: A qualitative study explores perceptions and experiences of GPs and people with an ID on the process of registration an ID in general practice using focus groups. We aim to conduct three focus groups with GPs and five focus groups with people with a mild ID.

Results: At the time of the 30th WONCA Europe conference 2026 the focus groups will have ended and results will be presented. We will share the essential views of GPs and people with an ID on the registration of an ID in general practice.

Discussion: We will share and discuss obtained views of GPs and people with an ID on the registration of an ID in general practice.

Conclusion: Our insights will generate new knowledge and approaches to improve ID recognition and registration in primary care and contribute to improved health care and reduced health inequities for people with ID.

ID 1149- Equity through cultural safety: Primary-care adaptations for a high-risk Ashura ritual in a minority community.

Metehan GÜZELKAYA, Ismail ARSLAN, Duygu YENGIL TACI

Ankara Training And Research Hospital, Department Of Family Medicine, Ankara, Türkiye

Context: As a family physician serving a small Jaʿfari Shi'a minority community in Eastern Turkey, I work within a sociocultural setting where self-bloodletting during Ashura is a deeply meaningful expression of mourning, identity, and fraternity. Similar practices exist in other Shi'a populations globally. In our region, the ritual creates predictable periods of elevated exposure to blood-borne infections. In primary care—guided by principles of liberty, equity, and humanism—understanding such lived cultural realities is essential for equitable and culturally safe care.

Methods: During the ritual, I observed frequent sharing of blades, absence of sterilization, and rapid sequential blood contact—conditions forming a potential transmission chain for hepatitis B, hepatitis C, and HIV. Cultural norms of endurance, self-sacrifice, and lack of previous outbreaks appeared to normalize risk-taking and reduce preventive behavior. These sociocultural dynamics shaped engagement with health information and primary care services.

Originality: Although high-risk behaviors in minority groups have been studied, to our knowledge no work has examined this long-standing ritual specifically through a preventive primary-care perspective. Our ongoing research is one of the few field-based reflections f

Lessons learned and future implication: This experience prompted several practice adaptations: prioritizing hepatitis B vaccination and tetanus boosters; proactive screening of ritual participants, pregnant women, and newborns; pre-ritual counseling; and maintaining a non-judgmental environment

Discussion: Identifying this group as periodically high-risk supports more equitable preventive service allocation. Harm-reduction approaches proved more culturally aligned than prohibition-oriented messaging.

Conclusion: Our aim is not to restrict the ritual but to support safer participation by aligning cultural respect with evidence-based prevention, thereby strengthening trust, equity, and humanistic primary care.

ID 1123- The Role of Primary Care Physicians in Preventing Obesity and Diabetes: Challenges and Opportunities

Aidai SHARSHEKEEVA, Attila SARVARY

University Of Debrecen, Debrecen, Hongrie

Context: The escalating global epidemics of obesity and type 2 diabetes (T2DM) pose a severe threat to public health, with lower-middle-income countries like Kyrgyzstan facing a disproportionately high burden. Primary care is recognized as the crucial frontline for prevention, yet significant barriers often hinder its effectiveness in resource-limited settings.

Objectives: This study aimed to comprehensively assess the role, barriers, and opportunities related to obesity and diabetes prevention within the primary care system of Kyrgyzstan.

Methods: A qualitative, exploratory study based on grounded theory was conducted in 2025. Thirteen family physicians (12 female, 1 male) with a mix of urban and rural practices in Northern Kyrgyzstan were recruited. Data were collected via semi-structured interviews, which were transcribed, translated, and analyzed using axial coding to identify central categories and their relationships.

Results: The analysis identified a central issue: the ineffective prevention and management of obesity and diabetes. Several key themes emerged, including patient-related barriers, systemic obstacles, contextual challenges, a lack of institutional support, compensatory strategies, and negative consequences. This situation was primarily driven by several causal factors, including a critical shortage of specialists, such as endocrinologists and dietitians, financial barriers faced by patients, and low public awareness about these health issues. These challenges were further exacerbated by overwhelming physician workloads and deeply ingrained cultural dietary habits. In response to these pressures, physicians, constrained by a lack of government assistance and a patient mindset that often places health responsibility elsewhere, resorted to compensatory strategies. These included taking on extra duties and focusing health education efforts on younger, more receptive audiences. However, these measures ultimately resulted in late-stage diagnoses, physician burnout, and a continued failure of the preventive health system.

Discussion: Kyrgyzstan's primary care physicians are constrained by systemic and sociocultural barriers, resulting in a reactive care model unlike more integrated systems elsewhere.

Conclusion: There is an urgent need for systemic interventions to address specialist shortages, reduce physician workload by transferring competencies and involving other health specialists in primary health care, and implement supportive policies. Strengthening the primary care system is essential to unlock its preventive potential and curb the growing epidemic of obesity and diabetes in Kyrgyzstan.

ID 1029- Meeting the needs of patients with complex health and welfare problems: a focus group and interview study.

Vera TIEMES [(1)] , Peter LUCASSEN [(2)], Hanneke BORGDORFF [(1)], Stan VAN DE OORD [(3)], Rimke VOS [(1)], Mark VAN DER WEL [(2)]

(1) Department Of Public Health And Primary Care/ Health Campus The Hague, Leiden University Medical Centre, The Hague, Pays-Bas
(2) Radboud Institute Of Health Sciences, Department Of Primary And Community Care, Radboud University Nijmegen, Nijmegen, Pays-Bas
(3) Pro Persona Mental Health Care, Nijmegen, Pays-Bas

Context: Serious welfare problems can negatively impact health and create a complex mix of physical, mental and welfare problems. These problems are often persistent, and are associated with a lower quality of life and frequent healthcare utilisation. Policymakers and researchers are increasingly looking to integrated care as a solution for patients with problems on multiple life domains. However, there is little information on how these patients experience care and whether this meets their needs.

Objectives: To describe the characteristics, care experiences and views on optimal care among patients with multi-domain problems

Methods: Focus groups and individual (semi-structured) interviews were conducted with 'patients with multi-domain problems'. Participants had ≥1 chronic physical condition, ≥1 welfare issue, and frequent GP consultations.

Results: In total, 21 participated in the study. They described their situation as complex due to accumulating and interacting problems. Participants mentioned unmet basic needs, that they often felt were urgent. They mentioned trust issues, due to negative or traumatic experiences, and a tendency to withdraw from contact. They expressed that building a relationship with their care provider takes time, personal continuity and a supportive attitude. They underlined the need for coordinated and personalised care. Further issues were: need for assistance with practical issues and improving self-reliance.

Discussion: Participants' description of ideal care aligns with what patients in general value: relationship, continuity, feeling acknowledged and whole person care. Their trust issues trust may complicate building a trusting relationship. Feelings of urgency may not be shared by GP's and risk ad hoc consultations (hindering continuity). GP's should consider referring to case management for expertise on unmet basic needs and practical support, but steps are needed to prevent withdrawal from future care.

Conclusion: The care needs of patients with multi-domain problems are roughly similar to those of the general population. Fragile trust and feelings of urgency are distinctive characteristics that need attention of GPs.

ID 725- Published in BMC Medicine

Paul DOMENACH [(1)] , Alexandre MALMARTEL [(2)], Viet-Thi TRAN [(2)], Philippe RAVAUD [(2)], Karolin KRAUS [(2)]

(1) Université Lyon 1, Lyon ; Paris, France
(2) Université Paris Cité, Paris, France

Context: While patient-centered care and contextual adaptation are recognized as crucial for clinical practice, they are often overlooked in randomized controlled trials. Current personalized medicine studies focus almost exclusively on biological factors, mainly because precise markers describing patients' psychosocial and environmental factors are lacking.

Objectives: The objective of this study was to provide an initial set of psychosocial and contextual markers, derived from physicians' self-reported descriptions of real-world personalization situations.

Methods: An online questionnaire with one open-ended question, asking physicians to describe clinical situations in which they personalized care, was used. Physicians were recruited from March 31, 2023, to August 10, 2023, from three hospitals, five university departments of general practice and six physician organizations in France. Recruitment was

conducted through email invitations, with participants encouraged to invite their colleagues via a snowball sampling method. The analysis involved both manual and AI-assisted content analysis using GPT3.5-Turbo (OpenAI). Mathematical models to assess data saturation were used to ensure that a comprehensive list of markers was identified.

Results: In total, 1340 people connected to the survey platform and 1004 (75.0%) physicians were eligible for the study (median age 39 years old, IQR 34 to 50; 60.5% women; 67.0% working in outpatient settings; 65.2% were general practitioners), among whom 290 answered the open-ended question. The participants reported 317 clinical situations during which they personalized care. Personalization was based on the consideration of 40 markers: 27 were related to patients' psychosocial characteristics (e.g., patient capacity, psychological state, beliefs), and 13 were related to circumstances (e.g., competing activities, support network, living environment). The data saturation models showed that at least 97.0% of the potential markers were identified. Manual and AI-assisted content analysis using GPT3.5-Turbo were concordant for 89.9% of clinical situations.

Discussion: Afterwards, the effect of these markers on treatment engagement and effectiveness needs to be evaluated in clinical studies and integrated as tailoring variables in personalized interventions to build evidence-based personalization.

Conclusion: To our knowledge, this is the first list of fine-grained individuals' psychological, social, cultural, behavioral, and economic factors that may influence their response to treatment across a broad range of situations and diseases.

ID 152- Dog Companionship and Loneliness in Older Adults: A Multicentre, Cross-Sectional Study in Primary Care and Hospital Care

Eric POITRINE

Sorbonne Université, Paris, France

Context: Loneliness and social isolation are major public health concerns among older adults and are associated with depression, cognitive decline, frailty, and loss of independence. Companion animals (and dogs in particular) might mitigate these adverse outcomes by fostering emotional support, physical activity, and social interactions.

Objectives: The objective of the present study aimed to evaluate the association between dog ownership and loneliness in community-dwelling older adults.

Methods: C-KDOG is a multicentre, cross-sectional study conducted between September 2020 and April 2023 at seven investigating centres in France. The participants were aged 75 or over and were living at home. Loneliness was assessed on the 11-item De Jong Gierveld Loneliness Scale. The secondary outcomes included emotional and social loneliness subscores, social isolation (according to the Social Network Index), and the presence of falls and bites. Associations between dog ownership and loneliness were analyzed using multivariable linear regressions adjusted for sociodemographic, environmental and clinical characteristics.

Results: A total of 160 participants were included, of whom 47 were dog owners (mean age: 82 years; females: 116 (73%); living alone: 79 (49%)). The median overall loneliness scores did not differ significantly when comparing dog owners and non-owners. In adjusted models, however, dog ownership was independently associated with lower loneliness. This association was mainly driven by a lower emotional loneliness subscore. Living alone, frailty, depressive symptoms, and sleep problems were independently associated with a greater level of loneliness. Dog ownership was primarily motivated by companionship (81%). Adverse events (falls or bites) were rare (5%).

Discussion: This study had strengths: the analysis of the patients' clinical and sociodemographic characteristics in depth; the distinction between loneliness and social isolation and the characterization of respondents motivations for owning a dog or not. The limitations were a study design that prevents the assessment of causal

relationships; a relatively small sample size and the fact that the study was conducted during the COVID-19 pandemic, which may have altered how loneliness and social isolation were reported.

Conclusion: Dog ownership was associated with a lower level of emotional loneliness among community-dwelling older adults, independently of frailty and depression. Companion dogs might contribute to emotional well-being in older adults.

ID 33- Helping Patients Think Critically: A Primary Care Approach to Assessing Health Claims

Vineet NAIR

Shulich School Of Medicine & Dentistry At Western University, London, Canada

Context: Family doctors are increasingly asked to comment on a wide range of treatments—prescription medications, supplements, and natural/alternative remedies. Patients want to know: Does it work? Is it safe? Should I try it? In an environment saturated with marketing, testimonials, and conflicting opinions, both patients and clinicians need a consistent, practical way to evaluate these claims together.

Methods: This presentation outlines a four-question framework developed from everyday clinical practice to guide evidence-informed, patient-centred decision-making. The framework can be applied to any health intervention—traditional or otherwise—by systematically asking: 1. What are the benefits? 2. What are the harms? 3. What are the costs? 4. How convenient is it? Each step will be further outlined and supported by examples drawn from real-world consultations. The process integrates shared decision-making, critical thinking, and basic principles of evidence evaluation to create a repeatable approach for clinical encounters.

Originality: This framework bridges the gap between scientific evidence and everyday practice. It emphasizes reasoning over reaction—helping both clinicians and patients move beyond emotion, anecdote, or marketing toward logic, context, and values. It is quick, conver

Lessons learned and future implication: Applying this model can lead to clearer patient understanding, greater confidence in clinical recommendations, and more collaborative decision-making. It helps clinicians do this process with confidence and clarity. Patients can then make their choice bas

Discussion: Given the myriad of decisions family physicans have to make alongside their patients, it is imperative that we have a structured and practical framework with which to have those discussions. The framework outlined provides that structure to handle any conversation around treatment and medication options.These discussions can strengthen trust, improve patient autonomy, and safeguard against misinformation—without requiring extra time or complex tools.

Conclusion: This practical four-question framework empowers clinicians and patients alike to evaluate any treatment - traditional or modern - using common sense, clarity, and compassion which are the core of family medicine.

It takes a village: interprofessional community care

ID 1973- Ecology of medical and non-medical care: Model has changed!

Julie DUPOUY [(1)], Catherine LAPORTE [(2)] , Aurore PALMARO [(1)], Tiphanie BOUCHEZ [(3)]

(1) Département Universitaire De Médecine Générale, Ufr Santé, Université De Toulouse, Toulouse, France
(2) Département Médecine Générale Clermont Ferrand, Clermont Ferrand, France
(3) Département Médecine Générale Nice, Nice, France

Context: In 1961, White described patterns of access to healthcare in the United States, showing that most health problems were managed in primary care, with fewer patients accessing secondary or tertiary services. Subsequent studies have demonstrated the stability and broad

applicability of this ecology of care model. The increasing complexity of health needs, and the demographic evolution of human resources have led to the evolution of care models. Collaborative health practices have been promoted and strengthened.

Objectives: The present study aims to extend this framework in France by incorporating reimbursed care delivered by non-physician professionals, in order to better reflect patients' contacts with health system.

Methods: We conducted a nationwide, population-based, cross-sectional study using data from the French National Health Data System (SNDS). The SNDS covers about 99% of the French population and contains longitudinal records of all primary and secondary care reimbursed health expenses. Following White's medical ecology framework, healthcare use was measured as the number of beneficiaries per 1,000 persons with at least one reimbursement ("contact") in a given month. All individuals covered by the database in 2018 were included.

Results: In 2018, the monthly number of contacts with ambulatory care were 231 per 1,000 persons with ambulatory general practitioners, 77 per 1,000 persons with other ambulatory specialists, 72 per 1,000 persons with dentists and 5 per 1,000 persons with midwives. The monthly numbers of other contacts in primary care were reprensented by: 61 per 1,000 persons with nurses, 56 per 1,000 persons with physiotherapists, 10 per 1,000 persons with speech therapists. The monthly number of hospital contacts per 1,000 persons was 36 with hospital specialists, and 11 for hospitalizations.

Discussion: Non-physician professionals contribute significantly to healthcare use in France. Their inclusion in the ecology of care framework provides a more comprehensive view of patient pathways and highlights the multidisciplinary nature of healthcare delivery. Ongoing analyses stratified by age and sex will provide additional insights on this model.

Conclusion: Integrating reimbursed care from non-physician professionals enhances the understanding of healthcare use in France. This expanded ecology of care underscores the importance of interprofessional primary care and offers relevant insights for health policy and planning.

ID 2016- The value of casemanagement in the treatment of patients with post-COVID

Marcia SPOELDER, Henk.Schers@Radboudumc.NI SCHERS, Leon VAN GROENENDAEL, Karolina ANDRALOJC, Ryan VAN BAAL, Miriam DOHMEN

Radboudumc, Nijmegen, Pays-Bas

Context: Patients with complex post-COVID issues were referred by their general practitioner to a post-COVID carepath of 6 months in the Nijmegen region within the Netlherlands (2022-2024). The core component was a regionally operating casemanager. This individual: 1) provides recognition and explanation, 2) coordinates and organizes care, and 3) fosters interdisciplinary collaboration within the care network.

Objectives: This study evaluated the long-term impact of post-COVID carepath with the involvement of a casemanager.

Methods: This mixed-methods study evaluated quantitatively symptomatology, cognition, daily functioning, quality of life, and coping with symptoms at baseline and after 3 and 6 months for 193 patients. After 2 years (n=82 patients), we repeated questionnaires and added questions on post-exertional malaise (PEM), orthostatic intolerance (OI), healthcare utilization, and informal caregiving. We used the systematic and reflexive interviewing and reporting (SRIR) method for collecting, organizing, coding, and analyzing qualitative data. We interviewed 18 patients, 3 casemanagers, and 15 professionals.

Results: Casemanagers referred most often to two or three allied healthcare professionals, most often to occcupational therapy (85%) and physiotherapy (61%). The total time spent on 6 months casemanagement is 321 minutes per patient. Patient satisfaction was high with 8.3 (1-10). After 6 months, symptoms have decreased, functioning in household and social contacts has improved, and the denial, resistance, and sadness regarding the

illness have decreased. The 2-year follow-up measurement shows a mixed picture; some symptoms continue to decrease, while others remain stable or worsen. Patients with PEM (66%) and OI (36%) exhibit more severe symptomatology and worsen without care pathway guidance. The integrated thematic analyses of the interviews revealed four overarching domains: 1. Patient navigation and empowerment 2. Coordination and continuity of care within the care path 3. Communication and interprofessional collaboration 4. Core attributes and competencies of post-COVID case managers.

Discussion: Care for patients with PEM and OI requires a different approach than for patients without these conditions.

Conclusion: The patient group experiences severe health issues for which long-term recognition, acknowledgment, support, guidance, and treatment are necessary. The case manager relieves the general practitioner, medical specialists, and family by taking charge to ensure that the appropriate care is provided.

ID 1690- Interprofessional Collaboration in Primary Health Care: Orientations of Co-operation and Perceived Development Needs among Primary Care Physicians in Finland

Henna SAARI, Anna MIETTINEN, Ulla MIKKONEN, Nina TUSA, Pekka MÄNTYSELKÄ, Kadri SUIJA

University Of Eastern Finland, Kuopio, Finlande

Context: In Finland, primary care facilities typically host co-located multidisciplinary health professionals, enabling interprofessional collaboration (IPC) to support coordinated service delivery. More knowledge is needed on physicians' perspectives on its effectiveness and areas for improvement.

Objectives: This study aimed to explore primary care physicians' (PCPs) perceptions of current IPC practices and identify opportunities for improvement to advance collaborative care.

Methods: A qualitative descriptive approach was adopted, involving PCPs from both urban and rural primary health care (PHC) units across all Finnish wellbeing services counties. Data were gathered through a nationwide online survey. Responses to two open-ended questions were analyzed using inductive thematic analysis, guided by conceptual orientations of interprofessional work.

Results: A total of 270 PCPs participated. Two overarching themes derived regarding existing practices: (1) Factors sustaining chain-like IPC, marked by structural limitations and conventional role-based practices; and (2) Factors enabling shared knowledge creation, encompassing structural supports such as collaborative environments, model-based approaches, and team structures, alongside attitudes and values promoting communication and joint learning. Development needs highlighted by participants included stronger leadership for collaboration, improved work environments and culture, structured models, and communication strategies.

Discussion: The study identified two distinct orientations of IPC: a traditional model, shaped by structural constraints, and a shared-knowledge model, supported by collaborative environments.

Conclusion: Improved IPC requires stronger leadership, supportive work settings, and structured models. Future research should investigate IPC orientations in relation to patient experiences and roles, and interactions with other professionals.

ID 937- Listening to the community: a qualitative study of health mediation needs to inform primary care programmes

Karolina GRIFFITHS [(1)] , Agnes OUDE ENGBERINK [(2)], Agathe FERRATO [(2)]

(1) Département Universitaire De Médecine Générale. Faculté De Médecine De Montpellier-Nîmes; Maison De

Santé Pluridisciplinaire Montpellier Cevennes, Montpellier, France
(2) Département Universitaire De Médecine Générale. Faculté De Médecine De Montpellier-Nîmes, Montpellier, France

Context: Across Europe, social inequities in health continue to hinder access to care, particularly in socioeconomically deprived neighbourhoods. General practitioners (GPs) frequently encounter patients facing administrative hurdles, fragmented services and low health literacy. Health mediation and social prescribing are increasingly promoted as solutions to bridge medical and social needs and strengthen patient autonomy. However, programme design is often top-down, and little is known about what communities themselves identify as their most important needs. Despite the expansion of health mediation initiatives and additional roles in primary care such as link workers, few studies have explored these needs from the perspective of residents living in deprived neighbourhoods. To address this gap, a qualitative study was implemented in a priority urban neighbourhood.

Objectives: To explore, from a community perspective, the health mediation needs of residents in a French priority urban neighbourhood, with the aim of informing the design of primary care and social prescribing programmes.

Methods: We conducted a qualitative phenomenological study using semi-structured interviews with adult residents. Purposive sampling ensured diversity in language, social situation and healthcare use. Interviews explored lived experiences of accessing care, perceived obstacles, expectations of health mediation and preferred forms of support. Data were analysed thematically until saturation.

Results: Ten interviews were conducted, reflecting a wide range of social and linguistic backgrounds. Participants described significant difficulties with administrative procedures, care navigation and communication with healthcare services. Five community-defined priorities emerged: - simplifying administrative processes through a clear medico-social interface; - supporting navigation and understanding of care pathways; - increasing professionals' awareness of the impact of social vulnerability on care; - promoting empowerment by valuing patient experience and reducing stigma; - developing accessible health promotion activities, particularly for mental health.

Discussion: These findings highlight the importance of designing mediation and social prescribing programmes grounded in the lived experiences of the populations they serve, rather than solely on professional or institutional perspectives.

Conclusion: A community-driven approach is essential to improving access, autonomy and continuity of care in deprived areas. Integrating health mediators sustainably into primary care requires long-term funding and programmes that are shaped directly by residents' expressed needs.

ID 267- Management Strategy for Statin Intolerance: Feasibility of N-of-1 tests in Primary Care Teams

Laurent BRUTUS [(1)] , Amélie BLERVAQUE [(1)], Thierry BUCLIN [(2)], Léonore DIEZI [(2)]

(1) Msp Pôle De Santé Du Marais, Sallertaine, France
(2) Centre Hospitalier Universitaire Vaudois, Lausanne, Suisse

Context: Statin intolerance, whether real or perceived, is common in primary care practice. These patients face the choice of either discontinuing treatment and thereby increasing their cardiovascular risk, or taking a less effective substitute (fibrates or ezetimibe monotherapy) or a much more expensive alternative (anti-PCSK9 antibodies). Since they anticipate adverse effects when considering resuming statin therapy, rechallenging statin therapy is likely to fail. By contrast, a blinded N-of-1 test approach is likely to circumvent this cognitive bias. An N-of-1 test is a double-blinded multiple crossover clinical trial run in a single patient, in which random allocation determines sequences of active treatment and control periods.

Methods: Four patients at high cardiovascular risk who had discontinued their statin treatment were offered an N-of-1 test between 2021 and 2024 to compare the tolerability of a statin with either a placebo or an active comparator (ezetimibe or fenofibrate). Placebo was chosen in two patients not taking any lipid-lowering treatment before the

test. Each patient gave their consent for the test. The dispensing pharmacist, duly informed, prepared identical capsules containing either the statin or the comparator and randomly assigned treatment sequences in blocks of two. Each test consisted of six 21-day treatment periods alternating simvastatin and placebo, or 28-day treatment periods alternating simvastatin and the active comparator. Patients assessed their tolerance daily using visual analogue scales for muscle pain. At the end of the test, after unblinding, the results were graphed and analysed with the patients.

Originality: By combining treatment individualisation with patient engagement, the N-of-1 approach could transform primary care practice in situations of uncertainty.

Lessons learned and future implication: All four patients completed their tests, filling in 88% to 99% of the daily pain scales. After test completion, they all rated their pain as moderate and unrelated to statins, and subsequently resumed statin therapy, which they continue until now. Patient

Discussion: The same approach has been used successfully in the UK in two recent randomised placebo-controlled trials using an N-of-1 approach and designed to assess statin tolerance and nocebo effects.

Conclusion: Our experience proves that conducting N-of-1 tests is feasible in primary care teams.

ID 303- Effectiveness of a multidisciplinary community intervention in patients with fibromyalgia: a quasi-experimental trial with pre and post-intervention evaluation.

Vicente José GAVARA PALOMAR, Celia María FERNÁNDEZ MARTÍNEZ, Carmen MATRÁN MORENO, Celia NAVARRO ALTAMIRANO, Anna PROSALOVA TITOVA, Laura GUTIERREZ CORTÉS, José Miguel BORRACHERO GUIJARRO, Olga ROS BAS, María José DELGADO RODRÍGUEZ, José Ramón LORCA SERRA

Primary Care Health Center Isaac Peral, Cartagena, Espagne

Context: In our primary care team,within the context of social and healthcare interventions in our health area,we have identified a need to improve care for our patients with fibromyalgia syndrome,and therefore we have decided to implement a multidisciplinary educational intervention.

Objectives: Main objetive:To evaluate the impact of a multidisciplinary educational intervention in fibromyalgia patients in a health district on their perception of quality of life and disease control, their symptoms of depression and anxiety, their perception of pain, and their use of healthcare resources. Specific

Objectives: -To analyze changes in patients' quality of life before and after the intervention using the FIQ-R questionnaire. -To evaluate the evolution of anxiety and depression symptoms using the HADS scale. -To measure changes in catastrophic thinking related to pain using the PCS scale. -To describe the change in the use of healthcare resources (number of medical and nursing visits) after the intervention. -To characterize the sociodemographic and clinical profile of the participants (age, sex, educational level, comorbidities, years since diagnosis, pharmacological treatment).

Methods: -Study Design:a prospective, longitudinal, quasi-experimental (before-after) analytical study. -Study Setting:urban Primary Care Health Center -Duration:eleven months. -Target Population:adults diagnosed with fibromyalgia and receiving routine follow-up in primary care. -Inclusion Criteria:oPatients diagnosed with fibromyalgia according to ACR criteria. oAge between 18 and 80 years and receiving routine follow-up at the Health Center. oSigned informed consent. -Exclusion Criteria:oSevere cognitive impairment. oUncontrolled psychiatric comorbidity. oSevere communication difficulties. -Sample size and power plan Given the project nature and the uncertainty regarding the achievable sample size (n), the study is planned with a minimum operational sample size of 30 participants as a pilot simple with confidence level $\alpha=0.05$ and power 80–90% (bilateral),considering pre–post correlation. -

Intervention Description:The community education program for fibromyalgia consists of nine monthly group sessions,each lasting approximately two hours. It is designed using a multidisciplinary approach and includes the participation of healthcare and social work professionals,as well as the Afibrocar Association.

Results: We are currently performing the intervention, results discussion and conclusion will be able by the time of the conference

Discussion: Will be able by the time of the conference

Conclusion: Will be able by the time of the conference

ID 2116- The Changing Correlation Between HbA1c and Fasting Plasma Glucose Across Stages of Chronic Kidney Disease in People with Type 2 Diabetes with and without Anemia

Galia ZACAY [(1)] , Neora ALTERMAN [(2)], Noga FALLACH [(2)], Victor GROSS [(2)], Gabriel CHODICK [(3)], Anthony HEYMANN [(1)]

(1) Meuhedet Health Services, Gray Faculty Of Medical & Health Sciences Tel Aviv University, Tel Aviv, Israël
(2) Meuhedet Health Services, Tel Aviv, Israël
(3) Gray Faculty Of Medical & Health Sciences Tel Aviv University, Tel Aviv, Israël

Context: HbA1c is widely used to monitor long-term glycemic control and predict complications in patients with diabetes. However, its reliability is reduced in Chronic Kidney Disease (CKD), where factors such as anemia alter the relationship between glycation and actual glucose exposure. As CKD progresses, HbA1c levels may be falsely decreased, weakening their correlation with fasting glucose. Because clinical guidelines often rely on specific HbA1c thresholds, these inaccuracies may contribute to suboptimal medication management, treatment delays, and increased risk of complications.

Objectives: To characterize how the correlation between fasting plasma glucose and HbA1c changes across CKD stages in patients with and without anemia.

Methods: We conducted a cross-sectional study using medical records from a large health maintenance organization, including all adults with type 2 diabetes. CKD stage was defined by estimated glomerular filtration rate (eGFR). Anemia was defined as hemoglobin <12 g/dL in women and <13 g/dL in men. Linear regression models and Pearson correlation coefficients were used to assess the relationship between fasting glucose and HbA1c across CKD stages, stratified by anemia status.

Results: The study included 69,200 adults with diabetes, of whom 18.0% had eGFR <60 mL/min/1.73m². Among patients with eGFR ≥60 and no anemia, HbA1c increased by 0.023 percentage points for each 1 mg/dL increase in fasting glucose. This slope decreased to 0.020 for those with eGFR 45–59 without anemia, 0.018 for those with anemia, and 0.011 for patients with eGFR <15. Correlation between fasting glucose and HbA1c was high in patients with eGFR ≥60 (R=0.71, CI 0.70–0.71) and declined with worsening CKD and anemia: R=0.64 (CI 0.62–0.65) and R=0.57 (CI 0.24–0.60) for eGFR 45–59 without and with anemia, respectively, and R=0.54 (CI 0.47–0.61) for eGFR <15.

Discussion: The relationship between fasting glucose and HbA1c weakens progressively with declining kidney function, particularly in the presence of anemia. These findings reflect physiological changes in CKD, including shortened red-cell lifespan, that contribute to falsely low HbA1c values.

Conclusion: HbA1c is less reliable as kidney function declines, and anemia further reduces its accuracy. Clinicians should interpret HbA1c cautiously in CKD and consider complementary markers to avoid undertreatment and prevent complications.

ID 1875- Infectious disease test regulation- Is it feasible? Is it effective?

Ian MISKIN

Clalit Health Services, Jerusalem, Israël

Context: There is a vast spectrum of tests for infectious diseases [ID]- sample cultures, sample PCR, PCR of blood and multiple seroloical tests. Today almost all ID testing can be performed in the community- blood samples, swabs for culture and PCR- then performed in community-, hospital- or specialist laboratories. The number of tests available requires a broad knowledge of ID to determine which tests to perform for a specific patient, and which results are prerequisites for advanced testing. There are various ways to improve the relevance of tests sent such as preauthorisation by electronic medical record [EMR] or by email or phone or authorisation after the sample arrives at the testing site. We have been authorising 31 ID tests for over 10 years, determined by cost of test and by overuse. We describe the results of this programme and the relevance for other primary care health systems

Methods: In 2015 we constructed a list of tests which were often found to be nonrelevant. As our EMR is not able to perform preauthorisation, we informed all physicians of the tests included and that a decision whether or not to perform the tests would made after the sample reached the laboratory. This was in order not to increase physician workload and to enable central control at the level of the district laboratory. In all cases of tests not performed, the sending physician was informed by email, together with the reasoning.

Originality: We are the only district in our HMO limiting tests in this way, the objective being not only to improve accuracy but also to educate community physicians.

Lessons learned and future implication: Over 2021-2024 around 42% of the ID tests sent were approved, with a saving of 60% in costs. Our rate of ID testing was merely a third of the country rate.

Discussion: Costs saved by direct regulation were only a quarter of all savings- the remainder stemmed fron the Hawthorne effect. The regulation required a single ID physician and two part time lab administrative staff. Annual savings amounted to $3 per patient for 500,000 patients.

Conclusion: ID testing can be made more focused, saving costs and improving physician capability

ID 1694- Translating guidelines into practice: Implementation of NT-proBNP testing for early heart failure detection in diabetes

Jonathan DOS SANTOS [(1)] , Ana CEBRIÁN [(2)], Gabriella BOBBA [(3)], Gesine MEYER [(4)], Danica Rotar PAVLIČ [(5)]

(1) Department Of Medical Sciences, University Of Aveiro, Aveiro, Portugal
(2) Primary Care Center Cartagena Casco, Murcia, Espagne
(3) Roche Diagnostics International Ltd., Rotkreuz, Suisse
(4) Verein Swissdocs.net, Hutwil, Suisse
(5) Department Of Family Medicine, Faculty Of Medicine, University Of Ljubljana, Ljubljana, Slovénie

Context: Diabetes is strongly correlated with heart failure (HF), and early identification of asymptomatic HF (Stage B) can improve outcomes. The American Diabetes Association (ADA) recommends measuring N-terminal pro B-type natriuretic peptide (NT-proBNP) for early diagnosis of HF in people with diabetes. However, achieving universal adoption remains a challenge in clinical practice.

Methods: A multinational group of primary care, cardiology and endocrinology experts convened to reflect on practical recommendations for implementing the ADA guidelines on a national level. Key parameters for implementation were considered: the patient pathway, resource availability, NT-proBNP thresholds, educational needs of clinicians, and cost implications. The primary finding was the necessity of local tailoring to manage the potential strain on general practitioners and specialist cardiology services. Proposed strategies included: prioritizing high-risk patient phenotypes as the target population (e.g., based on age and existing comorbidities), adopting risk-stratified NT-proBNP thresholds, leveraging digital tools and education led by specialists to

enable easier result interpretation and guidance on further actions.

Originality: This work is innovative as it synthesizes and compares diverse practical experiences from ten countries, showing how multiple nations adapted the ADA guideline to their unique local healthcare systems. It confirms that implementation of NT-proBNP testing

Lessons learned and future implication: The collective experience confirms that a multipronged approach is essential for sustainable early HF detection. Crucially, economic analyses consistently show that NT-proBNP-guided management is cost-effective globally, primarily driven by the reduction

Discussion: This collective reflection provides actionable models for general practitioners, supported by cardiologists and endocrinologists, to implement early HF detection programs in their local settings.

Conclusion: Effective integration of NT-proBNP testing relies on establishing clear, financially supported, multidisciplinary pathways that balance global guideline directives with national resource capacity and clinical complexity.

ID 867- Implementation of C-reactive Protein Point-of-Care Testing in Primary Care

Sara RODOREDA, Elisabet DESCALS, Ana Maria ANDRÉS, Maria Antonia LLOPIS, Leonardo MÉNDEZ, Ana María RIOS, Gemma Rosa RICÓS, Gemma CALVET, Cinta Elvira ESTRADA

Catalan Health Institute, Barcelona, Espagne

Context: Inappropriate antibiotic prescribing for mild acute respiratory infections (ARIs) contributes to bacterial resistance. In Primary Care, clinical assessment alone often does not allow clinicians to differentiate reliably between viral and bacterial infections. C-reactive protein (CRP) point-of-care testing (POCT) provides rapid capillary blood analysis (under 10 minutes) and may support more accurate decision-making. The main public Primary Care provider in Catalonia implemented CRP POCT across selected adult and paediatric centres to improve ARI management.

Methods: A multidisciplinary steering group was established to plan the implementation and anticipate operational challenges. The strategy accounted for the seasonal increase in ARIs, aiming to guarantee full functionality before late autumn. Key actions included procurement of 110 CRP POCT devices, identification of territorial leads to support rollout, development of clinical algorithms incorporating CRP measurement when diagnostic uncertainty exists, distribution of devices to pilot centres, and structured training for local leads and healthcare teams. Following deployment, pilot centres began routine use of CRP POCT, with a final evaluation phase planned.

Originality: This initiative represents a large-scale, system-wide introduction of CRP POCT within a regional Primary Care network. Although CRP POCT is well established in other countries, its coordinated integration into clinical pathways, combined with organization

Lessons learned and future implication: Successful implementation required close collaboration across clinical, managerial and technical teams, highlighting the importance of structured change-management strategies. CRP POCT has the potential to enhance diagnostic accuracy, guide antibiotic pre

Discussion: Early implementation suggests that structured planning, territorial leadership and clear clinical pathways are essential for integrating POCT technologies into routine Primary Care workflows.

Conclusion: This project may become an effective and scalable model for improving ARI management, promoting rational antibiotic use, and strengthening resolution capacity in Primary Care.

ID 610- Revisiting the Dexamethasone Suppression Test: A Stepwise Approach for Primary Care Assessment

Ting Lun WANG, Yi-Ju CHEN

Department Of Family Medicine, Taipei City Hospital Yangming Branch, Taipei, Taïwan, République de Chine

Context: The low-dose dexamethasone suppression test (DST) is widely used in primary care for screening endogenous Cushing's syndrome, yet interpretation in daily practice remains challenging. Acute illness, metabolic disturbances, and individual hypothalamic–pituitary–adrenal (HPA) variability may generate borderline or inconsistent cortisol levels, complicating clinical decision-making regarding further evaluation.

Methods: A 71-year-old woman with poorly controlled type 2 DM was hospitalized for urinary tract infection. Laboratory tests revealed markedly elevated ACTH (125 pg/mL) and cortisol (60 µg/dL) despite the absence of cushingoid appearance on physical examination. An in-hospital overnight low-dose DST showed absent suppression (33.2 µg/dL), and pituitary MRI revealed normal size without focal lesion. After clinical stabilization, a repeated DST demonstrated equivocal suppression (1.92 µg/dL). During follow-up, her metabolic profile remained variable, but no clear evidence of overt hypercortisolism emerged.

Originality: This case illustrates a diagnostic challenge in which repeated DSTs remained inconclusive despite the absence of a pituitary lesion. It highlights how borderline suppression patterns and the timing of testing can complicate interpretation.

Lessons learned and future implication: DST should ideally be performed when the clinical condition has stabilized to avoid misleading results. The equivocal suppression after recovery shows that abnormal findings obtained during acute illness might require confirmation rather than immediate in

Discussion: Equivocal DST results can create uncertainty in routine practice, especially when laboratory values are not clearly interpretable or change over time. Using longitudinal assessment and focused follow-up testing can help clinicians better understand these borderline findings and avoid unnecessary escalation of care.

Conclusion: A structured, context-based approach supports more reliable interpretation of DST results and promotes more efficient use of healthcare resources in primary care.

Corresponding author: Ting Lun Wang, mercenary59137@gmail.com

ID 358- Implementation of glycated hemoglobin measurement through point of care as a parameter of glycemic control

Juan Carlos TOMAS LÓEZ, Eugenia Del Rocio RIVERA TELLO, Hector Raul VARGAS SANCHEZ, Elizabeth GUZMAN MEDINA, Hortensia VEGA VEGA, Luisa Estela GIL VELAZQUEZ, Claudia Maria CARBAJAL GARCIA, Rafael PEREZ VILLEGAS

Mexican Social Security Institute, Mexico, Mexique

Context: Managing diabetes solely through blood glucose levels is insufficient to reduce morbidity and mortality caused by the disease. The Mexican Social Security Institute (IMSS) has 5.3 million people diagnosed with diabetes, and for years, Glycosylated hemoglobin (HbA1c) testing was not available at the primary care level. In recent years, the use of HbA1c has been promoted as part of the assessment of glycemic control in people living with diabetes.

Methods: In 2024, the IMSS conducted a pilot program to increase the use of Glycosylated hemoglobin testing at the primary care level. This program was implemented in 35 Family Medicine Units across three Mexican states (Coahuila, Jalisco, and Veracruz), which lack nearby access to laboratories. These units were provided with point-of-care equipment and cartridges for rapid HbA1c testing. Field visits were conducted (January-March), and training was provided to healthcare team personnel.

Originality: From January to June 2024, 19,783 rapid HbA1c tests were performed in the 35 medical units, with an initial average HbA1c of 8.1. Medical staff made therapeutic adjustments in cases where

patients were not within the target range. At the end of the pilot

Lessons learned and future implication: Laboratory tests are necessary for all individuals to accurately assess patients' metabolic control. Plans are underway to make portable equipment for rapid glycated hemoglobin testing available to healthcare providers and patients.

Discussion: Having rapid glycosylated hemoglobin tests would be beneficial for clinical decision-making to improve the management of diabetes in people living with the disease, specially en family medicine units far away or without laboratory

Conclusion: Given the lack of access to laboratory services and HbA1c testing in Family Medicine Units (UMF), having a point-of-care device for rapid HbA1c determination can facilitate therapeutic adjustments by physicians to improve diabetes control.

Corresponding author: Juan Carlos Tomas Lóez, tomljc80@yahoo.com.mx

ID 164- Is Erythrocyte Sedimentation Rate Still Relevant in General Practice? A Systematic Review of the Literature

Aurélien FALCON, Angélique SAVALL

Ujm, Saint Etienne, France

Context: In 2024, more than 15 million erythrocyte sedimentation rate (ESR) tests were performed in French primary care, despite the availability of more specific inflammatory markers such as C-reactive protein (CRP). Although ESR has been used in clinical practice for over a century, its diagnostic relevance in general practice remains uncertain.

Objectives: To determine the current, evidence-based indications for ESR testing in adult patients in general practice.

Methods: A systematic literature review was conducted between March 2020 and January 2022 across PubMed (Medline), Cochrane, Web of Science, Cairn, Lissa, Google Scholar, and La Revue Prescrire. The search combined MeSH terms and related keywords for “erythrocyte sedimentation rate” and “general practice” in English and French. Only studies focusing primarily on ESR testing in adult humans within a clinical context were included. Recent professional guidelines from relevant specialties were also analyzed to contextualize findings.

Results: The review identified nine original studies, seven literature reviews or expert opinions, and five clinical practice guidelines. Among them, 81% were published before 2000, highlighting a lack of recent research. Historically, ESR was used as a broad inflammatory screening test, including in asymptomatic patients and cancer screening—indications now considered obsolete. Current evidence supports ESR use only in specific inflammatory conditions: giant cell arteritis (Horton’s disease), rheumatoid arthritis, and Hodgkin lymphoma, often in association with CRP. For other diseases, CRP has replaced ESR due to its faster kinetics, better sensitivity, and higher diagnostic relevance.

Discussion: Despite its declining scientific value, ESR remains widely prescribed in French general practice. Its persistence likely reflects habit, simplicity, low cost, and slow diffusion of updated evidence. There are no formal national recommendations defining ESR use in primary care.

Conclusion: The ESR test appears largely obsolete in general practice, except in limited diagnostic contexts (Horton’s disease, rheumatoid arthritis, Hodgkin lymphoma). Physicians should be encouraged to use CRP alone as the preferred inflammatory marker. This work led to recommendations for best practice by the HAS on the use of sedimentation rate.

ID 2196- Polypharmacy in Older Adults: An Evidence Summary on Risks and Deprescribing Interventions

Artenca COLLAKU

Peace Corps Albania And Montenegro, Tirana, Albanie

Context: Polypharmacy, defined as the concurrent use of five or more medications, is a prevalent and growing global concern in geriatrics. While strongly linked to negative health outcomes, research is complicated by a lack of definitional standardization. Modern management focuses not simply on reducing pill counts, but on transitioning from problematic to appropriate polypharmacy through structured deprescribing.

Objectives: 1) Describe the risks and negative health outcomes associated with polypharmacy in older adults 2) Evaluate the role, effectiveness, and implementation of deprescribing as a key management strategy to mitigate these risks.

Methods: Key systematic reviews, meta-analyses, and randomized controlled trials (RCTs) on the subject were cited in the narrative review of the literature that served as the foundation for the synthesis. The STOPP/START criteria and the AGS Beers Criteria® are two evidence-based deprescribing guidelines that were emphasized. High-quality study designs were used to summarize established associations and intervention outcomes.

Results: Adverse drug reactions, falls, frailty, functional and cognitive decline, hospitalization, and increased mortality are just a few of the negative outcomes for which polypharmacy is an independent risk factor. A vicious cycle is produced by a reciprocal relationship with frailty. Strong evidence supports deprescribing interventions. RCTs and meta-analyses show that these interventions are useful, secure, and successful, dramatically lowering death and fall rates without raising adverse events . Medication review clinics and multidisciplinary team approaches are examples of successful models. The majority of older adults are willing to deprescribe if advised by their clinician.

Discussion: The findings underscore that polypharmacy is a major patient safety issue. The paradigm has shifted from indiscriminate medication reduction to optimized, evidence-based therapy. Deprescribing, facilitated by validated tools and a shared decision-making approach, is a core strategy to break the cycle of harm. Its effectiveness in diverse settings confirms its clinical utility. An acknowledged lack of a single, standardized definition for polypharmacy, complicates research and consistent application.

Conclusion: Polypharmacy in older adults is a high-risk, prevalent condition strongly associated with serious negative health outcomes. Structured deprescribing, guided by established criteria and patient-clinician collaboration, is an effective and safe intervention to reduce these risks, moving therapy from problematic to appropriate.

ID 2141- Patients' perceptions of the carbon footprint of medicines in primary care: a qualitative study

Elsa DELHOMMEAU [(1)] , Guillaume FORTIN [(2)]

(1) Upec, Thorigny-Sur-Marne, France
(2) Upec, Paris, France

Context: Climate change is a major public health challenge, with direct and indirect impacts on population health. Healthcare systems themselves contribute significantly to greenhouse gas emissions, particularly through the life cycle of medicines, including production, distribution, use, and disposal. In primary care, discussions around appropriate prescribing, deprescribing, and "right care" are increasingly linked to environmental sustainability. However, patients' perceptions of the carbon footprint associated with medicines remain poorly explored.

Objectives: To explore patients' perceptions of the carbon footprint of their medication consumption in primary care, including their views on responsibilities and possible individual or collective actions.

Methods: A qualitative exploratory study was conducted using semi-structured interviews with adult patients receiving primary care. Participants were recruited through purposive sampling to ensure diversity of profiles. Interviews were audio-recorded, transcribed verbatim, and analysed using

thematic analysis. Data collection and analysis were performed iteratively. Data saturation was reached after the tenth interview, and the two subsequent interviews confirmed saturation. Triangulation between researchers was undertaken to enhance the credibility of the analysis.

Results: Patients demonstrated partial awareness of the carbon footprint of medicines, most often associating it with drug degradation and disposal rather than with manufacturing or distribution processes. Responsibility for medication overconsumption was mainly attributed to the healthcare system, including the state, pharmaceutical industry, and prescribing physicians. Patient education on the links between health and environmental sustainability was perceived as important but currently insufficient. Views on individual actions varied: some participants expressed a perceived necessity to act at a personal level, while others highlighted difficulties in changing behaviours or expressed feelings of powerlessness, sometimes accompanied by pessimistic views regarding the future of the planet.

Discussion: These findings reveal an emerging but fragmented understanding of the environmental impact of medicines among patients. Tensions between individual responsibility and systemic responsibility were prominent, as well as concerns about the effectiveness of individual-level actions.

Conclusion: Exploring patients' perceptions of the carbon footprint of medicines provides valuable insights for supporting discussions on appropriate prescribing and deprescribing in primary care. Integrating these representations into clinical practice may help foster more acceptable conversations around environmental sustainability, right care, and health promotion in primary care.

ID 114- Deprescribing in practice a cross sectional study

Amelie RICHARD

Accept, Uca, Clermont Ferrand, France

Context: Multiple potentially inappropriate drug prescriptions increase in older adults. There are many benefits to deprescribing, for patients and for One Health.

Objectives: The objective was to measure the acceptability and rate of deprescribing among seniors aged 75 and over, using deprescribing support tools, as REMEDI[e]S (REview of potentially inappropriate MEDIcation pr[e]scribing in Seniors). The secondary objective was to collect the reasons for deprescribing

Methods: Observational study in a multidisciplinary health center from October 2023 to May 2024. The study population consisted of patients aged 75 and older with at least five medications. The data collected were: age, sex, medical history, creatinine clearance. The data presented were in numbers, mean, standard deviation, median, interquartile range. Deprescribing was compared using Fisher's exact tests for age, gender, and number of medications. The effect of each variable was estimated using the adjusted odds ratio and its 95% confidence interval. All statistical tests were two-tailed and performed at a 5% risk of type I error by BiostaTGV. The South East CPP validated this study (2023/CE 26).

Results: Sixty-nine patients participated; average age 85.4 years and 68% women. The average number of drugs was 6.9. Deprescribing was accepted at 95.6%. Deprescribing carried out in 49% of prescriptions. Deprescribing was more performed when patients had seven or more medications ($p < 0.05$). PPIs accounted for 44% of deprescribed medications, followed by anxiolytics, antidiabetics, and antihypertensives. The main reason for deprescribing was "lack of indication" (49%), followed by "dose unsuitable for renal function" (22%), "unfavorable risk-benefit ratio" (16%), and "inappropriate prescription duration" (13%).

Discussion: Few studies focus on analyzing deprescribing in practice by general practitioners.Tools to assist with deprescribing exist in France. The application of REMEDI in everyday practice should enable the implementation of deprescribing, which is widely accepted by older people, while reducing the time doctors spend on this process. This study encourage general practitioners to implement deprescribing, given its feasibility and acceptability as highlighted in this study.

Conclusion: The rates of acceptability and implementation of deprescribing can encourage general practitioners to discuss the subject of deprescribing with their patients.

ID 1784- I Have My Doubts About Stopping': Caregivers' Role in the Decision to Discontinue Antidepressants in Older Adults

Ellen VAN LEEUWEN, Viroux MARGOT, Bryssinck LAURE, Thierry CHRISTIAENS

Ghent University, Ghent, Belgique

Context: Long-term use of antidepressants (ADs) is common, particularly among older adults who are at greater risk of adverse effects and drug interactions due to age and polypharmacy. Informal caregivers often play a role in managing care and medication, making their perspectives of the discontinuation of unnecessary long-term AD use in older adults relevant.

Objectives: This study examines caregivers' views on discontinuing long-term AD in older adults

Methods: Eleven semi-structured interviews were conducted with caregivers of individuals aged 75+ who had been using ADs for over a year for depression and clinically stable. Interviews were thematically analyzed.

Results: The 11 participants (9 females; 49–75 years) were all family members (e.g. partners, children). Caregivers identified several factors influencing their perspectives. Many were hesitant to discontinue ADs due to perceived benefits for the older adult's quality of life and fears of relapse, which they believed could negatively affect the older adult's well-being as well as increase their own caregiving burden. Limited knowledge about ADs, depression, and their side effects contributed to their preference for maintaining the status quo. Caregivers emphasized the importance of a stable social network and living conditions as facilitators of discontinuation but noted that these factors were often lacking in older adults. While some caregivers preferred leaving decisions to the GP and the older adult, others expressed a desire to be actively involved in the process. Moreover, they saw themselves as potential facilitators by monitoring mental health changes during discontinuation and providing support. GPs were viewed as central to initiating and guiding the discontinuation process.

Discussion: This is the first study exploring caregivers' perspectives on discontinuing long-term AD in older adults, highlighting their pivotal but underutilized role in this process. We purposely sampled 11 caregivers from different geographic regions in xx to ensure we fully captured a wide range of opinions and the data reached saturation.

Conclusion: Caregivers' perspectives on discontinuing long-term AD use are shaped by limited knowledge, concerns about relapse, and a strong desire to support the older adult. Caregiver education, improved communication, and active involvement of caregivers by the GP is recommneded to facilitate the discontinuation of long-term AD in older adults.

Corresponding author: Ellen Van Leeuwen, ellen.vanleeuwen@ugent.be

ID 1446- Deprescribing long-term use of antidepressants: strategies for clinical practice

Ellen VAN LEEUWEN [(1)] , Hanne CREUPELANDT [(1)], Joke PAUWELYN [(1)], Catherine WOODS [(2)], Adam GERAGHTY [(3)], Hannah BOWERS [(3)], Andrew MORIARTY [(4)], Tony KENDRICK [(3)]

(1) Ghent University, Ghent, Belgique
(2) Oxford University, Oxford, Royaume-Uni
(3) Southampton University, Southampton, Royaume-Uni
(4) University York, York, Royaume-Uni

Context: Long-term antidepressant use is high in high-income countries. Depression guidelines recommend that antidepressants should be taken up to 6-12months after remission and up to 2years after remission in those at high risk of relapse. However, an increasing number of patients who feel well continue to use antidepressants much longer than recommended, even for years, without clear indication. This long-term usage contributes to the

rising consumption of antidepressants. For health care professionals and patients, fear of relapse is a major reason for not initiating a discussion about discontinuing the antidepressant. The workshop integrates the latest research findings with clinical aspects and offers practical insights for safe and effective deprescribing long-term antidepressant use.

Objectives: Learning Objectives: Understanding the rationale, the pro and the cons of deprescribing long-term antidepressants, including the risks and benefits with long-term use • Insights into the pharmacological principles and the tapering schemes for deprescribing antidepressants • Recognize potential barriers to deprescribing antidepressants and explore strategies to overcome them. • Develop strategies for engaging patients in discussions about deprescribing antidepressants, and supporting them through the deprescribing process. • Collaborating with a multidisciplinary healthcare team in the deprescribing process.

Teaching method and workshop: This workshop stimulates intensive interaction with the participants by using clinical cases, poll votes, video fragments and discussions of participants' views and experiences.

Expected outcomes: dentify indications for deprescribing long-term antidepressant use based on current evidence and clinical guidelines. Develop individualized tapering plans applying pharmacological principles and considering withdrawal risks. Recognize common barriers to

Conclusion: This workshop aims to increase participants' confidence by providing practical tools, and to facilitate safe and effective deprescribing long-term antidepressants in clinical practice. In addition, the workshop encourages a dialogue between researchers, clinicians, and other stakeholders to address this deprescribing challenge.

Corresponding author: Ellen Van Leeuwen, ellen.vanleeuwen@ugent.be

ID 596- Deprescribing in Context: a systems-oriented mixed-methods study of professional and patient perspectives (DEPREFLEX)

Matthias BRUNN [(1)] , Etienne NOUGUEZ [(2)], Jonathan SICSIC [(3)]

(1) Liepp-Sciences Po, Paris, France
(2) Liepp/cso-Sciences Po, Paris, France
(3) Liraes-Université Paris Cité, Paris, France

Context: Deprescribing is often framed as a clinical decision, yet in everyday general practice it emerges from broader system dynamics: professional routines, organizational arrangements, medico-legal concerns, economic incentives, and the growing importance of environmental considerations. Understanding these interacting factors is essential for designing scalable deprescribing strategies. The DEPREFLEX study adopts a systems-oriented and action-research approach embedded within a network of GPs, specialists, pharmacists, nurses, patients, associations, and policy interlocutors.

Objectives: To examine how clinicians and patients perceive deprescribing, how different framings (clinical, economic, environmental) gain or lose legitimacy, and which organizational mechanisms in primary care enable or hinder deprescribing in practice. Findings will directly inform the co-construction of a discrete choice experiment (DCE) and practical tools for general practice.

Methods: This mixed-methods study combines qualitative interviews and subsequent quantitative stated-preference modeling. The qualitative phase (February–May 2026) includes ~30 purposively sampled participants across diverse practice settings (solo GPs, multidisciplinary centers, pharmacists, and patients). Interview guides explore perceived levers/barriers, coordination and documentation routines, medico-legal "cover", and interpretations of deprescribing framed through clinical priorities, cost considerations, or environmental sustainability. Interviews are recorded, transcribed, anonymized, and analyzed thematically through an abductive approach by a multidisciplinary team. Iterative member-checking with our actor network refines interpretations and supports the development of DCE attributes and levels.

Results: Data collection is underway. By July 2026, we expect to report clearly identified preliminary themes such as: dominant framings of deprescribing among different actors; the role of team routines and pharmacist collaboration; organizational

facilitators and bottlenecks; and areas of convergence/divergence between professionals and patients. These results will be presented as robust interim findings from the qualitative phase.

Discussion: Early insights indicate that deprescribing decisions cannot be separated from system Context: accountability distribution, documentation practices, perceived risks, and coordination mechanisms profoundly shape what GPs consider feasible or legitimate. Understanding these dynamics is essential for designing deprescribing policies and tools aligned with real-world primary care constraints.

Conclusion: DEPREFLEX provides system-aware evidence to inform policy-relevant, scalable deprescribing strategies. By integrating qualitative insights into a co-constructed DCE and practice tools, this study aims to support GPs in implementing deprescribing within realistic organizational conditions.

Corresponding author: Matthias Brunn, matthias.brunn@sciencespo.fr

ID 917- Deprescribing in an out patient medical clinic at a tertiary care hospital in Sri Lanka-A quality improvement project

Ushettige PERERA

Teaching Hospital Rathnapura,sri Lanka, Colombo, Sri lanka

Context: Deprescribing is recommended especially in elderly population where polypharmacy would lead to many adverse effects. Previous studies have focused solely on disease specific or medication-specific deprescribing such as reducing potentially inappropriate (e.g., antipsychotics) or unnecessary (e.g., proton pump inhibitors) medications.One Australian study evaluated a hospital-based deprescribing intervention designed to reduce total drug burden . There were no such studies done in Sri Lanka.

Objectives: General Deprescribe the medications that are no longer required Specific To assess the prevalence of deprescribng medications To identify categories of deprescribing medications To assess patient and disease characteristics which are associated with deprescribing medications To identify reasons of deprescribing

Methods: Method It was a Randomized controlled study with sample size of 135. We used interview-based questionnaire to collect data from clinic patients. Study setting was medical clinic of National Hospital Kandy-Sri lanka Analyzing method used was SPSS-20.

Results: Results Prevalence of the long-term unnecessary drugs was 30.3%. Categories of unnecessary drug groups identified were antiplatelets, proton pump inhibitors, frusemide and drugs used for neuropathic pain such as amitriptyline. There were patients ranging from 30year to 87years. Most of the unnecessary drugs were found in patients treated for ischemic heart disease (44.4%), diabetes (34.1%), hypertension (52.6%) and strokes (13.3%). Two main reasons for deprescribing were, no indication to continue the drug and long duration. According to our study majority of deprescribing was due to no proper indication (68.1%)

Discussion: Rising costs attributed to unnecessary drugs represent a major threat to achieving sustainable health care [13]. By doing this study we found out the commonly encountered drugs which were continued unnecessarily.Sri Lanka is going through an economic crisis, this quality improvement project, will reduce medication burden and save a huge amount of money spent on these medications.

Conclusion: Conclusion Most of our patients with ischemic heart disease, stroke, hypertension, diabetes was started on drugs to be continued for long durations.We should deprescribe the unnecessary drugs according to guidelines. The drugs which were started for short lasting complaints should be stopped when the indication is over. There by we can reduce the cost spent on these medications.

Lifestyle

ID 2151- A Digital Lifestyle Coaching Intervention Delivered by Trained Health

Coaches: Outcomes Across Diverse Primary Care Populations

Vipan BHARDWAJ [(1)] , Vincent SAI [(1)], Abhishek SHARMA [(2)], Mina GUPTA [(1)], Nina JHITA [(1)]

(1) Modality Partnership, Nationwide, Royaume-Uni
(2) Goqii Uk, Nationwide, Royaume-Uni

Context: Lifestyle-related factors such as obesity, inactivity, and poor diet contribute significantly to multimorbidity and primary care demand. Traditional lifestyle programmes often fail to engage working-age adults, underserved groups or people with language or cultural barriers. To address these issues we implemented a digital lifestyle coaching intervention delivered by trained health coaches to provide personalised behaviour-change support at scale.

Objectives: To assess the impact of digital lifestyle coaching on: 1. Weight, metabolic outcomes and HbA1c 2. A&E utilisation 3. Patient engagement and retention 4. Equity across diverse populations

Methods: A retrospective analysis was undertaken using operational data from NHS patients enrolled in the digital coaching service. The evaluation was conducted across multiple primary care sites serving approximately 500,000 patients Outcomes included weight change, HbA1c, medication use, A&E utilisation, and retention. Qualitative feedback was collected through user reports.

Results: Since implementation, more than 7,000 patients have participated in the intervention. Quantitative outcomes included: - Mean weight change −2.2 kg overall and −3.9 kg among 12-week completers - HbA1c reductions of −9.9 mmol/L in one cohort and −5.5 mmol/mol in another - 90% reduction in hypoglycaemia-related medication use in one region A&E utilisation 37.7% lower than system average in a high-need cohort Retention rates reached 80% where coaching was provided, compared with 15% in digital-only programmes. Patient feedback highlighted improved motivation, deeper understanding of nutrition and increased confidence in self-management. Cultural and multilingual adaptations supported strong engagement among ethnic minority and deprived populations. Engagement was particularly strong among underserved groups, indicating that culturally tailored coaching may help reduce health inequalities.

Discussion: Personalised digital coaching delivered by trained health coaches significantly improved metabolic outcomes and engagement in diverse communities. Combining behavioural science with cultural adaptation was essential for reaching underserved populations. These outcomes highlight the potential for scalable digital coaching models to support metabolic health at population level.

Conclusion: Digital coaching interventions can deliver measurable health improvements, reduce A&E utilisation and support primary care sustainability when integrated into population-health pathways. This model demonstrates a scalable approach to strengthening primary care delivery and may inform international efforts to modernise primary care.

Corresponding author: Vipan Bhardwaj, vipan.bhardwaj@nhs.net

ID 2149- A Digital Lifestyle Coaching Intervention to Support Behaviour Change in Primary Care

Vipan BHARDWAJ [(1)] , Vincent SAI [(1)], Abhishek SHARMA [(2)], Mina GUPTA [(1)], Nina JHITA [(1)]

(1) Modality Partnership, Nationwide, Royaume-Uni
(2) Goqii Uk, Nationwide, Royaume-Uni

Context: Lifestyle-related conditions such as type 2 diabetes, hypertension, obesity, and stress place increasing pressure on primary care. Traditional behavioural interventions often rely on structured education or group programmes that many patients find difficult to access. Demand for flexible, personalised support has grown as patients seek help managing long-term conditions and fluctuating symptoms alongside busy lifestyles. Primary care teams required an at-scale approach capable of providing sustained behaviour-change support without increasing clinician workload.

Methods: A digital lifestyle coaching intervention was implemented across an organisation serving 500,000 patients across multiple primary care sites, supporting more than 7,000 patients to date. Patients were invited through routine clinical pathways, targeted outreach and proactive

identification of at-risk/high need individuals. The innovative model combined one-to-one coaching with daily digital prompts, reflective check-ins and personalised behaviour-change plans. Coaches maintained regular asynchronous contact and scheduled calls, enabling continuity and accountability over several months. Scale was achieved by embedding the programme into existing long-term condition workflows, allowing large cohorts of patients to begin personalised coaching simultaneously. Strengths included the flexibility of remote engagement and the ability to support large numbers of patients in parallel. Safety checks were embedded at critical points and concerns about clinical safety addressed in DTAC, DPIA and DCB0129/0160-aligned safety assessment.

Originality: Unlike traditional lifestyle services, this intervention delivered personalised behavioural support at population scale. Its blend of digital tools and human coaching provided a continuous, adaptive model rather than isolated educational sessions, making

Lessons learned and future implication: Embedding the programme into routine pathways increased uptake and normalised lifestyle coaching as a core component of chronic disease management. Future development may include tighter integration with long-term condition recall, digital triage and soci

Discussion: The intervention demonstrated that large-scale personalised lifestyle support is feasible in primary care and can complement clinician-led care by improving self-management and reducing reliance on short, episodic consultations.

Conclusion: Mean weight change of -3.9kg, HbA1c reduction of -9.9mmol/mol and 37.7% reduction in A&E utilisation reflect significant population-health improvement. This scalable digital lifestyle coaching model enabled sustained behaviour change, enhanced patient confidence with retention rates of 80% in diverse primary care communities.

ID 2104- A Digital Self-Management Tool to Improve Patient Wellbeing in Primary Care

Mina GUPTA [(1)] , Vincent SAI [(1)], Grace GIMSON [(2)], Nina JHITA [(1)], Tom RATCLIFFE [(1)]

(1) Modality Partnership, Nationwide, Royaume-Uni
(2) Holly Health, Nationwide, Royaume-Uni

Context: Many patients present to primary care with concerns linked to anxiety, low mood, sleep difficulties, inactivity and long-term conditions that require sustained self-management support. Traditional primary care involves brief clinical consultations with limited opportunity for regular follow-up or coaching. This often leads to repeated appointments, increased demand and frustration for patients who struggle to maintain progress. Practices sought an at-scale solution to offer continuous, personalised wellbeing support without increasing clinician workload.

Methods: A digital self-management tool was introduced across practices serving 500,000 people to help patients build healthier routines through personalised support. This innovative programme was offered to individuals with frequent attendance patterns, multimorbidity, or persistent wellbeing challenges. Implementation followed a staged approach, beginning with small cohorts to understand adoption patterns and refine onboarding. Patients chose goals related to sleep, emotional wellbeing, physical activity or lifestyle behaviours. The tool provided daily nudges, behavioural prompts, reflective check-ins and progress was monitored through a structured wellbeing framework. Strengths included accessibility outside appointment hours and ability for patients to engage at their own pace. Safety checks were embedded at critical points and concerns about clinical safety addressed in DTAC, DPIA and DCB0129/0160-aligned safety assessment.

Originality: Unlike traditional self-help resources, the tool offered personalised, adaptive guidance tailored to individual behaviour patterns. Its design allowed for continuous micro-engagement rather than episodic clinical contact. This contrasted with existing wel

Lessons learned and future implication: Teams learned that identifying suitable patients early—such as frequent attenders or those managing multiple long-term conditions—enhanced impact. Future developments may include integration with social prescribing, group coaching or condition-specific pa

Discussion: The experience showed that digital self-management support can complement primary care by empowering patients, reducing administrative demand and offering continuity between clinical interactions. Engagement was strongest when practices introduced the tool as part of a broader personalised care approach.

Conclusion: 82% patients using the personalised digital self-management tool felt more in control of their health, 68% reported improved wellbeing and appointment utilisation decreased by 15% in frequent attenders. This solution represents a scalable, cost-effective and patient-centred approach to enhancing holistic care.

ID 1649- Assessment of Behaviour Change Interventions using a Mixed-methods Approach in Primary Healthcare Centers

Naim JERLIU [(1)] , Ariana BYTYCI KATANOLLI [(2)], Jana GEROLD [(3)], Nicu FOTA [(4)], Bajram MAXHUNI [(4)], Iliriana MIFTARI [(5)], Nicole PROBST HENSCH [(6)]

(1) Medical Faculty, University Of Prishtina; National Institute Of Public Health Of Kosovo, Prishtina, Kosovo
(2) National Institute Of Public Health Of Kosovo; Accessible Quality Healthcare (aqh) Project, Prishtina, Kosovo
(3) Swiss Centre For International Health, Swiss Tropical And Public Health Institute (swiss Tph), Allschwil, Switzerland; University Of Basel, Basel, Suisse
(4) Accessible Quality Healthcare (aqh) Project, Prishtina, Kosovo
(5) University Of Prishtina (up), Faculty Of Agriculture And Veterinary, Prishtina, Kosovo
(6) Department Of Epidemiology And Public Health, Swiss Tropical And Public Health Institute (swiss Tph), Allschwil, Suisse

Context: The Kosovo Non-Communicable Disease Cohort (KOSCO), a collaborative study between the Swiss TPH, NIPHK, and UP, has been implemented in Kosovo since 2019. The AQH project in collaboration with NIPHK are implementing behaviour change interventions to facilitate improvement in lifestyle behaviours.

Objectives: This study assesses the impact of behaviour change interventions on health behaviours, participants' stages of health behaviour change, as well as describes experiences and perceived benefits of motivational counselling.

Methods: Study participants (n=907) were recruited from 12 municipalities participating in the KOSCO study. For the quantitative study, data on lifestyle behaviours and stages for behavioural change were used. For the qualitative study, in-depth interviews were conducted with 26 cohort participants who had undergone motivational counselling.

Results: Quantitative study: 13% of study participants are smokers, 86% do not adhere to WHO recommendations for physical activity, 93% do not consume fruits and vegetables based on WHO recommendations, and 61% are obese. In all lifestyle behaviours: physical activity, nutrition, smoking, alcohol consumption participants were in precontemplation phase. Qualitative study: Participants who received motivational counselling describe positive experiences and willingness to start to change their health behaviors. Main barriers for physical activity behaviors are: lack of outdoor facilities for physical activity, weak health conditions, and insufficient knowledge on types of exercises.

Discussion: More tailored primary healthcare approaches in accordance with patients' views need to be considered for behaviour change interventions to efficiently facilitate lifestyle behaviour change.

Conclusion: To improve the health behaviours, the following tailored approaches are suggested: a) strengthened referral mechanism b) specialized services for smoking cessation; c) delivery of group physical activity sessions.

Corresponding author: Naim Jerliu, naim.jerliu@uni-pr.edu

ID 739- Enhancing Preventive care, Equity and Community-Oriented Primary Healthcare through Structured Lifestyle Intervention Pathways in Rural Practice

Natalie DALY [1] , Carl DEANEY [2], Michelle DAFF [3], Sophie KIRK [1], Sarah KNUDSEN [3]

(1) Gpa, Louth, Royaume-Uni
(2) Gp, Louth, Royaume-Uni
(3) Hca, Louth, Royaume-Uni

Context: Lifestyle-related risk factors remain major contributors to cardiometabolic morbidity. Rural populations frequently face barriers to accessing preventive programmes, including transport challenges, limited local services and reduced health literacy. WONCA Europe emphasises equity, continuity, prevention and community orientation; Principles that can be operationalised through structured lifestyle interventions combining personalised support with accessible behaviour-change pathways. This project evaluated the delivery and impact of an integrated lifestyle referral model incorporating exercise, weight management support, smoking-cessation and alcohol reduction interventions.

Methods: A mixed-methods evaluation was undertaken. During routine consultations, clinicians conducted structured lifestyle assessments, using patient responses to guide referrals to one of four evidence-based pathways: supervised exercise programmes, weight management support, smoking cessation services or alcohol reduction programmes. Many participants enrolled in a 12-week combined intervention programme. Quantitative data captured referral volumes across programme types, while qualitative insights were obtained from patient feedback and discussions, analysed thematically to explore drivers of engagement, perceived benefits and barriers.

Originality: To assess the effectiveness, reach and community benefit of structured lifestyle intervention pathways within a rural primary care population. To explore how personalised referrals and supported behaviour change improve health outcomes, engagement and pat

Lessons learned and future implication: Between January-October 2025, 391 patients were referred. 64 accessed smoking cessation support, six participated in health-coach alcohol reduction sessions, 84 joined weight management programmes and 155 enrolled in supervised exercise interventions. 82

Discussion: Structured lifestyle pathways demonstrated strong engagement and patient benefit, particularly when referrals were personalised and accessible. Interventions that matched individual needs supported sustainable behaviour change, motivation, confidence and social connection, promoting equitable preventive care. Capacity limitations restricted access for some, highlighting the importance of expanding provision and maintaining ongoing follow-up to maximise long-term health impact.

Conclusion: Structured, personalised lifestyle intervention pathways enhances preventive care, empowers patients and strengthens community-oriented primary healthcare. Combining supervised exercise, behavioural weight management, targeted smoking and alcohol reduction support aligns with WONCA priorities and supports long-term population health. Expanding programme capacity will improve reach and outcomes in rural populations.

ID 435- Physical Activity Levels Among General Practitioners: A Regional Survey in Northern France

Jan BARAN, Constance BUTEL

Dmg Lille, Lille, France

Context: Physical activity (PA) is a key component of chronic disease prevention and management, yet remains insufficiently promoted in routine primary care. General practitioners (GPs) play a central role in PA counselling, and evidence suggests that their personal activity levels may influence their clinical practice. Understanding PA habits among GPs is therefore essential for strengthening PA promotion in primary care settings.

Objectives: To assess PA levels among GPs in the Hauts-de-France region, and to explore associations

between PA levels, gender, working hours, and PA promotion practices during consultation.

Methods: A cross-sectional descriptive and analytical study was conducted between February and June 2025 among practising GPs in the Hauts-de-France region. An online questionnaire incorporating the validated short International Physical Activity Questionnaire (IPAQ) was distributed through professional networks and mailing lists. Collected variables included sociodemographics, weekly working hours, PA promotion habits, and use of adapted physical activity (APA) prescriptions. Data analysis included descriptive statistics and comparative tests, with statistical significance set at $p < 0.05$.

Results: Among 449 respondents, 268 complete responses were included in the analysis. Based on the IPAQ scoring system, 44%of GPs reported a high PA level, 40% a moderate level, and 16% a low level. Although 95.5% declared promoting PA in consultations, only 54% reported doing so systematically. APA prescription and follow-up were reported by 28% and 25% of respondents, respectively. No significant association was found between PA level and gender or weekly working hours. However, GPs with higher PA levels were significantly more likely to promote PA to all their patients ($p = 0.02$).

Discussion: While GPs demonstrate relatively high personal PA levels, this does not translate into systematic counselling or APA prescription practices. Barriers may include limited training, lack of practical tools, and insufficient integration of PA resources within primary care structures.

Conclusion: Despite satisfactory PA levels among GPs, PA promotion and APA prescription remain suboptimal. Enhancing GP training, developing user-friendly prescription tools, and strengthening links with community PA resources could improve the integration of physical activity into everyday primary care practice.

ID 421- Impact of a Nationwide Incentive-Based Mobile Health Program on Physical Activity: Longitudinal Analysis of “Leumit FIT” Users

Shlomo VINKER [(1)] , Ilan GREEN [(1)], Eugeen MERZON [(2)], Avivit GOLAN COHEN [(1)], Ariel ISRAEL [(2)]

(1) Tel Aviv University, Tel Aviv, Israël
(2) Leumit Health Services, Tel Aviv, Israël

Context: Physical inactivity is a leading risk factor for chronic diseases and mortality. Mobile health (mHealth) interventions with behavioral incentives may promote physical activity in real-world settings, but evidence on long-term effectiveness at the population scale remains limited. Leumit FIT is a digital program deployed nationwide within Leumit Health Services (LHS) that provides rewards, such as fitness products and healthy-lifestyle vouchers, to encourage higher daily step counts.

Objectives: To evaluate whether sustained engagement with an incentive-based step-tracking app is associated with a change in daily physical activity among the general population.

Methods: We conducted a longitudinal analysis of anonymized step-tracking data from 75,253 LHS members aged ≥14 years who used the Leumit FIT application for at least one month. Daily steps were recorded via smartphone accelerometers and aggregated at the participant-month level. A linear regression model was applied to estimate within-individual changes in physical activity associated with each month of app usage, adjusting for age, sex, ethnicity, BMI, calendar year, and seasonal variation.

Results: Participants used the app for a median of 16 months. The mean baseline physical activity was 4,799 steps/day. Each additional month of app usage was associated with a statistically significant increase of approximately 60 steps/day ($p < 0.05$). After 24 months of continuous engagement, users achieved an average increase of ~1,400 daily steps. The trend was sustained without a plateau across the observation period.

Discussion: A nationwide mHealth incentive program demonstrated durable improvements in physical activity over more than 2 years of follow-up.

Conclusion: Scalable digital interventions may contribute meaningfully to preventive health strategies by motivating clinically relevant behavioral improvements.

ID 392- Effectiveness of physical activity promotion interventions on patients' physical activity adherence in primary care. A systematic review

Aline RAMOND, Léo BOULANGER, Samuel LEGEAY

Université D'angers (unité Pops, Département De Médecine Générale), Angers

Context: As stated byThe Worl Health Organization in 2020, physical activity is a huge health determinant. It contributes to prevent and to manage several non communicable diseased such as cardio-vascular diseases, diabetes or cancers that are responsible for more than hlaf of deaths in the world. Sustainable promotion of physical activity remains a major challenge for populations and health systems. Primary care is the first contact of health systems for most individuals and in charge of comprehensive and continuous care. Litterature is scarce on how much primary professionals may impact physical activity of their patients.

Objectives: Main : to systematically review litterature of the effectiveness of physical activity promotion interventions on patients' physical activity adherence in primary care. Secondary : to identify associated factors to effectiveness.

Methods: A systematic review is being conducted to analyse peer-reviewed articles on interventional comparative studies evaluating patients' adherence to physical activity after interventions in primary care. Pubmed, PsychInfo, Cochrane, EBSCO, Cairn and Web of science databases were explored from 2000 using research equations. Articles are being included if they report original studies focusing on physical activity promotion interventions for adult patients by primary care professionals in comparison to a control group and if they report outcomes related to patients' adherence. Selection of the articles is being made independently by two researchers, using Covidence. Included articles will be assesed for their methodological quality before extracting and synthesizing data. Effectiveness of interventions will be described, as well as clinicans-related, organizations-related and policy-related factors associated to effectiveness (micro, meso, and macro levels).

Results: In total, 1043 were identified by the litterature search. Selction of the article will be completed soon. Final results will be available before the WONCA congress.

Discussion: Results will be presented in regards to litterature including qualitative studies, and discussed with the congress audience including professionals, researchers and other stakeholders.

Conclusion: Deeper understanding on effectiveness of, and factors associated to, physical activity promotion interventions in primary care is needed to inform decision-making, and adapt clinical activities, profesionnal organizations and health policies, and finally improve population health.

ID 1219- The Role of Lifestyle Modification in Reversing Type 2 Diabetes: An Evidence-Based Review

Mona OSMAN

American University Of Beirut, Beirut, Liban

Context: Type 2 diabetes (T2D) represents a major global public health challenge, traditionally regarded as a progressive condition requiring lifelong management. In recent years, however, a growing body of scientific literature has examined the possibility of achieving remission through intensive lifestyle modification. As interest in non-pharmacological strategies increases, synthesizing existing evidence is essential to understanding the potential and limitations of lifestyle-based diabetes reversal.

Objectives: This literature review aims to gather, analyze, and organize scientific evidence regarding the role of lifestyle interventions in achieving T2D remission. The review focuses on two core

components: (1) the effectiveness of dietary, physical activity, and behavioral interventions; and (2) the biological mechanisms underlying remission

Methods: A narrative approach was used to review peer-reviewed scientific literature, published clinical practice guidelines, and review articles across different databases.

Results: Across the literature, substantial evidence supports the potential of lifestyle interventions to induce remission in T2D. Studies evaluating very-low-calorie diets, low-carbohydrate or ketogenic diets, and whole-food plant-based eating patterns report remission rates ranging from 30% to over 60% in the first year. Weight loss, particularly reductions ≥10–15% of body weight, consistently emerges as the strongest predictor of remission, primarily through reductions in liver and pancreatic fat and improvements in insulin sensitivity. Physical activity is shown to enhance metabolic function and support weight maintenance, though it is rarely sufficient alone. Behavioral strategies such as ongoing coaching, structured follow-up, and group support are widely reported as essential components for adherence and sustained remission.

Discussion: Literature consistently demonstrates that T2D possesses metabolic reversibility when targeted with intensive, structured lifestyle intervention. However, gaps remain regarding long-term sustainability, heterogeneous remission definitions, and barriers related to socioeconomic and cultural contexts.

Conclusion: This review highlights strong evidence that lifestyle modification can achieve T2D remission. Integrating these findings into clinical practice and public health strategies may shift diabetes management toward a remission-oriented model, although further research is needed to strengthen long-term evidence and implementation strategies.

ID 1199- Experiences of healthcare providers and patient with the LifestyleChecklist to support setting personalized lifestyle goals in primary care

Arda YILMAZ, Laura VAN DER VELDE, Celine DELHEZ, Anne DE BOER, Tobias BONTEN, Jessica KIEFTE, Rimke VOS

Leiden University Medical Centre, Leiden, Pays-Bas

Context: Lifestyle-related conditions such as cardiovascular disease (CVD) and type 2 diabetes mellitus (T2DM) remain highly prevalent despite growing awareness of the importance of healthy behaviours. In Dutch primary care, lifestyle counselling is routinely embedded in cardiovascular risk management, yet healthcare professionals (HCPs) face increasing time pressure that limits opportunities for personalised lifestyle support. The LifestyleChecklist was developed to structure lifestyle conversations by exploring patients' experiences, motivations, and barriers to support the HCPs, but little is known about how the tool is perceived by both patients and HCPs.

Objectives: To explore how patients and HCPs perceive the LifestyleChecklist in the context of primary care management of CVD and/or T2DM, and to identify facilitators and barriers to its implementation for delivering tailored lifestyle support.

Methods: Semi-structured interviews were conducted with HCPs and patients Interviews guides were based on the Consolidated Framework of Implementation Research and interviews were analysed inductively following Braun and Clarke's principles for thematic analysis.

Results: Seven patients and nine HCPs were interviewed, three overarching themes emerged. First, the LifestyleChecklist shifted consultation dynamics by enabling more reflective, personalised, and context-driven lifestyle discussions, strengthening therapeutic relationships, enhancing patient insight, and promoting shared decision-making. Second, logistical challenges formed the main barriers: LifestyleChecklist was not consistently completed in advance and often requires additional explanation since misinterpretation could increase time pressure within already complex consultations. Third, the LifestyleChecklist supported professional development among HCPs by revealing knowledge

gaps and increasing awareness of the multidimensional aspects of lifestyle factors, thereby enhancing competence and confidence in lifestyle counselling.

Discussion: The LifestyleChecklist can enhance lifestyle consultations within the limited time available by fostering deeper contextual understanding, promoting patient engagement, and supporting HCP skill development. However, its added value depends on adequate explanation, sufficient consultation time, and thoughtful integration into existing workflows. Training may further facilitate successful implementation.

Conclusion: The LifestyleChecklist offers a promising means to strengthen personalised lifestyle counselling in primary care for patients with CVD and T2DM. Its effectiveness relies on careful integration and appropriate support for both patients and HCPs. Further research should examine its impact on long-term lifestyle outcomes.

ID 1085- Income-related inequalities in lifestyle behaviours among European adults: cross-country evidence from 32 European countries using EHIS 2 and EHIS 3.

Juan A LOPEZ-RODRIGUEZ [(1)], Alicia SERRANO DE LA CRUZ [(2)]

(1) Semfyc; University Rey Juan Carlos, General Ricardos Primary Healthcare Center Madrid, Madrid, Espagne
(2) Preventive Services, Hospital Central De La Defensa Gómez Ulla;, Madrid, Espagne

Context: Unhealthy lifestyle behaviours—including physical inactivity, smoking and obesity—are major contributors to preventable morbidity and mortality across the world and in Europe. Socioeconomic inequalities strongly influence individual's ability to adopt healthy behaviours. Despite this, large-scale, harmonised cross-country comparisons covering a wide European region and multiple time points remain scarce. This study addresses this gap by analysing two waves of European health data across 32 countries.

Objectives: To quantify income-related inequalities in physical inactivity, smoking and obesity across European countries, and to assess whether these inequalities changed between waves of the European Health Interview Survey(EHIS).

Methods: We conducted a cross-sectional study using nationally representative data from 32 European countries participating in EHIS2 (2013–2015) and EHIS3 (2018–2020). Data from the United Kingdom, Switzerland and Turkey were incorporated following harmonisation procedures. Adults aged ≥15 years were included. Outcomes were physical inactivity (WHO-aligned indicators), current smoking, and obesity (BMI ≥30 kg/m²). Household equivalised-income (quintiles) was the exposure variable. Adjusted prevalence ratios and Relative Index of Inequality (RII) values were estimated using Poisson regression models adjusted for age and sex. Temporal stability was assessed by comparing RII patterns across survey waves.

Results: Clear income-related inequalities were observed for the three outcomes. Countries tended to maintain similar inequality patterns across EHIS2 and EHIS3, indicating limited change over time. Western and Northern European countries—including the United Kingdom, Belgium, France and the Netherlands—showed the largest inequalities, with several RII values frequently exceeding 2. In contrast, multiple Eastern and Southern European countries (e.g., Romania, Bulgaria, Slovakia) exhibited weaker or inconsistent gradients. Smoking and obesity systematically displayed the highest inequality levels across countries, with marked gradients that persisted in both survey waves. Country-level correlations of RII values between EHIS waves were high, suggesting stable and persistent inequality structures across Europe.

Discussion: Income-related inequalities in key lifestyle behaviours remain substantial across Europe. Smoking and obesity are consistently more prevalent among lower-income groups, and inequalities in physical inactivity persist despite ongoing public health efforts.

Conclusion: Income-related inequalities in lifestyle behaviours are pervasive across Europe and stable over time. Policies addressing the structural and contextual determinants of health are needed to reduce these gaps.

Corresponding author: Alicia Serrano De La Cruz, aliserra@ucm.es

ID 502- Combined effect of diet quality and physical activity on depressive symptom in Korean Adults: from the Korea National Health and Nutrition Examination Survery (KNHANES)

Minseon PARK

Seoul Niational Universty, Seoul

Context: Diet quality and physical activity are modifiable lifestyle factors associated with depressive symptoms, yet their combined effects remain poorly understood.

Objectives: This study examined the joint association of diet quality, measured using the Korean Healthy Eating Index (KHEI), and total energy expenditure (EE) with depressive symptoms in adults.

Methods: We analyzed data from 18,807 adults aged ≥20 years from the the KNHANES. Diet quality (low vs. high KHEI) and total EE (low vs. high) were categorized. Depressive symptoms were defined as a PHQ-9 score ≥10. Logistic regression models estimated ORs adjusting for sociodemographic characteristics, health behaviors, and chronic disease status. Sex- and age-stratified analyses were conducted.

Results: Participants with both low KHEI and low EE had significantly higher odds of depressive symptoms compared with those with high KHEI and high EE. Elevated risks were also observed for the high KHEI/low EE and low KHEI/high EE groups. In sexstratified analyses, poor diet quality remained associated with depressive symptoms in women regardless of EE, whereas in men the association was evident primarily in the low KHEI/low EE group. Age-stratified analyses showed the strongest combined effect among middle-aged adults. Young adults demonstrated increased risk with low KHEI even at higher EE levels, while older adults were particularly sensitive to low EE.

Discussion: Our results align with previous national evidence showing that higher adherence to the KHEI is associated with a lower burden of depressive or psychological symptoms in adults, particularly among women. Age-related patterns also suggest that younger adults may require targeted support to improve fundamental dietary behaviors, while older adults may benefit more from interventions aimed at maintaining adequate physical activity. Incorporating such demographic nuances into public health strategies could enhance the effectiveness of lifestyle-based depression prevention efforts.

Conclusion: This study examined the joint association of diet quality, measured using the Korean Healthy Eating Index (KHEI), and total energy expenditure (EE) with depressive symptoms in adults.

ID 2077- Dictating diet or offering liberty? The Triglyceride-Glucose index as a practical tool for shared decision-making in primary care diabetes management

Ekin DIKMEN, Hamdi Nezih DAĞDEVIREN, Serdar ÖZTORA, Melike Sena AKYAR

Trakya University, School Of Medicine, Family Medicine Department, Edirne, Türkiye

Context: The principle of ‘‘Liberty’’ in family medicine implies respecting patients’ autonomy to make informed decisions about their own health. However, rigid and generic dietary restrictions often perceived as a loss of autonomy by patients with Type 2 Diabetes. To empower patients, clinicians need objective data to offer a ‘‘menu of effective options’’ rather than a single strict prescription.

Objectives: This study aims to evaluate how specific, patient-selected lifestyle modifications (e.g., choice of cooking fat, sugar restriction, exercise frequency) independently impact insulin resistance using the Triglyceride-Glucose index. The goal is to validate Triglyceride-Glucose index as a feedback tool that enables shared decision-making.

Methods: A cross-sectional study was conducted with 252 diabetic patients in a training hospital setting (Nov 2024–Apr 2025). Instead of a global compliance score alone, individual dietary habits of the patients regarding the Mediterranean diet and physical activity frequency were analyzed individually. Stepwise linear regression was used to quantify the "metabolic return" of each specific lifestyle choice on the Triglyceride-Glucose index.

Results: The analysis revealed that patients do not need to change everything at once to see results. The most potent ''options'' for lowering the Triglyceride-Glucose index were identified as: (1) Using olive oil as the primary fat source (β= -0.48), (2) Avoiding sugary beverages, and (3) Exercising ≥3 days/week. Patients adopting these specific choices achieved a Triglyceride-Glucose value significantly below the identified cut-off of 8.97, regardless of other factors.

Discussion: These findings challenge the traditional ''all-or-nothing'' approach to dietary compliance. The strong association between healthy habits and improved Triglyceride-Glucose index indicates that prioritization of high-yield changes such as olive oil consumption is clinically more effective than generic advice.

Conclusion: The Triglyceride-Glucose index allows family physicians to move from ''dictating restrictions'' to offering ''effective dietary habits''. By demonstrating that specific actions-like switching to olive oil or walking 3 days a week-can independently reset metabolic risk (Triglyceride-Glucose index: <8.97), we empower patients to exercise their liberty in choosing the lifestyle modifications they can sustain. This fosters a therapeutic alliance based on partnership rather than compliance.

ID 1499- Cumulative effects of the components of dyslipidemia on Incidence of Cardiovascular Diseases in Korean Young Adults: A Nationwide Cohort Study

Yang-Hyun KIM, Gyu Bae LEE, Jongsung LEE

Korea University Anam Hospital, Department Of Family Medicine & College Of Medicine, Korea University, Seoul, Corée, République de

Context: Lipid abnormalities act as independent risk factors for CVD in young adults remains a matter of debate.

Objectives: To study the cumulative effect of the components of dyslipidemia on incident cardiovascular diseases in young Korean adults.

Methods: Young adults (n =1,335,776; 20~39-years-old) who participated in the national health examinations for 4 consecutive years from 2009 to 2013 were identified in a nationwide population-based cohort in Korea. We calculated the cumulative exposure score (CES, range: 0–4) of dyslipidemia components from the four consecutive health examinations, based on the presence of high total cholesterol (TC ≥240 mg/dL), high triglycerides (TG ≥200 mg/dL), elevated low-density lipoprotein cholesterol (LDL-C ≥160 mg/dL), and reduced high-density lipoprotein cholesterol (HDL-C <40 mg/dL). Hazard ratio (HR) and 95% confidence interval (CI) for incident CVD, MI, and ischemic stroke were analyzed using the multivariable Cox proportional-hazards model according to the CES of the components of dyslipidemia.

Results: All four components of dyslipidemia showed a dose-response relationship with CES in both CVD and MI. MI was higher in patients with high TC CES4 (HR: 2.38); high LDL-C CES4 (HR: 2.39); high TG CES4 (HR: 1.50); and low HDL-C CES4 (HR: 1.35). CVD was higher in patients with high TC CES4 (HR:1.87); high LDL-C levels, CES 4 (HR: 1.85); high TG CES 4 (HR: 1.37); and low HDL-C CES 4 (HR:1.28). For ischemic stroke, the association was attenuated, but low HDL and high TG showed increased risks among men aged 30–39 years (high TG CES 2 and CES 3; low HDL-C CES 3). Increased risks were also found in women aged 30–39 years (high TG CES 4) and 20–29 years (TG CES 3).

Discussion: These findings suggest that the relationship between lipid composition and cardiovascular disease risk may vary by age and sex.However, high triglycerides and low HDL-C may deserve attention in women. These findings suggest that the relationship between lipid composition and cardiovascular disease risk may vary by age and sex.

Conclusion: In young adults, cumulative exposure to dyslipidemia is significantly associated with CVD risk in an age- and sex-specific manner.

Corresponding author: Gyu Bae Lee, glee@korea.ac.kr

ID 1378- Impact of LDL-C point of care testing (POCT) on reaching the primary cardiovascular target and patient compliance in general practice

Maria ZAMPARELLA [(1)] , Arianna MORETTI [(2)]

(1) Siicp, Bari, Italie
(2) Siicp, Rome, Italie

Context: Low-Density Lipoprotein Cholesterol (LDL-C) hypercholesterolemia is a critical modifiable cardiovascular (CV) risk factor. European Society of Cardiology guidelines stress the importance of timely CV risk identification (ESC-SCORE2) and rapid achievement of the LDL-C therapeutic target, especially in apparently healthy individuals aged 40–69. However, therapeutic inertia and poor patient compliance remain major barriers in primary care.

Objectives: To evaluate the effectiveness of a proactive CV risk management protocol in general practice, integrating immediate LDL-C measurement via capillary POCT. The primary objective was to increase the percentage of at-risk patients (aged 50–69) achieving the ESC-SCORE2 LDL-C target. The secondary goal was to quantify the specific role of POCT in reducing physician inertia and optimizing patient adherence compared to conventional venous blood sampling.

Methods: 230 apparently healthy patients (50–69 years), identified from electronic records as not at target LDL-C level, were enrolled. After an initial counseling session on lifestyle, they were invited to monitor their lipid profile after 6 months.

Results: At follow-up, only 95 patients (41.3%, Group A) completed the standard central laboratory monitoring, which showed no statistically significant change in mean LDL-C. Non-compliant 135 patients (Group B) were recalled for immediate metabolic parameter reassessment using capillary POCT in the medical office. 105 (77.8%) adhered to this invitation. A significant increase in monitoring adherence was observed (POCT Adherence = 77.8% vs. Standard Adherence = 41.3%). The mean LDL-C levels in this group did not show a significant variation compared to baseline. However, following the immediate POCT feedback, 25% of these patients immediately started lipid-lowering therapy or intensified lifestyle counseling.

Discussion: CV risk management protocol integrating immediate POCT measurement significantly improved patient compliance with reassessment, nearly doubling adherence (77.8% vs. 41.3%) compared to the conventional monitoring pathway. This highlights POCT as a valuable proactive healthcare tool for reducing testing inertia and re-engaging non-compliant patients.

Conclusion: Nevertheless, the lack of statistically significant changes in mean LDL-C levels in both groups suggests that monitoring alone (standard or POCT), without immediate triage and initiation or intensification of pharmacological therapy, is insufficient for effectively and rapidly achieving the primary prevention ESC-SCORE2 targets.

ID 1245- Familial Hypercholesterolaemia in a Young Female Presenting with Xanthelasma: Clinical Management, Family Screening, and Applicability of ESC Guidelines in Low-Resource Settings

Hasara KULATUNGA

Senior Registrar In Family Medicine, Colombo, Sri lanka

Context: Familial Hypercholesterolaemia (FH) is an autosomal dominant lipid disorder associated with lifelong elevated LDL cholesterol and premature atherosclerotic cardiovascular disease (ASCVD). Recognition remains low in South Asia despite high cardiovascular risk. A 29-year-old Sri Lankan garment-factory worker presented with bilateral xanthelasma and a markedly elevated LDL-cholesterol level, raising suspicion of FH. Her socioeconomic and occupational constraints highlighted the need for practical, personalised management within a lower-middle-income healthcare system

Methods: Diagnosis was guided by the ESC/EAS dyslipidaemia guidelines and Dutch Lipid Clinic Network criteria, consistent with probable FH. Given her reproductive age, a culturally sensitive sexual and contraceptive history was obtained prior to initiating high-intensity statin therapy, recognising taboos surrounding premarital sexual activity in the region. Cascade screening was arranged for her three younger sisters. A personalised lifestyle plan was developed to accommodate her 12-hour workdays, seven-day work weeks, and limited capacity for structured exercise. Recommendations included walking to work, carrying home-prepared meals for breakfast and lunch and avoiding workplace snacks.

Originality: Initiating high-dose statins in reproductive-age women, requiring sensitive counselling around contraception and sexual health in a culturally conservative setting. Applying ESC guideline-based treatment in a healthcare system where access to ezetimibe a

Lessons learned and future implication: Culturally sensitive reproductive counselling is essential before statin initiation. Personalised lifestyle plans must reflect real socioeconomic and occupational barriers. Strengthening cascade screening and improving access to second-line agents could e

Discussion: In resource-limited settings, high-intensity statins remain the most practical first-line therapy for FH. Recognising xanthelasma as a clinical marker facilitates early diagnosis. Creative lifestyle interventions aligned with patient realities can significantly complement pharmacotherapy

Conclusion: .This case illustrates effective, context-appropriate application of ESC FH guidelines through early clinical recognition, sensitive reproductive counselling, high-dose statin therapy, and family screening. It demonstrates how personalised care can meaningfully reduce long-term ASCVD risk even when advanced therapies are inaccessible.

ID 749- Disparities in Lipid Lowering Therapy Uptake in High Risk Primary Prevention Patients vs Secondary Prevention Patients in Primary Care in the UK

Meredith DONALDSON, Carl DEANEY

Marsh Medical Practice, Louth, Royaume-Uni

Context: Statin therapy remains a key intervention to reduce atherosclerotic cardiovascular disease (ASCVD) risk in both primary and secondary prevention patients.1 However, real-world initiation of lipid-lowering therapy (LLT) is lower in primary prevention populations, despite guideline recommendations.2 Moreover, adherence inequities exist by socioeconomic status, with evidence that individuals in deprived areas are particularly likely to have suboptimal statin use.1

Objectives: To compare LLT prescribing rates in high-risk primary prevention (no recorded cardiovascular disease, QRISK ≥ 10% (In the UK, high-risk primary prevention patients are defined as those with a QRISK3 score ≥10%, indicating a predicted 10-year cardiovascular risk ≥10% and representing the NICE-recommended threshold for offering statin therapy for primary prevention versus secondary prevention (recorded CVD) patients using data from the CVD Prevent audit.

Methods: Data was analysed from the CVD Prevent audit, defining two cohorts: (1) primary prevention: patients with QRISK ≥ 10% and no GP-recorded CVD; (2) secondary prevention: patients with GP-recorded CVD. Performance was evaluated using CVD PREVENT (June 2025), focusing on the proportion of patients in each cohort currently

prescribed LLT in our practice, across our Primary Care Network (PCN), and nationally.

Results: Primary prevention (QRISK ≥ 10%, no CVD): Our practice, 77.06%; PCN, 56.18%; national, 55.90%. Secondary prevention (GP-recorded CVD): Our practice, 94.99%; PCN, 86.08%; national, 85.41%.

Discussion: While our practice outperformed both local and national averages in both groups, there remains a substantial gap in LLT uptake between primary and secondary prevention.

Conclusion: These findings highlight a persistent treatment disparity: secondary prevention patients are considerably more likely to be prescribed LLT than high-risk primary prevention patients, even though guidelines support proactive initiation in both settings. Targeted efforts to bridge this gap could optimise ASCVD risk-reduction efforts and improve patient outcomes.

Corresponding author: Meredith Donaldson, meredith.donaldson@nhs.net

ID 214- Evolution of Hypolipidemic Drug Consumption in France from 2012 to 2022: Impact of European Society of Cardiology Guidelines

David DE BANDT [(1)] , Antoine GUEZ [(1)], Isabelle CATALA [(2)], Sophie PONDAVEN [(1)]

(1) Versailles Saint Quentin University, Versailles Saint Quentin, France
(2) Hôpital Mignot, Le Chesnay, France

Context: The use of hypolipidemic drugs in cardiovascular prevention has evolved in France over the past decade. The European Society of Cardiology (ESC) issued updated guidelines on dyslipidaemia in 2019, introducing stricter LDL-cholesterol targets. This study assessed the impact of the 2019 ESC guidelines for the management of dyslipidaemias on hypolipidemic drugs sales.

Objectives: The objective is to understand the kinetics of hypolipidemic drug sales over the past decade in France and to identify the factors influencing these sales. More broadly, this study is part of a wider effort to understand the impact of clinical guidelines on drug sales. A secondary objective is to understand the public expenditure generated by hypolipidemic drug sales in order to better control public health spending.

Methods: This ecological study reviewed hypolipidemic drug sales in France from January 2012 to December 2022 using the Medic'AM database. For each class of hypolipidemic drugs, the monthly average of defined daily dose per thousand inhabitants per day (DDD/TID) was calculated. Autoregressive model analysed sales trends prior and after ESC guidelines publication date.

Results: Average monthly sale of hypolipidemic drugs decreased from 110.139 in 2012 to 97.297 DDD/TID in 2018. Following the publication of the 2019 ESC guidelines, a significant reversal of this trend was observed, reaching 123.506 DDD/TID in 2022, representing an excess of 788.823 DDD/TID sold. Yearly associated healthcare expenses decreased from 2012 to 2018, then increased from 699.739 million euros to 830.004 million euros in 2022.

Discussion: After the publication of the 2019 ESC guidelines for the management of hyperlipidaemias, an increase in hypolipidemic drug consumption was observed in France, particularly for atorvastatin and ezetimibe. This trend may have been driven by multiple factors, such as public health policies, practitioners' prescribing habits, patients' perceptions, or industrial lobbying. Healthcare costs have risen, particularly due to the increased sales of ezetimibe, which is more expensive third-line treatment.

Conclusion: The 2019 ESC guidelines for the management of hyperlipidaemias are associated with an increase in hypolipidemic drug consumption and related costs in France. Multiple co-factors could be contributing to this rise. Practice-based studies are needed to better understand the determinants of the increase in prescriptions.

ID 31- STRIKE LDL : Systematic review Targeting Recommendation In young

adults for Knowledge on Early LDL screening

Marion GOUTTE [(1)] , Noémie CHAUZY [(1)], Elodie CHARUEL [(2)]

(1) Department Of General Practice, Ufr Medicine And Paramedical Professions, Université Clermont Auvergne, Clermont-Ferrand, France., Clermont-Ferrand, France
(2) Department Of General Practice, Ufr Medicine And Paramedical Professions, Université Clermont Auvergne, Clermont-Ferrand, France. Université Clermont Auvergne, Ur Acceppt, Clermont-Ferrand, France.maison De Santé Pluriprofessionnelle Universitaire Les Batignolles (mspu), Joze, France., Clermont-Ferrand, France

Context: Cardiovascular diseases remain a leading cause of global mortality, largely driven by modifiable risk factors. Although prevention is central to primary care, most cardiovascular risk assessment tools, such as SCORE2, are not validated before 40 years, despite evidence that atherosclerosis begins much earlier. In clinical practice, lipid testing is frequently performed in young adults despite the absence of clear guidelines. This discrepancy raises key questions in general practice regarding screening relevance, clinical benefit, and quaternary prevention.

Objectives: To identify and synthesize international recommendations on LDL cholesterol testing for primary prevention in healthy adults aged 18 to 40 years.

Methods: A systematic literature review was conducted following PRISMA guidelines. International recommendations in English or French addressing dyslipidemia screening were included. Data extraction focused on target populations, screening criteria, risk factors, and assessment tools. The review protocol was registered on PROSPERO.

Results: Twenty-six recommendations published between 2008 and 2023 were analyzed. More than one quarter (26.9%) did not mention individuals under 40 years. Only 30.8% recommended LDL testing in individuals without risk factors, while 69.2% supported testing in the presence of risk factors or comorbidities, with considerable variability in criteria. Two recommendations, including that of the European Society of Cardiology, explicitly discouraged testing in the absence of identified risks. Only 7.7% defined a “healthy” population, and 34.6% proposed a risk score adapted to this age group.

Discussion: Strengths include rigorous methodology and international scope, while heterogeneity and variable guideline quality limit direct comparisons. Consistent with prior reviews, this heterogeneity reflects both limited evidence and uncertainty about long-term benefits of early screening in primary care.

Conclusion: Recommandations on LDL testing in young adults are fragmented and poorly adapted to general practice. This review supports a pragmatic, ethical, and targeted approach to LDL testing to strengthen early cardiovascular prevention among young adults.

ID 2286- EHR training for GP resident in Belgium

Benjamin FAUQUERT [(1)] , Marie-Eve JANSSEN [(2)], Michel DE JONGHE [(3)]

(1) Université Libre De Bruxelles, Brussels, Belgique
(2) Université De Liège, Liège, Belgique
(3) Université Catholique De Louvain, Brussels, Belgique

Context: Since Lawrence Weed publications and trainings, maintaining a problem list is a goal for healthcare quality and a core competence of every physician, especially general practionners. It allows to manage multimorbidity and polymedication. This is also particularly important to ensure continuity of care in the current era of chronic disease and summary care record (called SumEHR in Belgium) sharing. But in routine practice, GPs face many pitfalls to obtain a usable problem list: no use of controlled vocabullary, absence of relevant value date, problem duplicates, management of differential diagnosis... In 2019 and 2020, regional reporting shows that SumEHR are not published for every patient and are of uneven quality.

Objectives: The aim of this work was to set up training to learn how to manage a problem list for GP during their first year of residency (postgraduate).

Methods: The quality of the training was assessed each year through quantitative questionnaires with likert scales and comments from trainers.The training is hosted by the Walloon e-health training platform, which is based on Moodle.

Results: In 2021, teachers responsibles for medical informatics in the three (and four since 2024) French-speaking belgian universities decide to set up a joint course. Currently, this annual online course provides training for 273 GP residents, with 15 GP trainers. The course is based on exercises in small groups according to the EHR software that residents use at their internship workplaces. The main aim of the training is to learn how to clean up problems list with their own EHR software in order to publish a SumEHR. Despite the different undergraduate curricula and software limitations, in 2025, 60.5 % are satisfied or very satisfied with the "clean-up exercise". 69,9% (2024) and 62.2% (2025) had not published any Sumehrs prior to the training.

Discussion: Satisfaction with this training can still be improved in terms of the fluidity of the exercises and consistency between groups. Although generative AI transcription features are becoming widely available in EHRs, maintaining an up-to-date list of issues remains a complex clinical skill that involves technical tasks and clinical reasoning.

Conclusion: Future developments towards a blended learning format are planned.

(2) Investigation Support Multidisciplinary Unit For Primary Care And Community North Area Of Madrid.instituto De Investigación Sanitaria Gregorio Marañón, Madrid, Espagne
(3) Who Regional Office For Europe - Copenhague (Denmark), Copenhague, Danemark
(4) University Of Exeter, Exeter, Royaume-Uni
(5) Department Of Family Medicine And Population Health, Faculty Of Medicine And Health Sciences, University Of Antwerp, Antwerp, Belgique
(6) School Of Medicine, Keele University, Newcastle, Newcastle, Royaume-Uni
(7) Saarland University, Homburg, Homburg, Allemagne
(8) Who Regional Office For Europe, Copenhague, Danemark
(9) Center For Health Sciences Education, Aarhus University, Aarhus, Danemark
(10) European Alliance For Primary Care Workforce Development, Brussels, Belgique

Context: Postgraduate training for General Practice (GP) / Family Medicine (FM) is essential for strong primary care systems, yet its organisation varies widely across the WHO European Region. To support workforce development, comparability, and policy planning, a European collaborative project was launched to map and describe GP/FM postgraduate training.

Objectives: To systematically collect and compare national GP/FM postgraduate training programmes, focusing on training time, access requirements, governance, structure, rotation schemes, educational methods, and evaluation procedures.

Methods: A cross-sectional descriptive study was carried out. Family doctors and trainees were recruited through WONCA Europe networks and WHO Europe as key informants. Each country was asked to submit its official curriculum and a validated dataset prepared jointly by the key informants. Two members of the research team reviewed and verified the submitted information, contacting informants for clarification as required. At the time of interim analysis complete data were available from 23 countries, with 83 key informants from 41 countries confirmed to participate.

Results: Across the 23 countries analysed, the duration of GP/FM postgraduate training varied from two to six years, most commonly four. Governance differed considerably: national authorities managed training in 14 countries, universities in 10, and medical chambers or GP/FM associations in six, with shared responsibility in seven. Entry pathways also varied, involving national or university exams (10 countries), interviews (12 countries), curriculum vitae (11

countries), motivation letters (7 countries), and local language proficiency requirements between B1 and C1 level (6 countries). Training was predominantly practice-based, with an overall distribution of 85% practical and 15% theoretical learning. Fixed rotation schemes were used in 19 countries and consistently combined hospital-based rotations with a longer period in FM settings. Evaluation methods were diverse: 17 countries required a final exam, frequently including written, oral, and practical components. Scientific activities such as a thesis, research project, or publication were mandatory in 10 programmes.

Discussion: These preliminary findings highlight the need for improved comparability and shared frameworks to support high-quality GP/FM training and primary care strengthening across the region.

Conclusion: GP/FM postgraduate training is well established across Europe but highly heterogeneous in structure, access requirements, governance, and evaluation.

ID 1082- Pilot Findings from a Needs Analysis Among Medical Students and Teachers in General Practice

Lisa NIEHOFF [(1)] , Erika ZELKO [(1)], Zalika KLEMENC-KETIŠ [(2)], Uros ZAFOSNIK [(2)], Bohumil SEIFERT [(3)], Norbert KRÁL [(3)]

(1) Institute Of General Practice, Jku Linz, Linz, Autriche
(2) Ljubljana Community Health Care Centre, Ljubljana, Slovénie
(3) Institute Of General Practice 1st Faculty Of Medicine, Charles University In Prague, Prague, Tchèque, république

Context: Virtual Reality (VR) as an educational tool offers immersive, experiential learning that can strengthen clinical reasoning, patient-centered communication, and teamwork competencies central to general practice. However, evidence on how to integrate VR meaningfully into undergraduate family medicine curricula remains limited. Understanding learners' and teachers' expectations, perceived value, and practical needs is essential for effective curriculum integration.

Objectives: The primary objective is to identify students' and teachers' educational needs, attitudes, and anticipated benefits regarding VR-supported teaching in general practice. A secondary objective is to determine potential barriers and institutional prerequisites for successful implementation.

Methods: A pilot cross-sectional online survey will be conducted in January 2026 at three European medical faculties. Two structured, anonymous questionnaires—one for students and one for educators—will assess prior VR experience, preferred primary care learning scenarios, expected learning outcomes, usability and didactic requirements, and perceived implementation challenges. The instruments include Likert-scale, multiple-choice items, and open-ended questions. Quantitative data will be analyzed descriptively, while qualitative responses will be analyzed thematically to identify shared priorities across stakeholder groups. This mixed-methods approach ensures a comprehensive understanding of educational needs and feasibility.

Results: (anticipated): The pilot will establish the feasibility, reliability, and content validity of the survey instruments, assess response trends, and identify key thematic categories. Students and teachers are anticipated to value VR for enhancing clinical reasoning, patient-centered communication, and interprofessional collaboration. Participants will likely emphasize the need for realistic scenarios, structured guidance, and meaningful feedback. Barriers may include limited equipment access, motion sickness, technical challenges, and questions of feasibility within dense curricular.

Discussion: (anticipated): By systematically mapping how students and educators conceptualize VR in general practice education, this methodological phase will clarify the pedagogical expectations, perceived relevance, and logistical constraints of immersive technologies in undergraduate medical training. These insights will inform curriculum development and institutional planning, ensuring subsequent study phases are grounded in empirically derived stakeholder needs.

Conclusion: This methodological framework provides a structured approach to exploring how VR can address educational needs in general practice training. The results will guide evidence-based development of VR modules and define institutional

and pedagogical conditions necessary for sustainable integration of immersive learning into primary care education.

ID 1050- Simulation Based Education and the discursive Demands of Assessment

Kartal UÇAR, Monique HECTORS, Karin KAASJAGER

Schola Medica, Utrecht, Pays-Bas

Context: Simulation-based education (SBE) is widely recognized as an effective method for training healthcare professionals, providing realistic scenarios supported by trained actors and authentic medical tools. However, despite this practical fidelity, the discursive demands placed on participants often diverge from everyday clinical practice. Participants must verbalise reasoning, explicitly introduce medical information that would normally arise naturally, and articulate thought processes that typically remain internal. These requirements may shape how competence is displayed and evaluated in ways not yet fully understood.

Methods: Data were collected during education of GP in training involving simulation encounters between general practice trainees and trained assessors. Using conversation analysis (CA), we recorded and analyzed the interactional practices through which participants introduced medical information, displayed clinical reasoning, and responded to prompts. Particular attention was given to moments where trainees needed to introduce “unassimilable” information, details not typically elicited by patients in real

Originality: This study aims to examine the discursive dynamics of simulation-based assessments in general practice training, focusing on how GP in training and assessors jointly construct simulation encounters and how these practices influence the visibility and inte

Lessons learned and future implication: Analysis revealed several strategies for introducing unassimilable medical information. When GPs in training independently introduced this information, assessors gained more complete access to their clinical reasoning, supporting more valid competence jud

Discussion: While previous research has examined fidelity and authenticity in SBE, little attention has been given to the discursive work required to sustain simulated interactions. This study identifies discursive load as an overlooked factor that directly shapes performance and assessment in simulation contexts.

Conclusion: Addressing the discursive features of SBE can strengthen educational value and validity, contributing to more meaningful and reliable evaluation practices in GP training.

ID 553- Defying uncertainty: first-year medical residents´experience in the emergency department at a regional hospital.

María Nieves VELA MORENO [(1)] , Ana Margarida PEREIRA DE SOUSA E SILVIA [(2)], Antonio GUERRERO LÓPEZ [(1)], Maria DOTOR LAVADO [(3)], Viviana Paola MENDOZA ORTIZ [(2)], Leticia BELTRAN NASH [(2)]

(1) Urbano I, Primery Care Center; Servicio Extremeño De Salud, Mérida, Espagne
(2) Urbano Iii, Primery Care Center; Servicio Extremeño De Salud, Mérida, Espagne
(3) Mérida Hospital, Servicio Extremeño De Salud, Mérida, Espagne

Context: Emergency departments are high-pressure settings with heavy workloads, shifts, and diverse case complexity. These factors impair cognitive performance, increase stress and fatigue, and amplify clinical uncertainty—particularly among first-year residents (R1s) who combine limited experience with demanding on-call duties. This study was conducted in a 265-bed hospital over two months to capture presentations and R1s’ self-reported uncertainty during shifts.

Objectives: Describe pathologies managed by R1s during emergency on-call shifts and quantify

perceived clinical uncertainty by presentation. Also, assess variation in uncertainty by patient age and sex, shift hour and day type, diagnostic category and severity, and between individual residents; identify implications for training, supervision, and organization.

Methods: Cross-sectional observational study (12 February–31 March 2025). Five R1s (four Family and Community Medicine, one Internal Medicine) prospectively recorded 555 consecutive emergency encounters across 58 days. For each case they logged demographics, triage complaint, final diagnosis, disposition, and a self-rated uncertainty score (0–10), categorized as low (≤3), moderate (4–6), or high (≥7). Diagnoses were grouped into nine clinical categories and stratified by severity. Descriptive statistics and crude odds ratios with 95% confidence intervals were calculated.

Results: Mean uncertainty was 5.4 (SD ±2.7); 46.1% of encounters were rated high (≥7). Digestive, respiratory, and musculoskeletal presentations were significantly associated with higher uncertainty ($p < 0.05$), with some crude ORs >2.4. Adults (14–75 years) had higher odds of high uncertainty than pediatric patients (OR 1.745; 95% CI 1.067–2.854). No significant differences by patient sex or weekday versus holiday shifts were found. Substantial interindividual variability existed among residents.

Discussion: Clinical uncertainty among R1s is common and largely subjective. Higher uncertainty in specific diagnostic groups likely reflects presentation heterogeneity and diagnostic complexity; greater uncertainty with adults may stem from broader differentials and fewer standardized protocols. Personal factors and prior experience influence variability. Limitations include single-center scope, timeframe, a non-validated uncertainty scale, and a small number of raters.

Conclusion: R1s frequently face high clinical uncertainty in emergency care. Programs should implement targeted diagnostic reasoning training, structured supervision, and organizational reforms to support residents and safeguard care quality. Future research should validate measurement tools and evaluate interventions longitudinally.

ID 255- How to fulfil potential? A review of GP Trainee Leadership development in Wessex, UK

Josephine CASSELL, Janet MCGEE, Jonathan RIAL

Nhs England, New Horizons Medical Partnership, Southampton, Royaume-Uni

Context: UK General Practice training takes 3 years, including a portfolio of Workplace Based Assessments. Trainees must complete a Leadership Activity and a Leadership Multi-Source Feedback in their final year. Recent government funding has lead to an increase in non-doctor staff in primary care. GPs immediately after qualification are expected to supervise those roles, and we wanted to explore how our trainees can be best supported to feel confident as new leaders.

Objectives: To answer the question “to what extent do trainees and trainers believe the current local and national leadership training curriculum helps trainees develop confidence and a clear sense of themselves as leaders?”.

Methods: A mixed-method approach including a survey to GPs, a review of local teaching and collation of 6 months of Leadership Activity assessments.

Results: Of the survey responses, the majority agreed that leadership skills are “important” or “very important”, but none felt the current portfolio requirements fully prepares trainees. All but one trainee did not think they had received any formal leadership training, despite confirming this was being provided. Only 24% were aware of leadership toolkits/resources, with only 35% of trainees having had opportunities to engage with leadership roles. 118 leadership activities were completed in 6 months. 51% had a clinical or teaching focus with relatively few focusing on non-clinical practice management.

Discussion: Despite recognition of the importance of leadership skills, trainees report feeling unprepared. They do not feel the current curriculum supports them to fulfil their leadership potential, and trainees/trainers either do not understand the current assessments or are not utilising them effectively. There is a lack of awareness of local

teaching, toolkits/resources and opportunities to engage with local leadership. We suggest improved signposting to existing resources, and facilitating trainees to access practical leadership experience.

Conclusion: There is a disconnect between the perceived importance of GP leadership skills, and the ability of the current training programme to develop these. Work needs to be done to make the assessments fit for purpose. We need to inspire our trainees to move beyond the "safe sphere" of clinical management and utilise existing resources to fulfil their individual leadership potential.

ID 88- Experiences of General Practice Supervisors Facing Uncertain Validation of Residents: A Qualitative Study

Isabelle ETTORI, Alice LE GRAET

Université De Tours, Tours, France

Context: During ambulatory general practice placements, clinical supervisors play a key role in identifying and supporting residents experiencing difficulties. When a resident's validation becomes uncertain, supervisors face tensions between their dual roles as mentors and evaluators, with limited literature exploring their lived experience in such situations.

Objectives: To explore the experiences of general practice supervisors facing residents in difficulty and uncertainty about stage validation, and to identify factors influencing their experience.

Methods: A qualitative study was conducted in XXX. Semi-structured face-to-face interviews were performed with general practice supervisors who had supervised at least one resident in difficulty. Interviews were transcribed verbatim and anonymised. Data were analysed using an interpretative phenomenological approach. Recruitment continued until data sufficiency.

Results: Eight interviews were analysed. Supervisors reported early intuitive detection of resident difficulties, often within the first weeks. Difficulties were multifactorial (clinical knowledge gaps, relational issues, professionalism concerns, psychological vulnerability). They first sought direct discussion with the resident, then collegial exchange within the supervisory team, and finally support from the university department when needed. Two profiles emerged. Empathic supervisors showed strong emotional involvement, greater stress and self-questioning, and a tendency to prioritise support over assessment. Protocol-oriented supervisors relied more on objective criteria, maintaining emotional distance and reporting less distress when issuing a negative evaluation. Positive resident progression and institutional support improved supervision experience, whereas lack of collaboration or institutional backing was associated with feelings of isolation or failure.

Discussion: Uncertain validation situations are emotionally demanding for general practice supervisors, particularly for those with strong relational investment. Collegial evaluation, supervisor support networks, and training in pedagogical decision-making and emotional regulation may help mitigate distress and promote fair, learner-centred evaluation. Single-region recruitment and a small sample limit transferability. Self-selection bias and absence of double coding may have influenced interpretation. Most cases involved first ambulatory placements, limiting insight into end-of-training contexts.

Conclusion: Supporting general practice supervisors in their evaluator role and addressing emotional challenges could enhance the evaluation process and contribute to safer, fairer medical training. Including hospital supervisors in future work would provide a broader perspective on supporting residents in difficulty.

ID 1750- Systematic review of clinical trials on the efficacy of medical cannabis in the management of chronic pain

Minh Huong NGUYEN, Lucas BEURTON-COURAUD

Faculté De Médecine De Brest, Brest, France

Context: Chronic pain is a therapeutic challenge because of its complexity. Medical cannabis is amongst potential analgesic treatments.

Objectives: This systematic review aimed to study good-quality randomized controlled trials (RCT) on the effectiveness of medical cannabis in the management of chronic pain and observational studies to evaluate side effects.

Methods: The search for RCTs was carried out on Pubmed/Medline, Cochrane and Embase. Biases in the RCTs were assessed using RevMan5 software. Only RCTs with at least three low-risk criteria were included in the final qualitative analysis. Observational studies have been used to evaluate adverse effects (AEs) of medical cannabis.

Results: There were 24 RCTs and 13 observational studies included in this review. The effectiveness of medical cannabis was shown in 11/14 RCTs on neurological pain and in 3/7 RCTs for other pathologies. Pain was not reduced significantly in 2/3 RCTs on cancer pain. AEs were observed more frequently in the group treated with medical cannabis. The most common AEs included somnolence, dizziness, nausea, dry mouth.

Discussion: There was weak to moderate evidence for the effectiveness of cannabinoids in the treatment of chronic non-cancer pain, primarily for neurologic pain. There was a lack of evidence on the superiority of medical cannabis compared to placebo in the treatment of cancer pain. AEs occurred more frequently in the medical cannabis group. A standardized outcome measure was lacking to allow for a more effective evaluation.

Conclusion: More robust RCTs with longer follow-up will be required to clarify the effectiveness of medical cannabis in the management of chronic pain.

ID 1572- Glucagon-like peptide-1 receptor agonists and liver-related outcomes in adults with viral hepatitis and type 2 diabetes: a real-world evidence study

Yu-Ting YU [(1)] , Hsiao-Yen KANG [(2)], Huan-Cheng CHANG [(2)], Sheng-Ping CHEN [(3)], Chin-Hsiang LO [(2)], Ming-Hsien TSAI [(4)]

(1) Landseed International Hospital-Taoyuan City (taiwan, Republic Of China), Taoyuan City, Taïwan, République de Chine
(2) Landseed International Hospital - Taoyuan City (Taiwan, Republic of China), Taoyuan City, Taïwan, République de Chine
(3) Landseed International Hospital, Taoyuan City, Taïwan, République de Chine
(4) Shin-Kong Wu Ho-Su Memorial Hospital - Taipei City (Taiwan, Republic of China), Taipei City, Taïwan, République de Chine

Context: Chronic viral hepatitis combined with type 2 diabetes substantially increases the risk of progressive liver disease, hepatic decompensation, and early mortality. Recent large-scale observational studies suggest that glucagon-like peptide-1 receptor agonists (GLP-1 RAs) may be associated with reduced serious liver events in metabolic liver disease, yet evidence specific to viral hepatitis remains limited. Understanding real-world outcome patterns may help inform therapeutic decisions in primary care.

Objectives: To evaluate associations between GLP-1 RA use and liver disease progression, all-cause mortality, and hospitalization in adults with viral hepatitis and type 2 diabetes, using dipeptidyl peptidase-4 inhibitors (DPP-4is) as an active comparator.

Methods: A retrospective active-comparator, new-user cohort study was conducted using the TriNetX Global Health Research Network. Adults ≥18 years with viral hepatitis and type 2 diabetes recorded between January 1, 2010, and December 31, 2024, were included. Individuals with prior advanced liver disease, including cirrhosis, hepatic decompensation, portal hypertension, or hepatocellular carcinoma were excluded. New users of GLP-1 RAs and dipeptidyl peptidase-4 inhibitors (DPP-4is) were matched 1:1 using propensity scores incorporating demographics, comorbidities, antiviral and metabolic medication exposures, and laboratory parameters. Outcomes were assessed up to 5 years after treatment initiation. The primary endpoint was a composite of advanced liver events;

secondary endpoints were all-cause mortality and inpatient or observation encounters. Cox proportional hazards models estimated associations.

Results: After matching, 8,384 patients were included per cohort. GLP-1 RA therapy was associated with a lower incidence of advanced liver events (hazard ratio [HR] 0.79; 95% confidence interval [CI] 0.74–0.84; p < 0.0001), all-cause mortality (HR 0.59; 95% CI 0.54–0.65; p < 0.0001), and hospital utilization (HR 0.75; 95% CI 0.71–0.79; p < 0.0001). Absolute risk differences were consistent across endpoints.

Discussion: Observed associations align with emerging evidence that GLP-1 RAs may exert hepatoprotective effects through metabolic, anti-inflammatory, and antifibrotic pathways, particularly in individuals with concurrent metabolic disease.

Conclusion: In adults with viral hepatitis and type 2 diabetes, GLP-1 RA use was statistically associated with fewer advanced liver events, lower mortality, and reduced hospitalization compared with a DPP-4i comparator, providing real-world insights relevant to primary care decision-making.

ID 1480- Electric Silence, Genetic Noise: The Critical Role of Preconception Consultation – A Case Report

Joana ESTORNINHO, Alexandre SANTOS

Uls Lisboa Ocidental, Lisboa, Portugal

Context: Epilepsy affects 0.3–0.5% of women of reproductive age. While sodium valproate (VPA) and topiramate are effective for seizure control, they pose significant teratogenic risks. Safer alternatives exist for women planning pregnancy, making preconception consultation essential to optimize therapy, promote healthy habits, and ensure timely referral, reducing adverse obstetric outcomes.

Methods: This case report was developed through a retrospective review of clinical records and patient interviews. The timeline of events, therapeutic interventions, and outcomes were analyzed to identify critical points in care delivery. Literature on epilepsy management during pregnancy and preconception counseling was consulted to contextualize findings.

Originality: The case illustrates the intersection of pharmacological risk, systemic delays, and the family physician's role in mitigating adverse outcomes. It emphasizes how failure to meet guaranteed response times (TMRG) and lack of preconception planning can lead

Lessons learned and future implication: Early Identification: Family physicians must proactively address teratogenic risks in women of reproductive age. Referral Pathways: Strengthening triage systems and ensuring compliance with TMRG is essential to avoid delays. Patient Education: Preconcepti

Discussion: We report the case of a 31-year-old hospital support worker, smoker (20 pack-years), G4P1A3, with idiopathic epilepsy treated with VPA and topiramate. In August 2022, she presented with a desired but unplanned pregnancy (4–5 weeks) while on teratogenic therapy. Despite urgent referrals and medication adjustment to lamotrigine, specialist follow-up was delayed beyond TMRG. The pregnancy was complicated by gestational diabetes, high-risk screening for trisomy 18, and fetal cardiac anomalies, culminating in intrauterine fetal demise at 17 weeks. In 2023, after appropriate preconception counseling, she conceived again, with an uneventful pregnancy and delivery.

Conclusion: This case highlights the intersection of pharmacological risk, systemic delays, and the FP's pivotal role in mitigating adverse outcomes. Preconception consultation is a cornerstone of safe maternal care in women with epilepsy. Embedding this practice in primary care and improving referral systems are critical to achieving favorable outcomes in high-risk pregnancies.

ID 1322- Impact of tramadol and codeine secured prescriptions on national analgesic dispensing in France

Matthieu DESCHAMPS [1] , Célia REGAL-MEZIN [2]

(1) Département Universitaire De Médecine Générale (dumg), Aix-Marseille Université, Marseille, France
(2) Aix-Marseille Université, Marseille, France

Context: Analgesics are among the most widely used medications in France, and their prescription is closely monitored by national health authorities. In recent years, the marked increase in tramadol and codeine use has raised concerns within addiction and pharmacovigilance networks due to their documented potential for misuse, dependance, and adverse effects. In response, new national regulations now require these medications to be prescribed on secured prescription forms. We hypothesize that this reform will have far-reaching repercussions on overall analgesics use in France.

Objectives: The primary objective of this ongoing study is to assess the impact of secured prescription requirements on tramadol, codeine, and dihydrocodeine dispensing. Secondary objectives are to evaluate potential shifts in the prescribing of other analgesics and to estimate the resulting impact on healthcare expenditures.

Methods: This ongoing descriptive and retrospective study uses the French national health insurance open database Médic'AM to conduct an epidemiological analysis of nationwide monthly dispensing in pharmacies. The analysis includes reimbursed medications recommended by the Haute Autorité de Santé (HAS) for acute, chronic and neuropathic pain. Data are converted into Defined Daily Dose and analyzed using a segmented regression model to compare trends before, during, and after the implementation period, from January 2023 to December 2025.

Results: Our preliminary findings suggest substantial changes in prescribing practices, including an early decrease in tramadol, codeine and dihydrocodeine dispensing. In reaction, a compensatory increase in other analgesic dispensing is expected. Final results and statistical analysis will be conducted once all 2025 data are available.

Discussion: Our study highlights the impact of national regulatory reforms on analgesic prescribing. This impact should be interpreted in light of each drug's clinical indications. Only limited effects are expected on antidepressant and antiepileptic dispensing, as tramadol is a second-line option for neuropathic pain. Likewise, changes in strong opioid prescribing are expected to be minimal, as these medications were already subject to secure-prescriptionrequirements.

Conclusion: This study will help assess the effectiveness and economic implications of a nationwide reform based on prescribing restrictions, therefore guiding future public health policy. Our results will also pave the way for further studies on misuse and medication safety.

ID 938- Improving serum magnesium monitoring in patients prescribed high-dose proton pump inhibitors in primary care: a two-cycle quality improvement project

Destina YILDIRIM

University Of East Anglia, Norwich, Royaume-Uni

Context: High-dose proton pump inhibitors (PPIs) are associated with hypomagnesaemia, which can lead to complications such as arrhythmias, seizures and hospitalisation. Despite recommendations from NICE guidelines to monitor magnesium in these patients, baseline auditing within a large primary care practice in the UK (October 2023-October 2024) demonstrated suboptimal compliance, with only 78.9% of patients on high-dose PPIs having serum magnesium measured, with no identification of higher-risk individuals. This prompted recommendations for clinician education and implementing a recall system.

Objectives: To evaluate whether serum magnesium monitoring improved one year after the initial audit and to assess whether higher-risk patients (on diuretics, digoxin, or with high alcohol intake) were being identified on SystmOne. The primary objective was to assess improvement towards the 100% annual monitoring standard.

Methods: A re-audit was conducted using SystmOne (November 2024-November 2025). All patients prescribed high-dose omeprazole or esomeprazole (40mg daily) were included. Data collected included PPI compliance, serum magnesium measurement within 12 months, presence of higher-risk factors and evidence of a recall system. Descriptive statistics were utilised and findings were compared with baseline results.

Results: 302 patients were prescribed high-dose PPIs (Cycle 1: 298). Of these, 235 had a serum magnesium measured within the last year (77.8%), showing no improvement from Cycle 1 (78.9%). 67 patients lacked a magnesium measurement, 54/67 were compliant with treatment. 13 compliant patients were higher-risk, 12/13 (92.3%) had undergone other blood tests in the last year - indicating missed opportunities to add magnesium. No recall system had been implemented, and higher-risk identification remained 0%.

Discussion: The lack of improvement highlights the challenges of translating findings into clinical change, and importantly the value of student-led audits. While they successfully identify gaps in care, meaningful change often requires system-level changes beyond the original audit. This provides a valuable opportunity to reflect on the real-world impact and limitations of student audit work within primary care.

Conclusion: Magnesium monitoring in high-dose PPI patients did not improve, underscoring the need for automated prompts or recall systems. The findings also highlight that even when change is not achieved, student audits can generate important insights to guide improvements. Further re-audit is recommended following implementation.

Corresponding author: Destina Yildirim, destinayildirim2@gmail.com

ID 54- A Feasibility Randomized Controlled Superiority Trial of Fluticasone-Vilanterol Once Daily Use for the Treatment of Mild Asthma in Adults

Ghufran JASSIM

Royal College Of Surgeons In Ireland Medical University Of Bahrain, Muharraq, Bahreïn

Context: Based on recent evidence, international guidance recommends using Long-Acting Beta-Agonists and Inhaled Corticosteroids (LABA-ICS) therapy for symptomatic mild asthma however this change has not been widely implemented. Prior to initiating a larger trial, the objective of this study was to investigate the superiority of fluticasone-vilanterol in stabilizing mild asthma in adults versus usual care.

Objectives: To investigate the superiority of effectiveness of fluticasone-vilanterol (ICS+LABA) in stabilizing mild-asthma in adults versus usual care.

Methods: We randomly assigned 18 patients with mild asthma in a 1:1 ratio to a treatment (n=10) or usual care (n=8). The treatment group was given daily LABA-ICS treatment while the usual care group continued their treatment (as required short-acting beta agonists (SABA) or SABA and ICS combination and no other asthma medications). Our primary clinical outcome was the asthma control score and the overall quality of life experienced by the patients enrolled in the study under both regimens.

Results: A total of 18 patients were recruited from a primary health care centre and randomized. The mean (SD) age was 40.40 (17.32) years old among the intervention group and 54.88 (17.92) in the control group. Fifty per cent of participants were male in the intervention arm and 75% in the control arm. The baseline mean asthma control score was 2.91 among intervention and 3.26 among control group and the baseline mean quality of life score was 4.56 among the intervention group, and 5.08 among the control group. We found no significant differences at baseline between the intervention and control groups. No serious adverse events or changes in quality of life were reported.

Discussion: Our results are consistent with the START (Beasley et al., 2019), PRACTICAL (Hardy et al., 2019) and SMART trials (Bell & McIvor, 2007) and support the international move to ICS±LABAs for the treatment of mild asthma as a more effective intervention than SABAs alone. Our study encountered challenges in recruitment due to the recent SARS-CoV-2 pandemic.

Conclusion: Although additional data with larger sample size is urgently required, this interim evidence suggests that it is time to shift asthma management away from as needed SABAs for patients with mild asthma.

Melanoma

ID 2121- Knowledge, attitudes and practices regarding solar risk among photo-exposed workers or leisure and sport pratitioners in XXX during the 2023–2024 period

Jessica DUMEZ [(1)] , Tiphaine FARCOT [(2)], Amaury DUJARDIN [(2)], Adrian FIANU [(3)], Catherine MARIMOUTOU [(3)], Antoine BERTOLOTTI [(3)]

(1) Faculté De Santé, Terre-Sainte, La Réunion, Boueni, Mayotte
(2) Faculté De Santé, Terre-Sainte, La Réunion, Terre-Sainte, Réunion
(3) Cic Inserm 1410, Terre-Sainte, Réunion

Context: Sun exposure is a major risk factor for skin cancers and eye diseases. XXX are undergoing extreme levels of ultraviolet radiation.

Objectives: The aim of this study was to describe the knowledge, attitude and practices of outdoor workers or leisure and sport practitioners regarding the risks associated with sun exposure.

Methods: The cross-sectional, descriptive, multicenter study focused on volunteers' workers more than 2 hours per day outdoors or leisure and sports participants practicing more than 4 hours per week. They answered a questionnaire.

Results: A total of 529 workers (W) and 532 leisure and sports participants (SP) were included between 2023 and 2024. Most were men (73.3%), with a mean age of 39 years. The II and III phototype were dominant in XXX and V and VI in XXX. The mean knowledge score was 16.2/20 (± 3.87), with more than half scoring > 15/20 for SP. Concerning W, a difference of knowledge score were observed between XXX and XXX. The mean behavior score was between 9,17/20 +/- 3,83 in XXX and 11.0/20 ± 4.4 in XXX. Half of the respondents reported not using sunscreen. Only trousers exceeded 50% in systematic use for workers on both XXX, and glasses in XXX. The average number of hours spent at work or for leisure in the sun in our study is between 7.0 h +/- 8.3 and 8.26 h +/- 2.59. They reported sunburn affecting more than a third of sports and leisure participants and up to 50% of workers in XXX.

Discussion: The recruitment method without random selection from the general population is the main selection bias. Collecting data via self-administered questionnaires exposes respondents to reporting bias, particularly social desirability bias. The study is based on a large sample size, the knowledge assessment questionnaire had already been used in 4 previous studies proving its reliability and feasibility.

Conclusion: Although overall knowledge levels were good, photoprotection behaviors remained inadequate among sun-exposed workers or leisure and sport pratitioners in XXX. Disparities by education level and occupational sector emphasize the need for strengthened, targeted prevention strategies, engaging general practitioners, occupational health services and sport leagues in promoting effective photoprotection practices.

Corresponding author: Jessica Dumez, jessica.dumez@univ-reunion.fr

ID 1619- Health Literacy and Sun Protection Behaviours in Parents of Young Children: A Primary Care Based Study

Esra KARAPINAR GÖZE [(1)] , Bahar ÜRÜN ÜNAL [(2)]

(1) Primary Health Care Center, İstanbul, Türkiye
(2) Department Of Family Medicine, Selçuk University, Faculty Of Medicine, Konya, Türkiye

Context: According to GLOBOCAN 2022 data, the fifth most common cancer type worldwide is non-melanoma skin cancer, while melanoma ranks 17th. Exposure to the sun during childhood is also a factor that significantly increases the risk of skin cancer in adulthood. Parents' health literacy plays a crucial role in adopting and developing protective health behaviors. In family medicine, assessing this relationship in primary care is essential for strengthening preventive practices and developing effective risk reduction strategies.

Objectives: The objective of this study is to determine the relationship between the health literacy levels of parents with children aged 0-10 years and their sun protection behaviors, and to identify the sociodemographic factors that influence this relationship.

Methods: This quantitative study was designed as a descriptive cross-sectional correlational study. It was approved by the Local Ethics Committee of Selçuk University Faculty of Medicine (Decision No: 2025/531, Date: 09.09.2025). The study population consists of parents with children aged 0–10 years who visited the family medicine outpatient clinic of a university hospital in Konya, Turkey. The sample size was calculated to be at least 139 participants. Data collection tools included a sociodemographic information form prepared by the researcher, a sun protection behavior scale, a Fitzpatrick skin type scale, and a health literacy scale-short form. All data will be evaluated using the SPSS version 21.0.

Results: Data collection phase is currently ongoing. The direction and magnitude of the relationship between health literacy and sun protection behaviours will be analysed. Results will be presented by the time of the conference.

Discussion: Data collection phase is currently ongoing. Discussion will be presented by the time of the conference.

Conclusion: This study is expected to provide important evidence regarding the effect of parents health literacy levels on sun protection behaviors. The results are expected to contribute to the planning of sun protection education in family medicine practices and the development of methods to increase health literacy. At the same time, it will enhance awareness on this issue and increase the attention and sensitivity of primary care physicians in accordance with the first contact principle.

ID 1462- Artificial Intelligence-Assisted Dermoscopy for Melanoma Diagnosis in Primary Care: An Evidence-Based Review

Beatriz SOUSA NOBRE [1] , Margarida PEREIRA [2], Khrystyna FEDAK [3], Gabriela GUIOMAR [2], Dinis BRITO [1]

(1) 7 Fontes Unith Of Health,, Braga, Portugal
(2) Braga Norte Unith Of Health,, Braga, Portugal
(3) Ruaes Unith Of Health,, Braga, Portugal

Context: Dermoscopy is an essential tool for melanoma detection, and recent progress in artificial intelligence has led to the development of automated diagnostic systems that may complement or even substitute traditional evaluations by dermatologists. In Primary Care, Family Physicians are often the first professionals to assess patients with atypical nevi or suspicious skin changes, placing them in a central role for early detection and prevention.

Objectives: To assess the evidence on the use of AI-based dermoscopy for melanoma screening and diagnosis compared with dermatologists.

Methods: Evidence-based databases—PubMed, BMJ Evidence-Based Medicine, Laurier and Omni Library, NICE, and The Cochrane Library—were searched for systematic reviews, meta-analyses, randomized controlled trials, case-control studies, and comparative studies published from 2015 to 2025 in English or Portuguese. The MeSH terms dermoscopy, artificial intelligence, and melanoma were used. Exclusion criteria were duplicate articles, inaccessible full texts, absence of comparison with dermatologists, lack of melanoma assessment, and non-original content such as editorials, letters, or opinion pieces.

Results: Among the 61 records screened, studies consistently reported high concordance rates between AI-assisted dermoscopy and dermatologist diagnoses, with some evidence indicating comparable or even superior sensitivity and specificity. AI tools demonstrated potential to improve diagnostic efficiency and support clinical decision-making, particularly in resource-limited settings. However, variability in algorithms and study designs highlights the need for standardized evaluation frameworks

Discussion: Most studies report high concordance rates between AI-assisted tools and dermatologist diagnoses, with some algorithms demonstrating comparable or superior sensitivity and specificity. These findings suggest that AI may enhance early

melanoma detection and support Family Physicians in managing skin lesions at the point of care. Nonetheless, limitations persist, including heterogeneity in algorithm performance, differences in study designs, and concerns regarding external validity. Further research is required to clarify reliability across diverse populations and clinical settings.

Conclusion: AI-based dermoscopy shows high accuracy for melanoma detection, offering Family Physicians improved diagnostic capabilities, greater accessibility, and potential cost savings by reducing unnecessary referrals and optimizing resource use in primary care.

Corresponding author: Beatriz Sousa Nobre, beatriz.nobre@ulsb.min-saude.pt

ID 684- Dermoscopy Accuracy in Family Medicine: Comparison With Dermatology and Histopathology

Nataša NASKOVSKA ILIEVSKA

None, Maribor, Slovénie

Context: Accurate diagnosis of skin lesions is vital for effective patient management. Integrating clinical evaluation, dermoscopy, and histopathology improves diagnostic precision. This study evaluates the concordance between these modalities in a cohort presenting multiple concurrent skin lesions at 84 patients during 2 year period.

Methods: From September 2023 to August 2025, 84 patients underwent dermoscopic evaluation. Lesions were assessed under polarized and non-polarized light using pattern analysis and the 7-point checklist. Excision was performed for lesions with malignant dermoscopic criteria. Clinical and\or dermoscopic uncertain diagnoses were confirmed by histopathological examination, the gold standard. Data cleaning standardized terminology, and lesion combinations per patient were assessed.

Originality: This study underscores the real-world complexity of multiple lesion coexistence and validates the necessity of histology to confirm unsure clinical and dermoscopic assessments. Studies consistently show high concordance rates of 70–90% between clinical di

Lessons learned and future implication: Histological confirmation remains essential, especially in ambiguous or coexisting lesions, ensuring accurate malignancy detection and appropriate management. Combined dermoscopic and histological approaches reduce diagnostic errors.

Discussion: The findings support existing literature reporting strong diagnostic concordance, emphasizing histopathology's pivotal role (Ziajka et al., 2018; Lee et al., 2022). The study also highlights the prevalence of multiple lesion types per patient, necessitating comprehensive diagnostic evaluation for high clinical trustworthiness.

Conclusion: Confirming dermatological diagnoses through histopathology alongside dermoscopy enhances diagnostic confidence and patient outcomes. This integrative approach should be standard in dermatology practice and research to ensure precise disease classification and guide treatment effectively. Dermoscopy achieved high diagnostic concordance with histopathology and effectively guided lesion management. Integration of dermoscopy with selective excision and follow-up enhances diagnostic accuracy and patient safety in routine family medicine practice.

ID 486- A 4-point checklist for skin cancer screening: the new, changing, different, sore (NCDS) tool

Mohamad ALMOBAIED, David BUCKLEY, Tadhg O'SHEA

Irish College Of General Practitioners, Killarney, Irlande

Context: Non-Melanoma Skin Cancers (NMSCs) and amelanotic melanomas contribute substantially to morbidity and mortality. However, existing screening methods, ABCDE and the Mackie 7-point check list, over-emphasise pigmented lesions and are often complex, making them unsuitable for the general public and potentially missing most NMSCs

and amelanotic melanomas. General Practitioners (GPs) face high diagnostic uncertainty, leading to excessive referrals. We propose and validate the simplified Buckley 4-point NCDS checklist—New, Changing, Different, Sore (a simple mnemonic is "New Cancers Do Show") designed to help detect all skin cancers and precancers.

Objectives: The primary objective of this study was to prospectively validate the NCDS checklist for its diagnostic accuracy (sensitivity and specificity) and utility in (positive and negative predictive value). detecting malignant invasive, suspicious, and premalignant skin lesions in a primary care setting.

Methods: This prospective diagnostic validation pilot study took place in a specialist-led primary care dermatology clinic in Ireland. We assessed 190 lesions against NCDS criteria, followed by clinical assessment, dermoscopy, and histopathology. Performance was evaluated using standard diagnostic metrics, with inverse probability weighting correcting for selection bias..

Results: The Area Under the ROC Curve (AUC) for the NCDS score was 0.729 (95% CI 0.657–0.801) after adjustment for verification bias, indicating acceptable discrimination. Using a cut-point of Score ≥1 yielded a high Negative Predictive Value (NPV) of 87.5%. Conversely, a cut-point of Score ≥3 provided a high Positive Predictive Value (PPV) of 72.5% and high specificity (93.8%)

Discussion: The NCDS tool's utility varies by cut-point. A score of ≥1 is ideal for public self-screening, acting as a rule-out strategy due to its high NPV. This offers high assurance to negative respondents. A score of ≥3 prioritizes high-risk lesions for professional evaluation (high PPV), streamlining referrals. This dual approach maintains high sensitivity (minimizing missed cancers) while ensuring adequate specificity (minimizing unnecessary biopsies

Conclusion: The NCDS checklist is a simple, easy-to-remember educational tool that comprehensively screens for all skin cancers and precancers. By differentiating between low-risk (Score 0) and high-risk (Score≥3) lesions, the NCDS tool has the potential to aid early diagnosis, optimise specialist resource use, and streamline referral pathways in the primary care setting.

ID 393- Cutaneous Melanoma Trends 2020–2025: Global Evidence and Mediterranean Challenges

Montserrat ANDREU MIRALLES, Rosa RIPOLLES VICENTE, Daniela LLEIXA LLEIXA, Dayana MODESTO COMPANIONI

Generaltitat Catalunya, Tortosa, Espagne

Context: Background: Cutaneous melanoma continues to show a rising global incidence, particularly in fair-skinned populations and Southern European countries. Recent epidemiological reports highlight increasing trends in XXX and France, with shifts toward older age groups and greater diagnostic variability between rural and urban settings. Understanding regional patterns is essential for developing targeted prevention and early-detection strategies.

Objectives: To review recent evidence (2020–2025) on global and Southern European melanoma incidence, mortality, and stage at diagnosis, and to identify knowledge gaps relevant to rural Mediterranean regions such as the XXXXXX

Methods: A narrative literature review was conducted using PubMed, Scopus and Web of Science (January 2020–May 2025). Search terms included "cutaneous melanoma", "incidence", "mortality" Eligible studies included epidemiological analyses, registry-based studies, and major reviews published in English, Spanish or French. Data were synthesised qualitatively.

Results: Global melanoma incidence continues to rise, while mortality stabilises or declines in many high-income countries. Southern Europe shows a persistent upward trend, with higher incidence in coastal and highly sun-exposed populations. Several studies report delayed diagnosis and thicker tumours in rural settings, partly related to reduced access to dermatology and variable use of dermatoscopy in primary care. Evidence linking photoprotection habits, occupational sun exposure and melanoma risk in Mediterranean rural regions remains limited.

Discussion: The findings of this review confirm that cutaneous melanoma remains a growing public health challenge, particularly in Southern European regions with intense UV exposure and ageing populations. Although global mortality has stabilised due to earlier detection and improved therapies, the persistent rise in incidence highlights gaps in both primary prevention and diagnostic pathways. . Furthermore, few studies integrate behavioural and environmental determinants such as occupational sun exposure, photoprotection habits, or cultural attitudes toward tanning, despite their clear relevance in Mediterranean settings. These gaps justify the need for analytical research

Conclusion: Recent literature underscores the growing melanoma burden in Spain and France and highlights persistent inequalities in early detection. Further region-specific research is needed to clarify how sun-exposure patterns, photoprotection behaviours and healthcare accessibility influence melanoma risk in rural Mediterranean populations. Keywords: melanoma, incidence, epidemiology

Corresponding author: Montserrat Andreu Miralles, mandreu18@gmail.com

ID 390- Analysis of risk factors associated with the diagnosis of cutaneous melanoma between 2010 and 2020 in our territory: retrospective observational study of a 1:2 matched case-control type.

Montserrat ANDREU MIRALLES, Rosa RIPOLLES VICENTE, Daniela LLEIXA LLEIXA, Dayana MODESTO COMPANIONI

Generaltitat Catalunya, Tortosa, Espagne

Context: Introduction: Skin melanoma is a cutaneous neoplasm with significant impact due to its high metastatic potential. In our Autonomous Community, its incidence has increased by 3.5% annually since 2008, particularly among individuals over 60 years old. Our region experiences high sun exposure, an agricultural economy, and low population density, factors that may affect access to early diagnosis.

Objectives: population density, factors that may affect access to early diagnosis. Objectives: Hypothesis: The combination of high sun exposure, outdoor occupations, and poor prevention leads to the diagnosis of melanoma at more advanced stages compared to the rest of the Autonomous Community. General Objective: To characterize the incidence, clinical features, and factors associated with skin melanoma. Specific Objectives: Quantify the annual incidence (2010-2020) per 100,000 inhabitants. Describe subtype, location, Breslow index, and TNM stage. Analyze the association between sociodemographic characteristics and advanced melanoma. Estimate the impact of recreational and occupational sun exposure. Compare the diagnostic stage with data from our Autonomous Community.

Methods: Retrospective analysis of melanoma incidence and characteristics (2010-2020) and a 1:2 matched case-control study. T Variables include: age, sex, municipality, profession, melanoma types, Breslow index, ulceration, TNM stage, family history, photoprotection habits, occupational sun exposure (>20 hours/week), sunburns before age 20, diagnostic time, and access to primary care. include descriptive statistics, chi-squared tests, t-tests or Mann-Whitney tests, multivariate logistic regression, and conditional logistic regression by pair. Temporal trends will be analyzed using Poisson regression. Software: R 4.3.2 or STATA.

Results: Now we are working with de results

Discussion: Prevention and Public Health Promotion: Identifying risk behaviors to improve community awareness strategies. Development of Photoprotection Campaigns: For school programs, workshops for the general population, and training for local healthcare professionals. Contribution to Epidemiological Research in Rural Areas: Providing new data on a population that has been under-studied, supporting future regional or multicenter research.

Conclusion: The conclusion of this study is that, based on the results obtained, we expect to identify the specific risk factors present in our region and to implement preventive and educational interventions for the population, as well as to better prepare our healthcare professionals. Melanoma, Risk Factors, Primary Care

ID 2172- Psychosocial Skills and Patients with Suicide Attempts or Suicidal Risk : Assessment and Comparison with no risk Patients

Catherine LAPORTE [(1)] , Elise AURIAT [(1)], Lise BOUSCARY [(1)], Emilien LAFARGE [(1)], Bruno PEREIRA [(2)], Massimilliano ORRI [(3)], Carine SIMAR [(4)]

(1) Département De Médecine Générale, Faculté De Médecine, Clermont-Ferrand, France
(2) Drci-Chu Clermont-Ferrand, Clermont-Ferrand, France
(3) Mc Gill, Montréal, Canada
(4) Inspé, Clermont-Ferrand, France

Context: Suicide is a major cause of death worldwide. Psychosocial skills (PSS) are defined along three axes: emotional (self-esteem, coping), cognitive (impulsivity, critical thinking, and constructive decision-making), and social (empathy, communication). Studies have already shown that poor adaptation and low self-esteem are linked to an increased risk of suicidal events in young people. The assessment of PSS in the adult population is understudied.

Objectives: To evaluate and compare PSS between three groups: patients with history of suicide attempt (SA), with suicidal risk (SR), and no risk of suicide (NR).

Methods: Multicenter cross-sectional comparative study. We used a validated score that explored four dimensions: emotional, cognitive, social, and assertiveness. To achieve sufficient statistical power, 150 interviews (50 per group) were required. All results were derived from univariate, multivariate, and factorial analyses, using Stata® software (version 15, StataCorp, College Station, USA).

Results: Patients of SA and SR groups had lower emotional skills score than patients without sucidal risk suicide (respectively 3.9 ± 1.2, et 3.6 ± 1.5 vs 5.3 ± 0.9), ($p<0.01$). We compared skills by gender men had better emotional skills (4.7±1.2 vs 4±1,4, p= 0.008) and women better social skills (6±0.9 vs 5,6±1, p= 0.001), with no difference in cognitive skills or assertiveness. More precarious living conditions, depression, anxiety, and low self-esteem were observed in the SA and SR groups than in patients with no risk. Through the various analyses, we therefore highlighted that the profiles of suicidal and suicidal patients were quite comparable and distinct from the profile of patients without a history of suicidality.

Discussion: The study's strengths lie in the absence of missing data, as each included patient completed the entire questionnaire, and in the method of assessing cognitive behavioral skills (CPS) using a standardized and validated questionnaire. The study's weaknesses may include reporting bias, recall bias, and self-assessment bias.

Conclusion: The prospects for this study are to promote the screening of dysfunctions in PSS among at-risk patients: the most vulnerable among the vulnerable. Causality will need to be studied, but programs to strengthen emotional skills could mitigate the risk of suicide.

ID 1820- Personal and family factors associated with depressive symptoms among the XXX elderly in the community after the COVID-19 pandemic

Michael Angelo CELESTE, Jessica Mae CRUZ, Mel Anthony ACUAVERA

The Medical City Ortigas, Pasig City, Philippines

Context: Globally and locally in the XXXXX, there is a growing geriatric population with numerous health problems. Depressive symptoms are common health issues among older adults, but are often underdiagnosed and undertreated. Suicidality is tied to depressive symptoms and its factors overlapping with one another. Past pandemics have demonstrated negative effects on mental health, with the COVID-19 pandemic severely affecting the elderly who are most vulnerable and may persist after the pandemic.

Objectives: This study aims to determine the personal and family characteristics that contribute to the development of depressive symptoms and suicidality among the XXXXX geriatric population in the community setting after the COVID-19 pandemic.

Methods: A cross-sectional study was done, where 160 participants were interviewed and screened for depressive symptoms and suicidality using the Patient Health Questionnaire-9 (PHQ-9) and Colombia-Suicide Severity Rating Scale (CSSR-S), while factors for these were analyzed through simple and multiple logistic regression analysis.

Results: Results showed nearly half of participants had depressive symptoms (45.63%), which were frequently documented as minimal (38.13%) and mild (6.25%). Only 3.75% were found to have some risk for suicidality. Higher educational attainment [OR 0.54, CI 0.34-0.88, p-value 0.013] and higher Family APGAR scores [OR 0.60, CI 0.46-0.79, p-value 0.0] were found to decrease the likelihood of depressive symptoms, while certain comorbid illnesses [OR 3.48, CI 1.57-7.75, p-value 0.002] increased it. Higher Family APGAR Scores [OR 0.66, CI 0.52-0.83, p-value 0.0] and higher functionality in ADLs [OR 0.07, CI 0.006-0.81, p-value 0.033] decreased likelihood for suicidality.

Discussion: This study showed that minimal and depressive symptoms are commonly encountered, but studies showed that subsyndromal depression can have negative implications to health in older adults. Suicidality, despite only a small number identified, is important to be assessed alongside depressive symptoms. Several factors can contribute to the likelihood of developing depressive symptoms and suicidality, with higher family functionality emphasized as a consistent factor that reduces these.

Conclusion: Depressive symptoms and suicidality are health problems that are essential to examine by clinicians in older adults, where primary care is best positioned to detect and intervene these early, as well as the personal and family factors that can influence them.

ID 1537- How can primary care professionals talk about addiction? A Top 3 questions selected by patients

Maxime PAUTRAT

Faculté Médecine, Tours, France

Context: Despite recommendations encouraging SBIRT (Screening, Brief Intervention, and Referral to Treatment) in primary care, initiating a discussion about addictive disorders remains challenging. Current guidelines do not specify how to deal with addictive disorders, even though patients expect them to do so

Objectives: The aim of this study is to explore the acceptability to patients of fifteen questions asked by their primary care professionals to address addictive disorders.

Methods: Cross-sectional quantitative study conducted among patients addicted or not, from waiting rooms at GPs' offices or peer support group meetings as Alcoholics Anonymous, between January and May 2025. Fifteen questions selected from validated tests, translated and reformulated according to health literacy principles, were distributed via an online questionnaire (EVALandGo®). Each participant rated the level of acceptability in receiving them on a Likert scale (1 to 4). Participants were invited to choose their preferred question. A bonified means, incorporating the frequency of preferences, was used to establish the final ranking.

Results: A total of 131 patients responded and identified the following as the most appropriate questions: “Have you ever tried unsuccessfully to reduce or stop a consumption or a behavior? “ (bonified mean = 4,73), “Have you ever had an irresistible craving to consume or do something?” (4,43) and “Do you need a substance or behavior to relax, feel better, or cope?" (4,40). The less popular question was "Do your relatives have a problem with your relationships?" (2,91).

Discussion: Knowing the formulations that are acceptable to patients could empower caregivers to initiate discussions. But the test-retest reliability and the impact on the frequency of start talking about addiction in consultation by primary care professionnals helped by these questions have to be evaluate.

Conclusion: By comparing the results of the same study conducted among primary care professionals,

the top-2 best questions identified as most suitable to help primary care professionals address addictive disorders are: “Have you ever tried unsuccessfully to reduce or stop a consumption or a behavior? “and “Do you need a substance or behavior to relax, feel better, or cope?”

Corresponding author: Maxime Pautrat, maxime.pautrat@univ-tours.fr

ID 1270- Associations of practice- and patient-characteristics in patients with depression in primary care: Cross-sectional analysis from the practice-based research-network FoPraNet-BW

Claudia SALM [(1)] , Karin SCHEESER [(1)], Haumann HANNAH [(2)], Barzel ANNE [(3)], Schmutz PATRICK [(4)], Schönhagen ANNA [(5)], Maun ANDY [(1)]

(1) Institute Of General Practice/family Medicine, Medical Center – University Of Freiburg, Faculty Of Medicine, Germany, Freiburg, Allemagne
(2) Institute For General Practice And Interprofessional Care, University Hospital Tübingen, Tübingen, Germany, Tübingen, Allemagne
(3) Department Of General Practice And Primary Care, Ulm University Hospital, Ulm, Germany, Ulm, Allemagne
(4) reutlingen Research Institute, Reutlingen University, Reutlingen, Germany., Reutlingen, Allemagne
(5) Universitätsklinikum Heidelberg, Abteilung Allgemeinmedizin Und Versorgungsforschung, Medizinische Fakultät Der Ruprecht-Karls Universität Heidelberg, Deutschland, Heidelberg, Allemagne

Context: Patients with depressive symptoms consult the general practitioner’s (GP) office often primarily. we performed an observational study on diagnosis and treatment of depression in primary care (BEBOP Depression) as one of four use-cases testing the new infrastructure of the German general practice–based research network Forschungspraxennetz Baden-Württemberg (FoPraNet-BW).

Objectives: To describe diagnostic and treatment patterns for patients with depression in primary care using the quality indicators (DMP-QI) of the upcoming national disease-management-program for depression and to examine associations between practice- and patient-characteristics and three indicator areas.

Methods: This exploratory cross-sectional-analysis used data from patients in participating GP-practices. Eligible patients had depression (ICD-10 F32, F33) and at least four GP-consultations for depression within the previous two years. Patients who declined research-data-processing were excluded. Potential participants were contacted by trained GP-practice-staff (research team) according to a randomized presentation sequence. After informed consent, the research team entered the data into the electronic case-report-form. Practice characteristics stemmed from basic questionnaires answered by all FoPraNet-BW-practices. Statistical analyses covered binary logistic regressions to examine the associations between the outcomes therapy according to severity, improvement of symptoms and documentation of suicidality with practice- and patient-characteristics. Missing data were addressed using multiple imputation in R Version 4.4.2.

Results: 420 datasets out of 55 practices were included. 30 (54.5%) solo and 25 (46.4%) group practices from urban and rural sites participated. Patients’ mean age was 54.3 (SD 16.19) years, 285 (67.9%) patients were female, and 194 (46.2%) patients did not consult a psychiatrist. Significant associations were found between therapy according to severity and psychiatric co-care (odds ratio (OR) 5.37,95%-CI1.97-14.67,p-value0.001) and a practice’s patient volume of 1,500-2,500 compared to 500-1,000 patients per practice (OR 0.28,95%-CI0.09-0.92,p-value0.035). Improvement of symptoms was associated with the number of antidepressants (OR 0.76,95%-CI 0.59-0.97,p-value0.028) and waiting time for further therapy (OR 0.38,95%-CI0.21-0.67,p-value < 0.001). Documentation of suicidality was associated with being widowed (OR 2.74,95%-CI1.23-6.08,p-value0.014), the number of antidepressants (OR 1.27,95%-CI1.02-1.58,p-value0.036) and psychotherapeutic co-treatment (OR2.13,95%-CI1.35-3.35,p-value 0.001).

Discussion: Results highlight everyday-care. DMP-QI can only partly be fulfilled and are associated with practice- and patient-characteristics.

Conclusion: Further research into relevant and feasible quality improvements in depression care is required.

ID 775- Social Anxiety Disorder Associated with Substance Use Disorder : Characteristics from a Literature Review to Optimize Screening in General Practice.

Vincent RIFFAULT, Mathilde COURRÈGE

Department Of General Practice, Faculty Of Medecine, University Of Tours, Tours, France

Context: Social Anxiety Disorder (SAD) and Substance Use Disorder (SUD) frequently coincide, tend to reinforce each other, and their co-occurrence therefore requires a specific management approach. Indeed, a treatment that addresses one disorder without taking the other into account can lead to treatment failures and complicates the patient's care pathway. It therefore appears important to identify early and within the scope of what primary care can realistically provide, the co-occurence of a SAD and a SUD.

Objectives: This literature review aims to identify the characteristics of the presence of SAD, associated with SUD, to improve detection in primary care.

Methods: A systematic literature review was conducted using PubMed, PsycINFO, Science Direct, and Google Scholar databases, leading to the selection of 26 articles. This study follows the recommendations of the PRISMA guidelines.

Results: SAD precedes SUD in most cases, with a peak onset during adolescence. In adulthood however, SUD takes precedence. Two subtypes of SAD are distinguished : the avoidant or generalized subtype, predominantly female, is associated with substance use to reduce negative emotions (coping). The performance-only or "motivated approach" subtype, more common in men, uses substances for social conformity reasons and increase positive affect. Anticipatory anxiety, the use of "false safety behaviors" and the context of consumption appears as important indicators to detect as well as the failure of a treatment targeting only one of the disorders.

Discussion: The characteristics identified are heterogeneous in nature. To make them usable for detection in primary-care medicine, we propose two optimized algorithms allowing a faster first-line screening. Although the predictive values of the highlighted characteristics are unknown and the studies do not cover all the types of populations, this work is the first to synthesize screening elements for SAD co-occurring with a SUD for use in primary care practice.

Conclusion: These findings suggest the possibility of targeted detection in primary care according to age, based on the context of consumption, specific motivations, and behaviors. Integrating a sequence of simple questions during clinical interviews could enable more efficient detection, thus adapting primary care to facilitate referral to integrated treatment (SAD and SUD), offering a better functional and somatic prognosis.

ID 690- Exploring the determinants of Non-Suicidal Self-Injury among university students in Jordan: A cross-sectional study

Hana TAHA

Department Of Family And Community Medicine, School Of Medicine, The University Of Jordan, Amman, Jordanie

Context: Based on litereture, social anxiety is the most significant predictor of deliberate self-harm, with depression and general anxiety having lower associations.

Objectives: Deliberate bodily harm without suicidal intent, has become a growing concern among young adults and adolescents. This study aims to explore the determinants of non-suicidal self-injury ((NSSI) and its correlation with psychological distress and mobile phone addiction (MPA) among university students in Jordan.

Methods: A quantitative cross-sectional study targeting university students in Jordan. The data was collected using a semi-structured online questionnaire that assessed sociodemographic characteristics, mobile phone addiction, depression, anxiety, suicidal thoughts and NSSI. SPSS 30 was used for descriptive and multivariate analysis. Spearman's correlation, Chi-square, Kruskal- Wallis and Man-Whitney U were applied. Binary logistic regression was conducted to identify the predictors of significant NSSI.

Results: Out of 394 students, 63.2% reported at least one self-harm behavior, while the remaining students scored zero on the Self Harm Inventory (SHI). Significant self-harm, defined as SHI > 5, was reported by 20.56% of participants. Higher levels of anxiety and depression were strongly associated with increased NSSI severity ($p < .001$). Depression was a strong predictor of significant self-harm ($p < .001$, OR = 1.209). Participants who reported experiencing negative or traumatic events during childhood, or having a family member with a psychological disorder, were significantly more likely to fall into the higher-risk NSSI category ($p < .001$).

Discussion: Self-injury serves as an emotion-regulation strategy that temporarily alleviates negative affect in students with high internal distress. Our results aligns with prior evidence that individuals with depressive symptoms often use self-injury to relieve psychological pain.

Conclusion: This study demonstrated a high prevalence of NSSI among the study participants that was strongly associated with psychological distress and dysfunctional family environment, which may provide insight into its etiology and has implications for early identification and intervention.

ID 585- It's Just Stress or Is It? Rethinking Diagnostic Bias in young adults

Yoni LEICHT

Clalit Hmo, Ramat Gan, Israël

Context: Family physicians frequently encounter transient symptoms embedded in psychosocial stressors, making early diagnostic decisions particularly challenging. A 31-year-old man presented with brief neurological complaints during a period of major life changes (fatherhood), illustrating the tension between person-centred interpretation and vigilance for organic disease in young adults.

Methods: the patient with no vascular risk factors presented to his family physician in a community clinic after experiencing brief neurological symptoms earlier that morning. The symptoms had largely resolved by time of assessment and the initial working hypothesis was stress-related. a focused neurological examination revealed mild cranial-nerve asymmetry. This unexpected finding prompted immediate referral to the emergency department. In the ED, initial workup and evaluation were inconclusive. Brain MRI later demonstrated a subacute infarction in the left middle cerebral artery territory. Major etiologies were excluded, and extended testing is ongoing. The patient was started on a secondary prevention regimen and returned to primary care for ongoing management which includes coordination of investigations, lifestyle counseling, and psychosocial support as the patient processes the diagnosis.

Originality: This case illustrates how cognitive and contextual biases particularly anchoring and premature closure may obscure serious diagnosis in primary care. Stroke in young adults is uncommon and can easily overlooked. This case highlights the risk of anchoring

Lessons learned and future implication: Maintaining an open diagnostic mindset and revisiting assumptions are essential in ambiguous presentations. Family physicians are uniquely positioned to identify subtle warning signs and communicate diagnostic uncertainty. Reflection on cognitive bias and

Discussion: The case illustrates a common cognitive trap in family medicine: bias influenced by psychosocial context. Recognizing and naming these biases can improve diagnostic accuracy and patient safety. Integrating cognitive-bias reflection into medical education may strengthen diagnostic reasoning skills across primary care.

Conclusion: Even in young, healthy patients with plausible psychosocial explanations, vigilance for neurological red flags remains essential. Reflective practice around diagnostic reasoning can transform such cases into powerful learning experiences for clinicians.

ID 1758- Randomised controlled trial evidence on medicinal cannabis for mental health conditions: implications for real-world evidence generation

Christine HALLINAN [1] , Sophie COOLING [1], David CASTLE [2], Yvonne BONOMO [1]

(1) The University Of Melbourne, Melbourne, Australie
(2) University Of Tasmania, Hobart, Australie

Context: Prescribing of medicinal cannabis (MC) for mental health conditions has expanded rapidly in primary care, often in the absence of regulatory approval or established clinical guidance. Although randomised controlled trials (RCTs) remain the cornerstone of therapeutic evaluation, their feasibility and applicability in this context are constrained by ethical, regulatory, and methodological factors. Clarifying the strengths and limitations of existing RCT evidence is therefore essential to informing complementary real-world evidence approaches relevant to primary care.

Objectives: To synthesise and characterise RCT evidence on medicinal cannabis for mental health and substance use disorders, and to examine its implications for generating real-world evidence to support primary care practice.

Methods: A scoping review using a systematic approach was conducted. PubMed, Web of Science, and PsycINFO were searched for RCTs published between 1980 and 2024 investigating MC-based products for DSM-5 mental health or substance use disorders. Data were extracted on study design, populations, interventions, outcomes, and adverse events. Findings were synthesised descriptively due to substantial clinical and methodological heterogeneity.

Results: Twenty-eight RCTs were identified across 12 DSM-5 conditions. Trials were predominantly small (median sample size 42), short in duration (median follow-up six weeks), and highly heterogeneous in cannabinoid composition, dosing, and outcomes. Evidence of benefit was inconsistent and largely limited to short-term symptom outcomes in selected conditions, including cannabis use disorder, autism spectrum disorder, and schizophrenia. No trial demonstrated sustained long-term effectiveness, and reporting of adverse events and treatment discontinuation was variable. Overall, the RCT evidence was insufficient to inform real-world prescribing decisions regarding long-term safety, dose optimisation, or interactions with commonly prescribed psychotropic medicines.

Discussion: The RCT evidence base highlights a structural mismatch between trial methodologies and contemporary prescribing of MC. Trials were conducted under highly controlled conditions with narrow eligibility criteria and short follow-up, whereas real-world prescribing commonly involves long-term use, multimorbidity, polypharmacy, and heterogeneous patient populations.

Conclusion: While RCTs provide important foundational evidence, they are insufficient to address many clinically relevant questions related to MC use in mental health. High-quality real-world evidence, using longitudinal electronic medical record data, is urgently needed to monitor outcomes, detect harms, and inform safe, evidence-based policy and practice in primary care.

ID 1789- Identifying suicide risk in bipolar patients: key warning signs for family physicians

Emna HAJJI [1] , Imen BETBOUT [1], Walid BOUALI [2], Marwa BEN MBAREK [1], Nour FAOUEL [1], Ahmed MHALLA [1]

(1) Department Of Psychiatry, University Hospital Of Monastir, Monastir, Tunisia, Monastir, Tunisie
(2) Department Of Psychiatry, University Hospital Of Mahdia, Mahdia, Tunisia, Mahdia, Tunisie

Context: Suicide is a significant cause of premature death in patients with bipolar disorder. Family physicians are usually the first to see these patients, and it is critical for them to identify patients at risk of suicide.

Objectives: This study aimed to estimate the prevalence of suicide attempts among patients with bipolar disorder and to identify associated risk factors relevant to primary care practice.

Methods: We performed a cross-sectional analytic study of 281 patients with bipolar disorder (types I and II) treated for four years in a psychiatric hospital. Sociodemographic, clinical, psychosocial and treatment information were also obtained. Patients were divided into two groups according to the presence or absence of a history of suicide attempts. Univariate and multivariate logistic regression analyses were performed to identify factors associated with suicide attempts.

Results: The prevalence of suicide attempts was 22.8%. Among patients with a previous attempt, 71.4% had experienced recurrence. Multivariate analysis identified depressive polarity of bipolar disorder (OR = 19.23), family history of suicide attempts (OR = 6.00), and poor insight (OR = 7.01) as independent risk factors. Older age at disease onset and treatment with atypical antipsychotics were found to be protective factors. Sociodemographic characteristics showed weak or no significant association with suicide attempts.

Discussion: Several determinants of suicide risk identified in this study are accessible to family physicians during routine consultations, including family history, illness trajectory, and current mood polarity. The high recurrence rate highlights the importance of systematic risk assessment even outside psychiatric settings.

Conclusion: Family physicians play a role in early detection of suicide risk among bipolar patients. Integrating structured screening of psychiatric history into primary care may improve prevention and timely referral.

ID 1777- Understanding Youth Mental Health: A Multi-Country Qualitative Study (The EARLY Study)

Limor ADLER [1] , Behr KIM-JULIAN [2], Vinker SHLOMO [1], Marchini SIMONE [3], Ben-Shaool ELLA [4], Wojtecka AGNIESZKA [5], Konieczna AGATA [5], Jevtic MARIJA [6], Brkić-Jovanović NINA [6], Lindert JUTTA [2]

(1) Department Of Family Medicine, Gray Faculty Of Medical & Health Sciences, Tel Aviv University, Tel Aviv, Israël
(2) Department Of Social Work And Health, University Of Applied Sciences Emden/leer, Emden, Allemagne
(3) Faculty Of Medicine, Université Libre De Bruxelles, Brussles, Belgique
(4) Department Of Psychiatry For Infant, Child, Adolescent And Youth, University Hospital Brussels, Brussles, Belgique
(5) Division Of Public Health & Social Medicine, Medical University Of Gdańsk, Gdansk, Pologne
(6) Faculty Of Medicine, University Of Novi Sad, Novi Sad, Serbie

Context: Recent estimates suggest that 10–20% of adolescents globally experience mental health conditions (MHCs), with many cases going undiagnosed and untreated. Youth MHCs are associated with long-term personal and financial challenges, not only for the young person, but also for their family and friends. Youth mental health is influenced by complex and interconnected factors at multiple levels, yet few studies have explored these influences systematically across contexts.

Objectives: This qualitative study aimed to identify perceived risk and protective factors for youth mental health from the perspectives of youth, parents, and stakeholders in five European countries, using the Social Ecological Model as an analytical framework.

Methods: Focus group discussions were conducted with youth (ages 15–24), parents, and stakeholders working with youth in Belgium, Germany, Israel, Poland, and Serbia. A grounded theory approach was used to analyze the data, and findings were categorized across five levels: individual, interpersonal, organizational, community, and societal.

Results: Participants described a range of factors affecting youth mental health. At the individual level, identity development, emotional regulation, and coping behaviors were central. The interpersonal level highlighted the importance of family dynamics, generational gaps, peer support, and school-based relationships. Organizational contexts such as schools, workplace, youth movements and informal education were seen as both stressors and sources of support. Community-

level influences included social norms, and exposure to community-stressors. Societal-level concerns included the influence of social media and geopolitical instabilities.

Discussion: The study highlights that youth perceive peer relationships and social media as the most influential factors on their mental health, while parents and stakeholders place greater emphasis on family influence. It reveals that youth across countries are deeply affected by geopolitical concerns—such as war, political instability, and climate change—which are often underrecognized by adults.

Conclusion: This study highlights the importance of multi-level, context-sensitive approaches to youth mental health promotion. Findings can inform the development of interventions that strengthen protective factors and address structural challenges in diverse settings.

ID 1698- Primary healthcare doctors' views on optimal consultation length for patients with mental health issues

Oksana PETRYNYCH

National University Of Kyiv-Mohyla Academy, Kyiv, Ukraine

Context: Mental health services have been integrated into primary health care (PHC) in Ukraine since 2022. However, despite the specific communication needs of patients with mental disorders, the standard allocated consultation time in many facilities remains unchanged, potentially compromising care quality.

Objectives: To determine PHC doctors' opinions regarding the optimal consultation duration for patients with mental health issues.

Methods: A cross-sectional study using a mixed-methods approach was conducted from March to April 2025 at City Polyclinic No. 1 in Chernivtsi, Ukraine. The quantitative component involved an anonymous online survey of 41 doctors (representing 82% of the PHC doctors). The qualitative component included semi-structured interviews with 5 doctors. Quantitative data were analyzed using IBM SPSS Statistics.

Results: Currently, the maximum allocated time for a consultation is 20 minutes. Only 9.8% of respondents consider this sufficient for mental health cases. Meanwhile, 36.6% deemed it insufficient, and 53.7% stated sufficiency depends on the clinical case. Regarding optimal duration: 46.3% of doctors suggested 30 minutes, while 29.3% and 17.1% advocated for 40 minutes and 50-60 minutes, respectively. Qualitative data reinforced these findings, with respondents emphasizing that empathy, psychoeducation, and active listening require time beyond the standard slot: "Patients require detailed explanations, empathy, and reassurance to ensure treatment adherence; this process is inherently time-consuming" (Respondent 1). "Patients need to be heard. When the next patient is knocking, it is ethically difficult to interrupt a distressing consultation and ask them to return later" (Respondent 3).

Discussion: The majority of respondents (46.3%) identified 30 minutes as the optimal balance for gathering information, to provide psychoeducation, and to support the patient. This suggests a need for flexible scheduling mechanisms.

Conclusion: The findings highlight a conflict between the administrative standardization of consultation slots and the clinical reality of mental health care. The discrepancy between allocated and necessary time requires management interventions, such as introducing double booking slots for primary mental health consultations to ensure quality of care.

ID 985- Prescription of anxiolytics, hypnotics and antidepressants by general practitioners: a regional study of reimbursement data from 2016 to 2023.

Benjamin BASTIAN, Eric MENER, Sarah-Lou MAMOUNE

Department Of General Practice, University Of Rennes, Rennes, France

Context: Anxiolytics, hypnotics, and antidepressants are overused drugs in some European countries. They cause numerous adverse effects and are often used in ways that do not comply with their marketing authorization. Various measures have been implemented by XXXX health authorities to regulate their use, but little data has been published recently to assess their impact. The specifics of their prescription by general practitioners (GP) are also poorly documented, as is the existence of possible regional disparities in their consumption.

Objectives: To quantify the annual deliveries of anxiolytics, hypnotics and antidepressants prescribed by GPs in the XXXX region for patients who consulted them at least once during the year between 2016 and 2023, and characterise these prescriptions.

Methods: Cross-sectional study of reimbursement data from XXXX health database, analysed sequentially by year and by GPs practising in outpatient settings in XXXX between 2016 and 2023. All XXXX GPs with a predefined minimum activity during the period were included. The data analysis was purely descriptive.

Results: Prescriptions issued by 2,779 GPs were analysed for 3,601,397 different patients seen (year 2023). On average, hypnotic deliveries decreased from 22 +/- 16 to 12 +/- 10 dispenses per 100 patients seen per GP per year between 2016 and 2023. More antidepressants were introduced during the period (2.05% +/- 1.22% of patients in 2023 vs. 1.67% +/- 1.24% in 2016). Anxiolytic prescriptions remained stable. Benzodiazepines were prescribed for a duration in line with guidelines for 77.5% +/- 17.9% of hypnotics and 90.2% +/- 7.8% of anxiolytics in 2023.

Discussion: Compared to recent national data on mental health, the increase in antidepressant prescriptions seems consistent, while the stability of anxiolytic consumption in XXXX is a new finding, suggesting regional specificities. The reduction in hypnotic prescriptions suggests that health authorities' efforts in this area have been effective. This study is based on a large volume of objective data but is limited by the approximations required to convert reimbursements into prescription data.

Conclusion: This study has provided a better understanding of GP practices and their determinants, paving the way for effective measures to combat the overuse of psychotropic drugs.

ID 1068- Calliope study: Profile Comparison of Women with Substance Use Disorders in Specialized Addiction Centers versus Primary Care Microstructures

Adelaide PLADYS [(1)] , Daniele BADER [(1)], Deborah LOYAL [(2)], David FONTE [(2)], Marie-Lou STEFANOWSKI [(3)], Vincent ESTELLON [(2)], Perrine ROUX [(4)]

(1) Cnrms, Strasbourg, France
(2) Université Paris Cité, Paris, France
(3) Nouvelle Aube, Marseille, France
(4) Sesstim, Marseille, France

Context: Despite presenting greater medical and social vulnerabilities than men with substance use disorders (SUD), women with SUD remain underrepresented in addiction care structures in France. They account for only 20–30% of patients in specialized addiction centers (Centres de Soins, d'Accompagnement et de Prévention en Addictologie – CSAPA) and up to 50% in primary care "microstructures" offering multidisciplinary and coordinated medical, psychological, and social support.

Objectives: The Calliope study aims to explore and compare healthcare needs and satisfaction with healthcare among women with SUD according to the type of healthcare structure they attend (CSAPA vs microstructures).

Methods: Calliope is a prospective, multicenter, mixed-methods study combining quantitative and qualitative approaches. Participants were women aged ≥18 years, receiving medical follow-up for at

least six months for SUD in an addiction care structure, and living in one of four French regions (Occitanie, Grand Est, Île-de-France, Provence-Alpes-Côte-d'Azur).

Results: Between November 2024 and June 2025, 120 women were included in the quantitative phase: 85 in CSAPA (71%) and 35 in microstructures (29%). Compared with those in CSAPA, women in microstructures were older (median age 51 vs 43 years; p=0.01), more frequently single (71% vs 45%; p<0.001), and more often lived in personal housing (94% vs 66%; p<0.001). Women in CSAPA reported higher use of opioids (39% vs 20%; p=0.047), opioid antagonists (44% vs 21%; p=0.034), and cannabis (38% vs 17%; p=0.028), and tended to use more benzodiazepines (49% vs 31%). Satisfaction with care did not differ significantly between groups (CSQ-8 median score: 26 [24–26] in CSAPA vs 26 [25–27] in microstructures; p=0.2). Lifetime sexual violence was more frequent among women in CSAPA (72% vs 50%; p=0.024).

Discussion: These preliminary quantitative findings provide new insights into the profiles and care experiences of women with SUD in France, particularly those followed in microstructures, for whom few data were previously available. While satisfaction with care was high across all settings, differences in profiles and care pathways emerged.

Conclusion: The ongoing qualitative phase will further explore these findings and will shed light on women's lived experiences and on the perspectives of healthcare teams.

ID 595- Community health centers as a lever for integrating mental and primary care in France: insights from a Paris case study

Matthias BRUNN [(1)] , Wladimir HINDRYCKX [(2)], Elodie MALVEZIN [(2)]

(1) Belleville Health Center And Liepp-Sciences Po, Paris, France
(2) Belleville Health Center, Paris, France

Context: General practitioners in France face growing demands in mental health care despite limited access to psychologists, long psychiatric waiting times, and fragmented coordination between professionals. Community health centers (centres de santé, CDS) employ salaried multidisciplinary teams and may represent an underused tool to address these structural barriers, yet their contribution to mental health integration remains insufficiently documented.

Methods: We describe the Centre de Santé de Belleville (CSB), a CDS in Paris bringing together GPs, psychologists, and a psychiatrist within the same organization. Using internal activity data (2023–2025), annual reports, and national policy documents, we examined how the CSB organizes mental health access, referral pathways, and coordination. A structured SWOT reflection was used to identify system-level strengths and limitations. This single-case analysis is illustrative rather than generalizable.

Originality: While CDS exist nationwide, few incorporate substantial mental health capacity. The CSB's configuration—five psychologists, one psychiatrist, and eleven GPs serving a socially vulnerable population—offers an example of how CDS can position themselves betw

Lessons learned and future implication: For general practice, the CSB illustrates how multidisciplinary structures can facilitate access and organizational coordination for patients whose care pathways are often fragmented. The case also shows the constraints faced by centers relying on short-t

Discussion: This experience underscores the tension between the policy goals repeatedly expressed at national level—equity, coordination, integration—and the structural features of the French system that limit the diffusion of salaried, team-based primary care. The CSB case suggests that CDS can operationalize aspects of integrated care, but their contribution is shaped less by clinical performance than by institutional factors: financing models, professional power dynamics, and the historical weight of "liberal medicine." Scaling similar models would require clearer national frameworks, dedicated funding, and recognition of CDS as legitimate actors in mental health pathways.

Conclusion: Community health centers can serve as platforms for integrating mental and primary care

within primary care settings, but their broader role depends on supportive policies and sustained investment.

(2) Pharos, Radboud University Nijmegen, Nijmegen, Pays-Bas
(3) Ggdru, Utrecht, Pays-Bas
(4) Pharos, Utrecht, Pays-Bas

Context: Chronic stress has a far-reaching impact on health, behavior, and patient–provider interaction. In general practice, many patients present with complaints in which chronic, often hidden, stress plays an important role. Chronic stress is also a major driver of health inequalities, disproportionately affecting people in socially and economically vulnerable circumstances and contributing to persistent poorer health outcomes. Altough chronic stress is common, It is often difficult to recognize, explain clearly, and address effectively. To support general practitioners and practice nurses, the Dutch Centre for Health Disparities (Pharos) developed a training programme with conversation charts and animated videos. These materials were co-created with people with lived experience and public health experts to ensure accessibility and relevance for diverse patient populations.

Objectives: Recognize and interpret signs of stress during consultations Discuss causes of stress in a non-stigmatizing way Explain stress and its effects on body and behavior in understandable language, using visual tools Collaborate with patients on solutions, self-care, and referral when needed

Teaching method and workshop: The workshop uses case-based discussions, role-play consultations, conversation charts, and action-planning exercises to translate insights into daily practice. Schedule 0–10m Introduction Overview of workshop goals, relevance to general practice, an

Expected outcomes: Participants gain practical language and tools to address chronic stress directly in the consultation. Stress-sensitive working supports shared understanding, patient self-care, appropriate referral, and more person-centred, equitable, and integrated prim

Conclusion: Stress-sensitive working equips professionals with practical knowledge, shared language, and accessible tools to recognize and address chronic stress in everyday care. By combining theory, case-based learning, and experiential practice, this workshop supports more person-centred, equitable, and integrated care.

ID 2037- Moderate-to-high fatigue severity as an independent correlate of muscle strength and endurance among hospital employees

Hsin-Hsuan CHUNG, Hung-Keng WU, Yi-Wen TSAI

Department Of Family Medicine, Chang Gung Memorial Hospital, Linkou, No.5, Fuxing St., Guishan Dist., Taoyuan City, 333, Taiwan, Taoyuan City, Taïwan, République de Chine

Context: Fatigue is highly prevalent among healthcare workers and is associated with impaired health, reduced productivity, and increased occupational risk. Fatigue assessment using standardized scales may provide a practical approach for identifying workers at risk of functional decline and guiding workplace health promotion strategies. However, its association with objectively measured physical fitness remains unclear in occupational healthcare settings.

Objectives: This study aimed to examine whether moderate-to-severe personal or work-related fatigue, assessed using validated fatigue scales, is independently associated with physical fitness performance, such as muscle strength, muscle

endurance, flexibility, cardiorespiratory fitness, and grip strength among hospital employees.

Methods: In this multicenter, cross-sectional study, personal and work-related fatigue were assessed using validated scales, and participants were categorized into mild or moderate-to-severe fatigue groups. Independent t-tests were conducted to compare demographic characteristics and physical fitness parameters between fatigue groups. Multivariate linear regression analyses were performed to examine associations between fatigue severity and physical fitness outcomes, particularly muscle strength and muscle endurance, adjusting for potential confounders.

Results: A total of 365 hospital employees were enrolled, with a mean age of approximately 45 years. Compared with employees reporting mild fatigue, those in the moderate-to-severe fatigue group were significantly younger (43.2 vs. 46.1 years, $p < 0.05$), exhibited poorer muscle strength and endurance as measured by sit-up normative scores (3.54 vs. 3.94, $p < 0.05$), and had lower overall physical fitness scores (11.8 vs. 12.7, $p < 0.05$). After multivariable adjustment, moderate-to-severe fatigue remained independently associated with lower muscle strength and endurance ($\beta = -0.10$; 95% CI: −0.19 to −0.01; $p = 0.026$). Compared with employees reporting mild fatigue, those with moderate-to-severe fatigue demonstrated an approximately 0.1-point reduction in muscle strength and endurance performance.

Discussion: Fatigue severity, assessed using standardized scales, was independently associated with poorer muscle strength and endurance, suggesting that fatigue may capture aspects of functional health status not fully reflected by traditional cardiometabolic or anthropometric indicators.

Conclusion: Fatigue assessment may serve as a scalable and actionable tool for healthcare employers to identify workers at risk of functional decline and to guide targeted workplace health promotion and fatigue management strategies. Keywords (MeSH Terms) Fatigue; Physical Fitness; Workplace Health Promotion

ID 1922- The Science of Forgiveness: Implications for Primary Care Providers

Jane RICKS, Dan RICKS, Deann SADLEIR

Independant Researcher, Salt Lake City, États-Unis

Context: Scientific research on extending forgiveness to others is roughly 40 years old. Since its inception there have been thousands of articles written on the topic showing that extending forgiveness to others is good for one's personal physical and emotional health. Benefits include decreases in stomachaches, headaches, anxiety, depression, heart disease, diabetes, and more.

Objectives: 1) Review the important scientific literature on extending forgiveness. 2) Relate our experience of applying this information to incarcerated individuals.

Methods: Material in books, journal articles, and from the internet were reviewed. Important principles of extending forgiveness were collated. Focus was placed on health benefits of forgiveness and on the steps required to extend forgiveness to others.

Results: We identified skills that can help a person extend forgiveness and become a more forgiving person. Results of the research were written up into a course curriculum designed to be taught in 1-hour weekly group meetings over a 3-month period. This curriculum was integrated into Religious Services at the Utah State Correctional Facility, USA (UDC). Two cohorts completed the curriculum- one group of incarcerated men and one group of incarcerated women.

Discussion: The health benefits to the individual extending forgiveness are many. More importantly, the ability to extend forgiveness can be taught and can be learned. Our implementation of these principles at UDC exceeded our expectations. Women and men in our course were less angry and more accepting of the humanity of others after taking the course. Our experience parallelled those of inmates elsewhere who have learned how to forgive. Similar results exist with refugees, trauma victims, war survivors, and others.

Conclusion: Learning how to and the practice of extending forgiveness is a well-established means to improve the quality of life for those who have been injured. With the turmoil in today's world, these results are relevant to all of our patients. We suggest that information on forgiveness be readily available to PCPs to distribute to patients who express interest in such.

ID 1471- The psychotropics 10days: a National Awareness Campaign Promoting Rational Use of Antidepressants and Benzodiazepines in Belgium.

Ellen VAN LEEUWEN [(1)] , Lou RICHELLE [(2)], Anne-Marie OFFERMANS [(2)], Thierry CHRISTIAENS [(1)]

(1) Ghent University, Ghent, Belgique
(2) Université Libre De Bruxelles, Brussels, Belgique

Context: In Belgium, about one in ten people use an antidepressant (AD) and almost one in five use benzodiazepines or Z-drugs (BZRA), often for much longer than recommended. In 2025, the Psychotropics: 10 Days (Psychofarmaca 10-daagse / Psychotropes : 10 jours de sensibilisation) national campaign was launched for the first time from 1–10 October 25, during the 10 Days of Mental Health. The campaign promotes the appropriate use of ADs and BZRA, focusing not only on less initiation but also on more reviewing long-term use and discontinuing when appropriate.

Objectives: Increase awareness among healthcare professionals such as clinicians, pharmacists, and psychotherapists and patients about the risks of long-term AD and BZRA use. Facilitate communication between healthcare providers and patients regarding AD and BZRA.

Methods: Inspired by the Choosing Wisely movement, the campaign is clinician-led, evidence-based, and multidisciplinary, supported by professional associations of general practitioners, pharmacists, and psychologists, the Belgian Centre for Pharmacotherapeutic Information, the Belgian Psychotropics Expert Platform, and Ghent University. The four key calls to action were: (1) for sleep problems, start with non-pharmacological advice; (2) for depressive symptoms, start with dialogue before prescribing; (3) for long-term BZRA use, plan gradual tapering; and (4) for long-term AD use, review regularly. Campaign materials included a bilingual website (psychofarmaca10daagse.be / psychotropes10jours.be), visuals, downloadable posters ("Sleeping pills and antidepressants: start? forever?"), podcasts with Belgian experts on depression, sleep, and tapering, and videos.

Results: The campaign reached a broad audience of primary care professionals. Dissemination through newsletters of the professional organizations and social media increased visibility. The campaign website received over 3,500 visitors, and engagement with podcasts and videos was positive.

Discussion: The campaign raised awareness among healthcare professionals and encouraged dialogue about rational AD and BZRA use; however, yearly initiatives will be necessary, involving more partners across both regions of the country to ensure broader reach and sustained impact.

Conclusion: The Psychotropics: 10 Days campaign raises awareness and empowers healthcare professionals and patients to initiate and maintain open conversations about ADs and BZRA use. By fostering dialogue and providing evidence-based resources, the campaign contributes to promoting more appropriate use of ADs and BZRA in Belgium.

ID 1132- The impact of religiosity on the stigma of mental disorders among primary care nurses

Lazzat ZHAMALIYEVA, Assemgul BATYROVA, Galina VEKLENKO

West Kazakhstan Marat Ospanov Medical University, Aktobe, Kazakhstan

Context: Stigma of mental disorders (SMD) can negatively affect interactions with patients and the quality of care (Al-Natour A, 2021). Religiosity is believed to increase stigma because religionists interpret mental health problems as a punishment or test from God (alHarbi H, 2023). Islam is

perceived by the Kazakh population as part of their ethnic identity, although it does not have a dominant influence on people's behavior (Sultangaliyeva A., 1998).

Objectives: The aim of the study was to compare the SMD among nurses according to attitudes towards religion.

Methods: A survey study was conducted among 214 nurses in Western Kazakhstan. The average age was 36.8 (SD 11.3) years. 150 respondents considered themselves deeply religious, 36 did not profess any religion, the rest found it difficult to answer. SMD was measured in 14 statements on a Likert scale from “completely disagree” to “completely agree”. The questionnaire was created considering the cultural specificities of the country and meet high requirements for factor validation and reliability.

Results: We found no statistically significant differences between the responses of religious and non-religious nurses. Stigma in both groups regarding depression and suicide is higher than in European countries, but comparable to Asian indicators. Nurses in both groups equally believed that depression is a sign of weakness, on the one hand, but disagreed with their condemnation, on the other. Paradoxically, religious nurses were less likely to agree with the statement “Religion has condemned suicide in the harshest way for centuries, therefore, this is the right message for our time” than atheists (9.3% (95% CI 5-15.6%) vs 27.8% (95% CI 14.2-45.2%), RR 0.504 (95% CI 0.261-0.975), which, probably due to the peculiarities of Islam in Kazakhstan.

Discussion: Our study did not reveal a risk of discrimination against patients with mental disorders by nurses related to religiosity, but monitoring and preventive interventions in nursing education are needed.

Conclusion: SMD among nurses is widespread, but their religiosity does not worsen their attitude towards patients with mental illness. Further research in this area is needed to develop interventio ns to reduce SMD.

ID 685- Social workers’ perceptions about domestic violence against women during the Covid- 19 pandemic: A qualitative study from Jordan

Hana TAHA

Department Of Family And Community Medicine, School Of Medicine, The University Of Jordan, Amman, Jordanie

Context: Jordan is a lower-middle-income country with a population of 11.5 million (49% females). Eight out of ten (83%) live in cities and the rest in rural areas and desert. This study was conducted in Amman, the capital of Jordan that demonstrates the Jordanian's society sociocultural texture.

Objectives: Domestic violence affected women globally during the covid-19 crisis that changed the social and economic aspects of many humans’ lives. This study aimed to explore the perceptions of social workers about the effects of covid-19 pandemic and its restrictions on domestic violence in Jordan.

Methods: Qualitative study conducted from February to July 2022 in Amman, Jordan. The data were collected through individual in-depth interviews with 20 social workers who worked in different Family and Juvenile Protection centers throughout Amman city, to explore their perceptions about the status of violence against women during the coronavirus pandemic. The data was analyzed using latent content analysis.

Results: We were able to recognize two themes from the narratives; The First Theme was: Covid- 19 fear and restrictions aggravated the barriers and impacted reaching out and access to social services. This theme was built on two categories: Prevailing socio-cultural hushing especially among less privileged women; the victim’s ambivalence between the risk of exposure to the virus versus her fear from the perpetrator. The Second Theme was: COVID-19 pandemic and restrictions generated tremendous stress for victims, perpetrators, and social workers. This theme was constructed on four categories: the increase in the incidence of domestic abuse during the pandemic; the increase of socio-economic hardships; the increase in alcohol and drug abuse by victims and their abusers; and the social workers’ concern about the accessibility to ask for help during the quarantine.

Discussion: There has been a noticeable increase in domestic violence in Jordan during covid-19 crisis attributed to many factors such as spending a lot of time with the abusers and tremendous difficulty to access family protection departments.

Conclusion: Empowering women and providing psychosocial support to both victims and perpetrators can prevent and decrease the hazardous impact of domestic violence. This is crucial to protect vulnerable women and save their lives during crisis.

ID 2003- Collaboration between family physicians and community structures to promote equity in disadvantaged and migrant populations

Joana MATOS BRANCO, Cristiana LOPES CRAVEIRO, Alexandra PINTO ROCHA, Cintia RAMOS ALVES, Érica TRIBUNA, José LIMA, Inês MARQUES PIRES

Usf Águas Livres, Uls Amadora Sintra, Lisboa, Portugal

Context: Socioeconomic deprivation and migration are major determinants of health inequalities. Populations living in economically disadvantaged areas, particularly migrants from African countries, often face significant barriers to healthcare access, including language difficulties, cultural differences, low health literacy and social vulnerability. In this context, family physicians working in primary care are uniquely positioned to promote health equity through coordination of care and collaboration with community structures.

Methods: This practice-based case is based on a descriptive and reflective analysis of clinical practice in a primary care center located in an economically deprived area with a high proportion of patients of low socioeconomic status and migrants from African countries. Collaborative practices with community structures were analyzed, including social services, local authorities, schools, non-governmental organizations and community mediators. A narrative review of the literature on community-oriented primary care and social determinants of health supported the analysis.

Originality: Rather than focusing on a single intervention, this case highlights how structured and sustained collaboration between family physicians and community resources can be integrated into routine primary care. It illustrates the role of family medicine as a b

Lessons learned and future implication: Collaboration with community structures enables earlier identification of social vulnerability, improves access to healthcare and increases adherence to care plans. Cultural mediators play a key role in improving communication and health literacy. Strengt

Discussion: The findings reinforce the relevance of a community-oriented primary care model in socially and culturally complex contexts. Family physicians are well placed to identify social determinants of health and mobilize community resources accordingly. However, effective intersectoral collaboration depends on cultural competence, mutual trust and regular communication between healthcare professionals and community partners.

Conclusion: Effective collaboration between family physicians and community structures is essential to address health inequalities in socioeconomically disadvantaged and migrant populations. Strengthening community partnerships promotes equity, improves health outcomes and supports sustainable, person-centered primary care.

ID 1849- Primary Health Care and Migrants: Barriers, Potentialities, and the Challenge of Equity – An Integrative Review

Tatiana FIUZA [(1)] , Helena RIBEIRO [(1)], Marco Túlio RIBEIRO [(1)], Sónia DIAS [(2)], Mariana GONÇALVES [(3)], Francisco Daniel VIANA [(4)]

(1) Universidade Federal Do Ceará, Fortaleza, Brésil
(2) Escola Nacional De Saúde Pública De Portugal, Lisboa, Portugal
(3) Fiocrz, Rio De Janeiro, Portugal
(4) Fiocrz, Rio De Janeiro, Brésil

Context: International migration, often involuntary, has a profound impact on the social determinants of health and presents significant challenges to health systems. Primary Health Care (PHC), as outlined in the Alma-Ata Declaration, plays a central role by providing essential, accessible care that encourages community participation. The quality of PHC depends on four core attributes — first-contact access, longitudinal comprehensiveness, and care coordination — and three derived attributes — family orientation, community orientation, and cultural competence — all crucial to meeting the needs of migrant populations.

Objectives: Conduct an integrative literature review on migrations and principles of Primary Health Care.

Methods: An integrative literature review was conducted to explore how PHC attributes influence care for migrants, identifying challenges and potentialities. The six classical methodological steps were followed: question formulation, search, categorisation, appraisal, interpretation, and synthesis. Searches were performed in BVS, LILACS, and SciELO using five strategies with DeCS descriptors in English and Portuguese. Full-text, open-access studies published between 2019 and April 2024 were included. Of 380 articles identified, 34 were analysed in full. The findings were interpreted in according to PHC attributes. As the study did not involve human participants, ethical approval was not required.

Results: Migrants and refugees face persistent barriers to accessing PHC, including communication difficulties, lack of knowledge about services, stigma, discrimination, cultural differences, absence of documentation, costs, transportation challenges, and healthcare workforce overload. Female migrants face specific challenges in sexual, reproductive, and mental health. Potentialities identified include culturally sensitive practices, continuing education, cultural competence, community support, care facilitators, and strengthened links between health services and social organisations. Universal access depends on addressing inequalities, implementing specific public policies, and reinforcing PHC as the entry point, with strategies that promote active listening, continuity, and comprehensive care aligned with principles of equity.

Discussion: Access is the most frequently studied PHC attribute, representing the first contact with services. However, access alone does not ensure quality care; an integrated approach considering all PHC attributes is necessary to enhance care for migrants and strengthen primary health care.

Conclusion: The study points to the need for research that delves into comprehensive care for migrants and primary care beyond access.

ID 1243- Primary care and community-based interventions to enhance migrant health screening: An international evidence map of current practice

Felicity KNIGHTS [(1)] , Jessica CARTER [(1)], Alice DOORLY-WATSON [(1)], Liza BOWEN [(1)], Umar CHAUDHRY [(1)], Julia CRITCHLEY [(1)], Tess HARRIS [(1)], Daniel KNIGHTS [(2)], Sally HARGREAVES [(1)]

(1) City St George's, London, Royaume-Uni
(2) University Of Cambridge, Cambridge, Royaume-Uni

Context: Migrants have been acknowledged to face a 'triple-burden' of infectious diseases, non-communicable diseases and mental health conditions. However, screening coverage across migrant populations in many high-income migrant-receiving countries remains low. This evidence map aims to identify the current state of research concerning migrant health screening in community and primary care settings.

Objectives: - To map evidence on current practice in screening migrant populations in high income migrant-receiving countries - To identify which diseases are included, which migrant groups are being screened, and which interventions are

involved in reported screening models - To understand changes in approach to screening of migrant groups over the last decade

Methods: A comprehensive literature search of MEDLINE, Embase, Global Health, PsycINFO and Cochrane was conducted on 12th July 2024, supplemented by handsearching relevant systematic reviews and key conference proceedings in migrant health in the last decade. Identified papers were mapped according to migrant group, country, disease and type of intervention, and trends over time were assessed.

Results: Of 17,324 unique records, 607 primary studies met our inclusion criteria, of which 52.06% (307) screened for an infectious disease, 37.07% (225) screened for non-communicable disease and 18.29% (111) screened for a mental health conditions. 79.90% (485) screened only for one condition. The majority aimed to enhance access or used promotion techniques, but the use of community health workers and point-of-care testing has risen across the last decade.

Discussion: Most published screening programmes for migrants addressed infectious diseases, however, participatory research has shown that mental health and non-communicable diseases are considered of equal or greater importance to migrant groups. In common with other screening programmes, most studies screened for a single condition. However, combining screening for multiple diseases in migrant groups has been promoted in recent professional guidance. Existing literature demonstrates an increasing interest in the use of point-of-care testing for marginalised groups, but in migrants there are few studies seeking to evaluate effectiveness in linkage to care or longer-term health outcomes.

Conclusion: This evidence map identifies the need for future large-scale studies in primary care and community settings that report on multi-disease screening interventions, linkage to care, and impact on health outcomes.

ID 1392- How are migrants involved in health decision-making in Italy? A narrative review to inform primary care governance

Gabriele GAZZANEO [1] , Giulietta Luul BALESTRA [2], Giusy IORIO [2], Luca GHIROTTO [2], Fatna ARIA [3], Marina SPARANO [4], Francesca BONVICINI [4], Benedetta RIBOLDI [5], Federica VIOLI [4]

(1) Postgraduate School Of Community Medicine And Primary Health Care, University Of Modena And Reggio Emilia, Modena, Italie
(2) Qualitative Research Unit, Azienda Usl-Irccs Di Reggio Emilia, Reggio Emilia, Italie
(3) Nephrology And Dialysis Unit, Azienda Usl-Irccs Di Reggio Emilia, Reggio Emilia, Italie
(4) Primary Health Care Department, Azienda Usl-Irccs Di Reggio Emilia, Reggio Emilia, Italie
(5) Health And Social District Of Reggio Emilia, Azienda Usl-Irccs Di Reggio Emilia, Reggio Emilia, Italie

Context: In Italy, people with migrant backgrounds face significant health and access inequities, while their involvement in decisions about services, research and policies remains under-explored. Health strategies increasingly mention participation and co-production, but the actual levels and scenarios of migrant influence are unclear. Within the RADICE participatory action-research project we conducted a narrative review to inform local primary care processes

Objectives: To map how migrants in Italy have been involved in health-related decision-making at micro and macro levels; to describe participation mechanisms and outcomes; and to identify gaps and promising practices for equity-oriented primary care governance.

Methods: We conducted a narrative review of peer-reviewed primary studies on migrant participation in health decision-making in Italy. We included empirical studies reporting any involvement of migrants or migrant-led organisations in decisions on health policies, service design, priority-setting, research agendas or governance. Two reviewers screened sources from biomedical and social science databases and extracted data on context, actors, decision-making arena, participation modalities and level of influence for narrative synthesis.

Results: Preliminary analysis suggests that documented experiences are concentrated at micro and project level, focusing on consultation or involvement in time-limited initiatives, often mediated by NGOs or cultural mediators. Migrants

seldom participate in formal governance structures or in decisions on resource allocation, and their role in research priority-setting appears almost absent. Evidence from primary and community care is limited and geographically uneven, with few long-term initiatives explicitly addressing power-sharing, accountability or structural racism.

Discussion: The review underscores a gap between policy rhetoric on participation and the marginal, often tokenistic role assigned to migrants in actual decision-making. A small set of more transformative experiences, where migrants contribute to agenda-setting or co-design, offers concrete lessons for redesigning participatory spaces within primary care and local health systems.

Conclusion: By the conference, we expect to present the full synthesis of this review and apply its findings to the first participatory cycles of the RADICE project in Reggio Emilia. The work supports primary care teams in moving from ad hoc consultation to structurally embedded, equity-oriented migrant participation in health governance.

ID 1056- Health status of residents in two migrant worker hostels, descriptive study based on the X project conducted in primary care in Paris area

Sarah ROBERT, Kim BONELLO, Hada SOUMARE, Juliette VIEILLE

Sorbonne University, Paris, France

Context: Migrant worker hostels (MWHs) were created in the 1960's in France to accommodate workers of foreign origin. Their residents accumulate risk factors for their health, and their state of health has been never studied.

Objectives: Describe the health status of MWHs residents at the time of inclusion in the X project. Investigate socio-economic factors associated with their health status.

Methods: Project X is an outreach study conducted in primary care among residents of two MWHs in Paris area. The aim of this study is to conduct workshops on the theme of health in the two MWHs over a period of one year and to evaluate this intervention. A cross-sectional, quantitative study was conducted to collect baseline data from volunteer residents (adults sleeping at least 4 nights in the MWHs) at inclusion. Data collection was carried out by a multidisciplinary primary care team (general practitioners, nurses, social worker, advances practice nurses) in French, Arabic and Soninke. The primary endpoint was health status, measured using the European mini-module. Health literacy was assessed using the HLS-EU-Q16. Descriptive, comparative (Chi2) and multivariate (logistic regression) analyses were performed using R software. The study received GIRCI funding and approval from the ethics committee.

Results: Among the 107 residents included, the average age was 47. 70% had a general practitioner, and 45% reported poor health. In multivariate analysis, poor health was significantly associated with low health literacy, advanced age, isolation, and time spent in France.

Discussion: The use of validated tools and the presence of multilingual professionals are strengths of the study. The recruitment methods (languages, schedules) may have led to selection bias and limited the inclusion of supernumerary residents.

Conclusion: This study provides a better understanding of the health determinants of MWHs residents. Improving their health literacy could enhance their ability to navigate a complex healthcare system in order to improve their health. This hypothesis is the subject of the second part of the project: an outreach intervention to promote health literacy.

ID 909- Pictogram-based health education to improve health literacy among migrant women in rural primary care

Frine SANTOS CAMINERO [(1)] , Irene PINOS GARRIDO [(2)], Avelina M. GARRIDO CALVO [(3)], Luis A PEÑA ORDOÑEZ [(3)], Marianela ARIAS HUALPA [(3)]

(1) Familiy Medicine Resident, Aldenaueva De Ebro, Espagne
(2) Psychologist, Speech And Language Therapist, Aldeanueva De Ebro, Espagne
(3) Family Medicine Doctor And Resident´s Tutor, Aldeanueva De Ebro, Espagne

Context: A primary care team identified a group of migrant women living in a rural environment who faced communication barriers, limited familiarity with the health system and frequent use of emergency services for non-urgent symptoms. Many had difficulty understanding verbal explanations, navigating appointments and following preventive advice. These challenges highlighted a need for accessible, culturally sensitive health education adapted to low-literacy contexts.

Methods: A monthly sociosanitary education programme was implemented using pictograms as the principal communication tool. Participants represented a wide range of ages, languages and cultural backgrounds. The sessions addressed chronic disease management, hypertension, obesity, contraception, fever management, child care, emotional wellbeing, diet, physical activity and appropriate use of emergency services. Pictograms were used to illustrate symptoms, alarm signs, medication instructions and lifestyle recommendations. The programme was facilitated by a multidisciplinary team including family medicine, nursing, social work, psychology and speech therapy. Attendance was voluntary, and participants were encouraged to share doubts about previous healthcare encounters or difficulties understanding medical guidance. The visual format allowed immediate clarification of misunderstandings and enabled women with limited literacy to participate actively.

Originality: Although pictograms are commonly used in paediatric and disability settings, their systematic application for adult migrant health education in primary care is uncommon. This experience showed that visual communication can effectively bridge linguistic an

Lessons learned and future implication: The group format fostered mutual support, empowerment and increased confidence in interacting with healthcare professionals. Several participants reported improved understanding of when to seek primary care instead of emergency services and expressed grea

Discussion: This experience highlighted structural barriers affecting migrant women and demonstrated how primary care can promote equity through accessible, humanistic communication strategies.

Conclusion: This experience demonstrates how adapted communication tools can reduce barriers and improve engagement in primary care for migrant women.

ID 29- Needs and expectations among migrant patients suffering from sexual, psychological, and physical violence from two health centres in Paris.

Antoine THYSSEN [(1)] , Astrid Elisabeth GRAS [(2)]

(1) Main Author, Paris, France
(2) Co Author, Paris, France

Context: The international flow of migration from Africa and the Middle East to Europe has risen due to war, religious, and ethnic conflicts. As a result, the prevalence of violence is high, with terrible consequences on the health of the migrant population. Above all, these consequences are worsened by inequality and difficulties in accessing the healthcare system in France.

Objectives: Improving the structuring of care in two medico-social dispensaries among migrant populations suffering from violence, by identifying their medical, psychological, and social needs and expectations.

Methods: Twelve patients were interviewed (phenomenological qualitative method).

Results: Patients did not systematically recognize the impact of violence on their health or the connection between their health concerns and their experience of violence. Additionally, their

experience of violence and the screening process were perceived differently by patients, ranging from rejection to acceptance. Furthermore, their understanding of health varied over time and improved with the advancement of care. Having received care from the centres, patients had better access to physicians in both primary and secondary care sectors, although significant ongoing difficulties remained. Patients expressed a desire to be seen directly by more specialists at the centre, such as infectiologists, and to receive more information about sexual health and LGBTQIA+ rights. Most of the patients were socially isolated despite having access to various non-profit and charitable organisations. When they arrived in France, the patients needed to maintain ties with their cultures by continuing to use their native languages. Their cultural integration in France was primarily achieved through learning French.

Discussion: This study proposes a fresh consideration of structured care through the induction of a health mediator during the first consultation so as to ascertain patient vulnerabilities. The patient is systematically seen by a general practitioner, social worker, and psychologist. A pluridisciplinary staff organises the specific medical, psychological, and social care.

Conclusion: Access to migrant patient needs and expectations in view of their medical, psychological, and social care was granted. A new structured care paradigm for migrant patients experiencing violence has been established.

ID 2195- Use of bibliotherapy in general medicine. Opinion survey among general practitioners.

Line RIQUEL [(1)] , Clément DUSART [(2)]

(1) Ufr Santé, La Rivière Saint-Louis, Réunion
(2) Ufr Santé, Saint-Pierre, Réunion

Context: Bibliotherapy refers to the use of written materials for therapeutic purposes. The curative effect of books, mentioned as early as antiquity, has been objectified by several studies. It is widely used in England in primary care whereas in France it appears to be used to a limited extent. The main objective of the study was to assess the state of knowledge and the use of bibliotherapy by general practitioners.

Methods: An opinion survey was conducted with a digital questionnaire. The target population included all liberal generalists in Reunion Island. A sample was collected using records of email addresses. The data collection was anonymous

Originality: One of the strengths of our work has been to raise awareness among some practitioners about this little-known practice.

Lessons learned and future implication: 68 responses were collected. The sample seemed representative of the target population in terms of sex and age. 43 doctors (63%) had already used books in consultation, especially for patients with psychological disorders. The main obstacles which could b

Discussion: The term bibliotherapy is not widely known; many doctors had already used books during consultations. This approach seems to be well received by patients. The HAS (French National Authority for Health) mentions bibliotherapy among the treatments for anxiety disorders. Books are a valuable tool for accessing conventional therapies, given the difficulties they face, and for promoting therapeutic education based on books.

Conclusion: Our study made it possible to draw up an unprecedented inventory of this practice.. The majority of the doctors who were surveyed had already used it in cases of psychological disorders. In order to develop this practice, a reference frame of books should be created to guide general practitioners and patients in their choice. Keywords Bibliotherapy, media-assisted therapy, primary care

ID 1449- Spiritual Health Awareness and Recommendations in Primary care- The SHARP training. A co-designed

intervention to promote liberty, equity and fraternity in spiritual health

Ishbel Orla WHITEHEAD

Newcastle University, Newcastle Upon Tyne, Royaume-Uni

Context: Spiritual health is recognised as a core component of whole-person care, and is associated with positive outcomes when addressed and negative consequences when overlooked. Despite this, primary-care clinicians often report low confidence, uncertainty, and stigma when discussing spiritual health in consultations. This hesitation is reinforced by pluralistic ignorance: clinicians privately value spiritual health but feel unsure how to raise the topic professionally. Evidence highlights a training gap within primary care.

Objectives: To co-design an evidence-based, pragmatic training that addresses learning needs around spiritual health. The intervention aims to promote liberty of belief and practice, equity of access to spiritual-health support, and fraternity through shared learning and mutual respect.

Methods: We used the Person-Based Approach (PBA), informed by Normalisation Process Theory (NPT), to co-design a practical and implementable training package: the SHARP (Spiritual Health Awareness and Recommendations in Primary care) Training. Five workshops were delivered online and in-person at Newcastle University, UK, involving GPs, social prescribers, patients, and community stakeholders. Workshops followed a structured agenda and used persona-based discussion and narrative pedagogy to explore the best ways for spiritual health training to be delivered, and identify "norm brokers" to embed good practice. Iterative prototyping combined stakeholder insights with evidence-based content.

Results: Co-design produced a usable, scalable training aligned with real life practice. Participants reported that the structured yet flexible approach reduced stigma, normalised discussion of spiritual health, and enhanced conceptual clarity. Integrating NPT ensured the intervention addressed coherence, cognitive participation, collective action, and reflexive monitoring. SHARP offers evidence-based content, practical communication strategies, and implementation supports to enhance acceptability and normalisation. Dissemination through an international CPD provider is planned.

Discussion: SHARP shows that sensitive and contested topics can be addressed constructively when liberty, equity and fraternity guide the process. SHARP enables clinicians to explore diverse beliefs safely (liberty), supports fair and consistent spiritual health care awareness (equity), and develops shared understanding and collaboration within primary care (fraternity). These principles help shift a stigmatised topic into a legitimate and relational component of holistic care.

Conclusion: The SHARP training is being piloted and evaluated to support equitable access to spiritual-health education and strengthen whole-person care in primary care settings.

ID 999- Prescriptions of anxiolytics, hypnotics and antidepressants by general practitioners practising hypnotherapy: a cross-sectional study of reimbursement data.

Benjamin BASTIAN, Sarah-Lou MAMOUNE, Eric MENER

Department Of General Practice, University Of Rennes, Rennes, France

Context: Anxiolytics, hypnotics and antidepressants are prescribed mainly by general practitioners (GPs). They cause numerous adverse effects and represent a burden on public health and healthcare budgets, especially as they are often overused in comparison with guidelines. The use of non-pharmacological interventions is recommended as a first-line treatment in most non-severe situations where these substances are prescribed, but they remain significantly underused. XXXX hypnotherapy is a formally described hypnosis method used in primary care that could represent a new and serious therapeutic alternative in this context.

Objectives: To compare the characteristics of prescriptions for anxiolytics, hypnotics and antidepressants issued by GPs who practise XXXX hypnotherapy (HGPs) in the YYYY region with those issued by untrained GPs, as well as those issued before and after their training.

Methods: Cross-sectional study of reimbursement data from YYYY health database for these treatments in 2023. Prescriptions from all the 22 YYYY HGPs were compared with those of 88 other matched GPs, and one year before versus two years after training in a second longitudinal study.

Results: In 2023, HGPs were involved in 15.42 [12.19-19.31] deliveries of anxiolytic benzodiazepines and 4.47 [3.30-6.02] deliveries of hypnotics on average for every 100 different patients seen, versus 20.64 [17.18-24.58] and 7.63 [6.44-9.02] for others (p=0.475 and p=0.0016, respectively). The treatment duration for benzodiazepine anxiolytics was in line with guidelines for 92.12% [89.15%-94.33%] of HGPs versus 87.79% [85.14%-90.03%] of others (p=0.0252). No difference was observed in antidepressants nor in HGPs' prescriptions before and after training.

Discussion: To our knowledge, the characteristics of prescriptions issued by GPs practising hypnotherapy had never been objectively evaluated until now. Despite its small sample size, this study represents an exhaustive survey of YYYY GPs using this hypnosis method and reveals that these physicians have a specific profile of psychotropic drug prescriptions. However, no causality can be established here between the practice of hypnotherapy and changes in physicians' drug prescribing habits, and results cannot be extrapolated to other hypnosis methods.

Conclusion: Hypnosis might be a complementary therapy that reduces the need for psychotropic drugs, especially when performed directly by GPs, but its impact on practices needs to be studied further.

ID 1169- Integration of Ayurvedic Lifestyle (Dinacharya) in Primary Care for Stress and Sleep Disorders: A Mixed-Methods Evaluation

Sameer JOSHI [(1)] , Prathamesh KOTAGI [(2)]

(1) Associate Professor, Ponda, Goa, Inde
(2) Assistant Professor, Kolhapur, Maharashtra, Inde

Context: Stress-related conditions and sleep disturbances are highly prevalent in primary care and are major contributors to reduced well-being and increased healthcare use. Standard treatments often alleviate symptoms but may not sufficiently address underlying lifestyle factors. Ayurvedic lifestyle guidelines (dinacharya) emphasize circadian alignment, behavioral regulation, and preventive self-care, offering a potentially feasible, low-cost adjunct for primary care.

Objectives: To assess the effectiveness and acceptability of a structured ayurvedic lifestyle intervention in reducing stress and improving sleep quality among adults presenting to primary care.

Methods: A mixed-methods study was conducted in an urban primary care setting. Adults aged 20–50 years with moderate stress (Perceived Stress Scale [PSS] >18) and sleep disturbance (Pittsburgh Sleep Quality Index [PSQI] >5) were recruited. Participants received individualized lifestyle recommendations grounded in ayurvedic principles, including sleep hygiene strategies, circadian routine alignment, dietary regulation, guided breathing practices, and structured digital-detox routines for 6 weeks. Quantitative outcomes included PSS, PSQI, and a 10-point subjective sleep satisfaction rating. Pre- and post-intervention changes were analyzed using descriptive statistics and paired t-tests. Semi-structured interviews explored perceived acceptability and implementation experiences, analyzed using thematic content analysis.

Results: Among 52 enrolled participants, 48 completed follow-up. Mean PSS scores decreased significantly from 22.4 to 14.8 ($p < 0.001$). Mean PSQI scores improved from 9.1 to 5.3 ($p < 0.001$). Eighty-five percent of participants reported better daytime functioning and improved sleep satisfaction. Qualitative analysis identified high acceptability, increased perceived self-efficacy, and the practicality of adopting structured lifestyle routines as key facilitators.

Discussion: The intervention demonstrated clinically meaningful improvements in stress and sleep quality, with strong participant endorsement and alignment with core principles of person-centred primary care. The mixed-methods design strengthened understanding of both effectiveness and implementation feasibility.

Conclusion: A dinacharya-based lifestyle intervention appears feasible, acceptable, and effective as a low-resource adjunct for managing stress and sleep disorders in primary care. Controlled comparative studies are warranted to confirm efficacy and support broader integration into routine practice.

ID 854- Dancing One Health: transdisciplinary reflections from the confluence of expanded dance practices, somatic approaches and ancestral indigenous knowledge

Rosane VIANNA-JORGE, Lidia Costa LARANGEIRA, Ruth Silva Torralba RIBEIRO, Elaine Vieitas CRUZ, Alice Magaldi Teixeira LEITE, Giulia Lucas SILVA, Juliana Cristina Moreira VIEIRA, Letícia Almeida VIANA, Alecsander Vasconcelos CORREIA, Júlia Maria Costa Silv

Universidade Federal Do Rio De Janeiro, Rio De Janeiro, Brésil

Context: The present study reflects on the transdisciplinarity between Dance and Health, from the research experience on expanded dance practices developed by XXX, a gathering of artists, scholars, researchers and students from Dance, Psychology, Public Health and Biological Sciences, in partnership with XXX, a pluriethnic indigenous community and university located in urban context, in XXX. Our research considers Dance under the paradigm of One Health, recognizing the symbiotic interconnection between humans, other living beings and environmental elements of the planet.

Methods: The study consisted of a cartographic research into the creation and exercise of contrachoreographic practices in dance, called practices of “beingwith”, which are grounded in the politics of encounter, with horizontal relationships in networks of affection and care between people, living beings, and physical elements of their territories.

Originality: The practices of “beingwith” were originally elaborated in the indigenous university, integrating somatic and relational exercises (somaffective experiences) with ancestral knowledge, attentively investigating the interconnections between body, territory

Lessons learned and future implication: Our investigation focuses on the movements, gestures, sensations, and perceptions arising from shared experiences of care that emerge within communal activities that are closely integrated with the environment. Such praxis is inspired by the indigenous no

Discussion: Based on the transdisciplinarity between Dance and Health, our research proposes to add somaffective, cartographic, and artistic experiences to care practices that develop in the strengthening of collective networks and in the deepening of community integration with inhabited territories and spaces of coexistence.

Conclusion: We propose that the practices of "beingwith" expand the perception of the modes and meanings of transpersonal relationships that make up planetary life, fostering integration and belonging, creating a regenerative potential for global health.

ID 148- Effect of Music-Based Intervention on Distress in Cancer Patients Undergoing External Beam Radiation Treatment at a Radiation Oncology Center in a Tertiary Hospital: A Randomized Controlled Trial

Marife CEBRIAN

Perpetual Help Medical Center-Las Pinas, Las Pinas, Philippines

Context: Distress is common among cancer patients receiving external beam radiation therapy (EBRT), yet evidence for music-based interventions in this setting is limited.

Objectives: To evaluate the effect of a music-based intervention on distress levels in adult cancer patients undergoing EBRT. Secondary objectives were to describe patient clinical and sociodemographic profiles, assess distress using the NCCN- Distress Thermometer before CT simulation and planning and after the 10th radiotherapy fraction, and explore correlates of change in distress.

Methods: This was a randomized, controlled open label clinical superiority trial with two parallel arms and a pre-post assessment. Adult cancer patients (18–60 years) receiving first-time EBRT were recruited from May 2025 to September 2025. Eligible participants were randomized using a computer-generated sequence. The primary outcome was the change in distress score (NCCN-DT) from pre- to post-intervention.

Results: Forty-six patients were randomized to a music-based intervention (n = 23) or non-music based intervention (n = 23) group, with well-matched baseline characteristics. The attrition rate was 13% in the music-based intervention (3/23), 4% in non-music-based intervention (1/23), and 8% overall (4/46). The music-based intervention group showed a significantly greater reduction in distress scores compared to control in both per-protocol (mean difference = 2.63, p=0.0008) and ITT analyses (mean difference = 2.67, p=0.0010). Depression rates did not differ between groups. Patients in the music-based intervention group were significantly more likely to show improvement in distress (per-protocol RR=4.13, p=0.0005; ITT RR=3.75, p=0.0023). Multivariable analysis identified music-based intervention as the sole significant predictor of improvement (OR=19.03, p=0.006).

Discussion: Listening to Bach's BWV1049 reduced heart rate and reduced the sympathetic nervous activity, as indicated by a lower Low Frequency/High Frequency ratio, suggesting suppression of the "fight or flight" response and induction of relaxation via central autonomic pathways. The main strength of this study is its well-structured randomized controlled trial design with well-matched groups, validated outcome measures, robust statistical analyses, and low attrition, all of which enhance the credibility and generalizability of the findings.

Conclusion: Music-based intervention is a simple and effective strategy for alleviating distress in adult cancer patients undergoing radiotherapy and should be considered in the patient-centered oncologic standard of care.

ID 113- Perceptions and Attitudes of Patients and Family Physicians Toward Background Music During the Medical Encounter

Said DARAWSHA

Maccabi Health Services, Arraba, Israël

Context: Music is an integral part of human life and has been increasingly incorporated into healthcare due to its documented benefits for both patients and professionals. Studies indicate that background music in clinical environments can reduce anxiety, improve mood, relieve pain, and enhance overall well-being. In family medicine, where consultations are often personal and continuous, background music may help reduce stress for both patients and physicians, foster empathy, and enhance communication. Despite the growing recognition of its therapeutic potential, little research has examined the perspectives of both patients and family physicians in ambulatory settings.

Objectives: To explore the attitudes, perceptions, and preferences of patients and family physicians toward the use of background music during medical consultations.

Methods: This descriptive, questionnaire-based study will recruit approximately 300 patients and 15 family physicians from Maccabi Health Services clinics. Participating physicians will conduct a series of consultations accompanied by standardized

background music. After each visit, patients will complete an anonymous questionnaire assessing satisfaction, comfort, and attitudes toward the use of music. Physicians will complete a separate questionnaire at the end of the study period. Quantitative data will be analyzed using descriptive statistics, chi-square tests, t-tests or Mann–Whitney tests, and multivariate logistic regression to identify factors associated with satisfaction.

Results: Data collection and analysis are ongoing. Preliminary findings are expected to show that most patients and physicians express positive attitudes toward background music, linking it to reduced anxiety, improved mood, and a more pleasant clinical environment.

Discussion: Preliminary insights suggest that background music may serve as a simple, low-cost, and non-invasive method to enhance the therapeutic atmosphere and patient–physician interaction in family medicine. It could reduce stress, increase empathy, and improve satisfaction for both patients and doctors. These results align with previous research emphasizing the psychological and physiological benefits of music in hospital settings, yet highlight its underexplored value in primary care.

Conclusion: Background music in family physicians' offices appears to be a promising intervention to humanize medical encounters, promote comfort, and strengthen communication. Future studies should further define optimal music characteristics—such as genre, volume, and cultural suitability—to guide evidence-based implementation of music in everyday clinical practice.

ID 2268- LIDIAS: A personalized smartphone lifestyle application for depression symptomatology in general practice

Marcia SPOELDER [(1)] , Tim OLDE HARTMAN [(1)], Suzanne LIGTHART [(1)], Pim ASSENDELFT [(1)], Otto MAARSINGH [(2)], Susanne YOUNG [(2)], Huib BURGER [(3)], Eline JAGTENBERG [(1)], Otto MUILWIJK [(1)]

(1) Radboudumc, Nijmegen, Pays-Bas
(2) Amc, Amsterdam, Pays-Bas
(3) Umcg, Groningen, Pays-Bas

Context: Research indicates that lifestyle interventions can be effective for individuals experiencing symptoms of depression in primary care, with some demonstrating effects comparable to medication and cognitive behavioral therapy. However, a structured approach to providing lifestyle advice and evaluating its effects remains lacking.

Objectives: To investigate whether a personalized lifestyle intervention (PLI) delivered via a smartphone application is a (cost-)effective addition to current depression treatment in general practice.

Methods: First, through a qualitative study with both interviews and focus groups, we developed the smartphone application in collaboration with patient representatives, general practitioners (GPs), GP mental health practice nurses (GP-MHNs) and a software developer. Second, a short pilot was performed to test its feasibility. Finally, the PLI will be tested in a cluster randomized controlled multicenter clinical trial (RCT), in which we will compare usual care with usual care plus the PLI. The PLI includes: 1) a short lifestyle questionnaire based on six pillars (mental wellbeing, harmful substances, social relationships, eating, sleep and physical activity), 2) a visualization of the results of the questionnaire, leading to formulation of two personal lifestyle goals 3), information and advices on these personal goals and 4) integration of depression symptomatology measurements over time. GPs and GP-MHNs can track the progress of the patient through their own account. Adults with mild to severe depression symptomatology are being included. The primary study parameter is change in severity of depression symptoms, assessed by the PHQ-9. Secondary outcome measures include cost-effectiveness, quality of life, functioning, relationship with the healthcare provider, and patient satisfaction.

Results: During the interviews and focusgroups, three main topics were found: 1) perspectives on lifestyle, 2) recovery process, 3) practical usability and app implementation. For the RCT, we have

currently included 53 patients, and are able to present the first results during WONCA Paris.

Discussion: Our results thus far identified obstacles and facilitators for the effective use and implementation of a personalized lifestyle intervention aimed at reducing depressive symptoms in patients in general practice.

Conclusion: Overall, we hypothesize that in patients with depression symptomatology, the PLI as addition to usual care will help reduce symptoms in a (cost-)effective way.

ID 2109- A Personalised Digital Self-Management Tool to Improve Wellbeing and Reduce Primary Care Demand

Marine MERCADIÉ

Université De Bordeaux, Bordeaux, France

Context: Homeopathy is currently widely used in general practice worldwide, notably in Brazil, India, and Switzerland, despite the lack of evidence demonstrating efficacy beyond placebo. However, from its very inception in early nineteenth-century Germany, homeopathy was met with substantial skepticism, and as early as 1835 it was subjected to a rigorous evaluation in what is now recognized as the first randomized, double-blind, controlled trial in the history of medicine. Unfortunately, the original report of this experiment, published in a German newspaper, has never been fully translated, and is only briefly mentioned in a small number of secondary sources. As a result, this foundational event in the history of medical science remains largely unknown to contemporary clinicians and researchers.

Objectives: This work aims to translate and analyze this historical trial through the modern lens of general practice, with methodological, historical, and clinical perspectives.

Methods: The complete text, "Die homöopathischen Kochsalzversuche zu Nürnberg", was fully translated, first using a literal approach supported by historical dictionaries, followed by a fluent translation into contemporary French. Specific translation challenges were identified and discussed. The methodological aspects of the experiment were analyzed in relation to current gold standards in general practice research.

Results: Remarkably, the Nuremberg homeopathic table salt experiment aligns closely with these standards, demonstrating careful attention to randomization and blinding, overseen by independent supervisory bodies. Measurement procedures are precisely described, and results are reported accurately and neutrally. The primary methodological limitation identified is participant self-selection through voluntary enrollment.

Discussion: This document constitutes the earliest known report of a randomized, double-blind, controlled trial, conducted at a time when scientific methodology was still in its infancy. Making this text accessible through translation allows this pivotal moment in medical history to be reconsidered and contextualized, and provides valuable perspective on the subsequent body of research failing to demonstrate the clinical efficacy of homeopathy.

Conclusion: Homeopathy was subjected to rigorous evaluation as early as 1835 in a randomized, double-blind, controlled trial of remarkable methodological quality for its time, closely anticipating modern standards of clinical research. The findings demonstrate the absence of any specific effect of homeopathic dilutions, through a good level of scientific rigor.

Corresponding author: Marine Mercadié, marine.mercadie@u-bordeaux.fr

Healthof Luxembourg And Luxembourg Institute Of Health, Luxembourg, Luxembourg

Context: Health systems are increasingly strained by ageing populations and rising chronic disease. At the same time, older patients now purchase commercial smartwatches and present their data to their GPs, who often face these requests without clear guidance on how such metrics should be interpreted or used. Although smartwatches hold real potential for monitoring and self-management, their value in primary care for older adults remains uncertain, leaving clinicians to navigate growing patient expectations with limited evidence.

Objectives: 1) Synthesize findings about commercial Smartwatch applications in outpatient setting 2) Map the health outcomes associated with Smartwatch use in this population 3) Identify facilitators, barriers, and contextual factors that shape adoption and implementation of Smartwatches into clinical practice.

Methods: A scoping review was conducted following established guidelines. Comprehensive searches of PubMed, Embase, and CINAHL (2013–2024) identified over five thousand records, of which forty-four met inclusion criteria. Data were extracted on device types, health metrics, populations, study designs, clinical applications, outcomes, and barriers and facilitators. Title/abstract and full-text screening were performed independently and in a blinded manner by two reviewers, with duplicate data extraction to minimize bias. Disagreements were resolved by a third reviewer.

Results: Among 44 studies, cardiology led (14), then primary care (8) and pulmonology (7), with smaller numbers elsewhere. Sixteen smartwatch brands were used, mainly Fitbit (17) and Apple (11). Devices mostly captured steps/activity and heart rate or ECG, often combined. Applications spanned feasibility monitoring, correlation with clinical tests, active interventions for rehabilitation, chronic disease self-management and behavior change, and diagnostic AF screening. Barriers included comfort/usability, accuracy, interoperability, and low digital literacy; facilitators were motivating feedback, perceived value, and social support.

Discussion: Commercial smartwatches hold promise for enhancing outpatient care for older adults, but their success depends on inclusive design, meaningful integration into primary care, and strategies that address global health equity. Evidence for long-term impacts on morbidity, mortality, or implementation into healthcare utilization remained limited.

Conclusion: By mapping the understanding of current evidence of Smartwatch use in outpatient setting, this study lies the groundwork for a follow up qualitative study on the integration of Smartwatch use into primary care consultations.

Juliette CHAMBE, Antoine GIACOMINI, Marie-Elise SPEISSER, Joris TRAN, Burak TOK, Tristan MINGORI

Department Of General Practice, Strasbourg University, Strasbourg, France

Context: General practitioners play a central role in managing chronic insomnia, yet many patients experience long and complex therapeutic pathways. Light therapy is increasingly promoted as a non-pharmacological option. The INSOLUX randomized controlled trial assessed its efficacy in 239 primary care patients with insomnia, though its practical implementation in clinical settings remains to be clarified.

Objectives: This qualitative study was embedded within the INSOLUX trial. Its primary objective was to explore how patients with chronic insomnia experienced light therapy during their participation. A secondary aim was to identify factors influencing adherence, expectations, and perceived benefits.

Methods: Forty-two adults with chronic insomnia were interviewed after completing either active or placebo light therapy. Semi-structured interviews were conducted in person or by telephone, recorded and transcribed verbatim. An inductive thematic analysis was performed by multiple researchers, with regular meetings to reach consensus. The COREQ criteria guided the conduct and reporting of the study.

Results: Most participants were particularly motivated by the non-pharmacological aspect of the study, having previously tried several treatments. Light therapy was well tolerated and easily integrated into daily routines. Reported effects varied widely, independent of whether patients received active or placebo light therapy: some described easier sleep onset or fewer night awakenings, while others saw little change. Expectations, emotions, and personal beliefs played a key role in perceived effectiveness. Many participants felt improvement related to the study context itself—feeling listened to, increased attention to sleep habits, and dedicated time to discuss insomnia. Some wanted clearer information about their sleep disorder and wished for more personalized guidance.

Discussion: Only a subset of participants were interviewed, but sampling ensured maximal diversity of age, gender, and prior treatments. Patient accounts suggest that light therapy offers modest subjective benefits, yet is valued for being non-drug based. The interplay of emotions, expectation, and contextual factors underscores the complexity of evaluating treatments for chronic insomnia. The noted improvements also point to a Hawthorne effect. Overall, these results highlight the importance of individualized, holistic management for insomnia.

Conclusion: This study offers practitioners insights on using light therapy in patients with chronic insomnia, emphasizing both practical challenges and its integration alongside other recommended treatments.

ID 763- Patients' experiences with light therapy for chronic insomnia: a qualitative ancillary study of the Insolux trial

Esther METTING [(1)] , Solomon ALEM [(2)], Le NGUYEN [(1)], Maelle SPILLER [(1)]

(1) University Of Groningen, University Medical Center Groningen, Groningen, Pays-Bas
(2) Department Of Epidemiology And Biostatistics, Addis Continental Institute Of Public Health, Addis Ababa, Éthiopie

Context: Chronic obstructive pulmonary disease (COPD) increasingly burdens European healthcare systems due to aging populations and rising prevalence, causing significant morbidity, mortality, and economic costs. Digital health interventions (DHIs) can improve self-management and reduce hospitalizations. However, adoption among older adults remains limited.

Objectives: This study aims to identify distinct clusters of COPD patients based on their intention to use DHIs.

Methods: A cross-sectional survey of 232 adults with COPD (mean age 64.87 ± 11.39, 61.21% female) was conducted across seven European countries (July 2024–February 2025). Data included sociodemographic, UTAUT constructs, digital literacy, prior DHI experience, and intention to use DHIs. Cluster analysis using Gower's dissimilarity and Partitioning Around Medoids identified two clusters.

Results: Cluster 1 (n=104, "hesitant") exhibited lower education, limited computer use, and balanced intention distribution (38.5% positive, 40.4% neutral, 21.2% negative), with intention associated with social influence, performance expectancy, and digital literacy. Cluster 2 (n=128, "enthusiastic") featured higher education, prior positive DHI experience, and 83.6% positive intention, driven by lower effort expectancy, prior experience, and lower disease complexity. Significant cross-country variations were noted.

Discussion: Two distinct participant clusters emerged, reflecting different psychosocial and behavioral patterns toward digital health adoption. While cluster 1 showed a balanced-hesitant stance toward digital health, cluster 2 demonstrated strong enthusiasm and readiness to engage. Digital health adoption varies by psychosocial and skill profiles. Targeted literacy training and improved usability may enhance engagement.

Conclusion: Digital health adoption among patients with COPD and related chronic respiratory diseases is influenced more by psychosocial factors and digital skills than by demographic characteristics alone. Modifiable factors such as digital literacy, effort expectancy, performance expectancy, and social support can be leveraged to design targeted interventions for hesitant users. Although adoption patterns were broadly consistent across countries, subtle differences suggest that local context and healthcare system factors should be considered when implementing interventions, ensuring they are culturally and operationally appropriate. We highlighted the need for tailored strategies: interventions that build digital skills and social support for hesitant users, and usability-focused enhancements for motivated adopters. Applying cluster-informed approaches can improve engagement, promote equity, and maximize the effectiveness of digital health programs for older adults across diverse healthcare settings.

ID 336- Factors influencing appropriate vestibular care: an interview study with general practitioners and patients

Mina GUPTA [(1)] , Vipan SAI [(1)], Grace GIMSON [(2)], Tom RATCLIFFE [(1)], Nina JHITA [(1)]

(1) Modality Partnership, Nationwide, Royaume-Uni
(2) Holly Health, Nationwide, Royaume-Uni

Context: Primary care faces high demand from patients with long-term conditions, anxiety, insomnia, low mood and lifestyle-related concerns. These issues often require sustained support beyond routine clinical contacts. To address these issues we implemented a personalised digital self-management tool to support wellbeing, reduce avoidable appointments, and empower patient self-care.

Objectives: To evaluate the impact of digital self-management support on: 1. Wellbeing and self-efficacy 2. Lifestyle behaviours 3. Appointment utilisation 4. Suitability for patients with multimorbidity or mental health needs

Methods: The retrospective evaluation covered multiple primary care sites serving approximately 500,000 patients. Eligible patients included frequent attenders, individuals with multimorbidity, and those reporting low wellbeing. Uptake, wellbeing scores, behavioural indicators and appointment utilisation were monitored using real-world operational data. Patient feedback was analysed qualitatively.

Results: Among 25,000 invited patients, uptake was high across diverse demographic groups, including older adults and people with low digital confidence. Users reported substantial improvements in wellbeing: - 82% felt more in control of their health - 68% reported improved mental wellbeing - Significant improvement in ONS-4 wellbeing scores Behavioural outcomes included improved sleep, increased activity levels and sustained motivation. Users tracking health indicators reported a mean 4.7 kg weight reduction over eight weeks. Appointment utilisation decreased by 15% among the highest-need frequent attenders, releasing capacity for complex care and urgent demand. No additional clinical or administrative workload was generated. Patient feedback highlighted reduced anxiety, improved symptom management and enhanced confidence in self-care.

Discussion: A personalised digital self-management tool significantly improved wellbeing and supported behaviour change while reducing non-urgent appointment demand. Simplicity of access, personalised nudges and non-clinical guidance were key to equitable engagement. Importantly, the model required no additional clinical or administrative workload, enhancing its scalability.

Conclusion: Digital self-management tools can strengthen prevention, reduce pressure on primary care and improve patient outcomes when delivered with strong governance and behavioural design. This model demonstrates a scalable approach to strengthening primary care delivery and may inform international efforts to modernise primary care.

ID 2193- The Impact of Mindfulness-Based Therapies on Pain Severity in Office

Workers with Non-Specific Chronic Low Back Pain: A Randomised Controlled Trial

Merve Saniye IMANCER, Neslisah TAN, Vildan MEVSIM

Dokuz Eylul University Faculty Of Medicine, Department Of Family Medicine, Izmir, Türkiye

Context: Non-specific chronic low back pain is a common and multifactorial condition among office workers in primary care, and non-pharmacological approaches such as mindfulness-based therapies remain underexplored in this population.

Objectives: The primary objective of this study was to investigate the effects of mindfulness-based therapies on pain severity in office workers with non-specific chronic low back pain. We hypothesized that mindfulness-based interventions would reduce pain severity and improve psychological and functional outcomes compared to standard care.

Methods: This parallel-group, open-label, randomized controlled trial was conducted among employees of Dokuz Eylül University. A total of 104 office workers diagnosed with non-specific chronic low back pain were randomly assigned in a 1:1 ratio to either a mindfulness-based therapy intervention or a standard care control group. The intervention consisted of a structured mindfulness-based therapy program, while the control group received usual care. Pain severity, assessed using the Visual Analogue Scale (VAS), was defined as the primary outcome. Secondary outcomes included functional disability (Roland Morris Disability Questionnaire), physical activity levels (International Physical Activity Questionnaire), anxiety (Beck Anxiety Inventory), quality of life (SF-36 Health Survey), and mindfulness levels (Five Facet Mindfulness Questionnaire). Outcome measures were collected at baseline, immediately after the intervention, and at a 3-month follow-up.

Results: The intervention group showed a statistically significant reduction in pain severity compared to the control group (VAS, $p<0.05$), which was maintained immediately post-intervention and at the 3-month follow-up. Functional disability improved initially but was not sustained, while significant improvements were observed in anxiety, quality of life, and mindfulness levels in the intervention group.

Discussion: These findings suggest that mindfulness-based therapies may reduce pain severity in office workers with chronic low back pain, likely through psychological and cognitive mechanisms reflected by improvements in anxiety, quality of life, and mindfulness rather than sustained functional changes.

Conclusion: Mindfulness-based therapies may represent a promising non-pharmacological approach for the management of non-specific chronic low back pain, with beneficial effects on pain severity, anxiety, quality of life, and mindfulness. Their low-cost, feasible, and adaptable nature supports their potential integration into primary care and workplace-based health programs to enhance accessibility in chronic pain management.

ID 1715- Opioid use and quality of life after accidental injuries; a pragmatic randomised controlled trial

Gunhild NYTRØEN [(1)] , Lene Bergendal SOLBERG [(2)], Holgeir SKJEIE [(1)], Bård NATVIG [(1)], Jon Michael GRAN [(3)], Olav RØISE [(2)], Leiv Arne ROSSELAND [(4)], Trygve SKONNORD [(1)]

(1) Department Of General Practice, Institute Of Health And Society, University Of Oslo, Oslo, Norvège
(2) Division Of Orthopedic Surgery, Oslo University Hospital, Oslo, Norvège
(3) Department Of Biostatistics, University Of Oslo, Oslo, Norvège
(4) Department Of Research And Development, Division Of Emergencies And Critical Care, Oslo University Hospital, Oslo, Norvège

Context: Patients experiencing serious accidental injuries are at risk of developing long-term opioid use. Many are discharged without a clear opioid-management or follow-up plan. General practitioners (GPs) frequently report poor communication from hospitals about post-discharge opioid tapering and expected pain trajectories. These gaps in information and coordination may contribute to prolonged opioid prescribing.

Objectives: To evaluate whether a Pain and Coordination Plan (PAC-plan) for patients after accidental injury reduces opioid use and improves health-related quality of life (HRQoL), pain, and other patient-reported outcomes six weeks post-discharge.

Methods: This pragmatic unblinded randomised controlled trial enrolled 270 patients from the Division of Orthopaedic Surgery, XXX University Hospital, XXX between September 2023 and April 2025. The trial was prospectively registered on ClinicalTrials.gov (NCTXXX). Adults (≥18 years) undergoing acute orthopaedic surgery after accidental injury and discharged home with opioid medication, were eligible. Participants were assigned 1:1 to PAC-plan or usual care by randomising at the GP (cluster) level. The PAC-plan comprised (a) an opioid management plan at discharge, (b) a scheduled GP visit, with the consultation to occur within 2–4 weeks after discharge, and (c) facilitated GP–hospital collaboration. The primary outcome was self-reported oral morphine equivalent (OMEQ) consumption at six weeks post-discharge; secondary outcomes at six weeks included HRQoL, pain, sleep, mood and other patient-reported measures. The primary analysis will compare mean OMEQ at six weeks between groups using a linear mixed model with a random effect for GP (cluster) and adjustment for prespecified baseline covariates.

Results: Data collection is complete and statistical analyses are currently in progress. Final results will be presented at the conference.

Discussion: If proven effective, there is potential for the implementation of the PAC-plan in clinical practice, which could reduce problematic opioid use within society and improve patient-reported outcomes.

Conclusion: Final conclusions regarding the effectiveness of the PAC-plan will be presented at the conference. Keywords: Opioid Analgesics, Physical Trauma, Continuity of Care

ID 1507- Psychosocial skills and chronic pain: how are they associated? A systematic review.

Catherine LAPORTE

Departement Of General Practice, Umr 6602-Uca/cnrs, Clermont-Ferrand, France

Context: Chronic pain is a major global health issue and one of the leading causes of disability worldwide. Despite increasing recognition of its biopsychosocial nature, management in primary care remains challenging. Psychosocial skills (PSS) are defined by the World Health Organization as cognitive, emotional, and social capacities enabling adaptive and effective responses to life challenges. They may play a key role in how individuals perceive and manage pain. However, the relationship between PSS and chronic pain outcomes remains an insufficiently explored area.

Objectives: This systematic review aims to (i) examine associations between PSS and chronic pain outcomes, including pain intensity, disability, and quality of life; (ii) identify the most frequently studied skills; and (iii) describe the tools used to assess them.

Methods: Following PRISMA 2020 guidelines, a systematic search was conducted in PubMed, Embase, and PsycINFO for studies published between January 2015 and March 2025 from North America, Europe, or Australia. Eligible studies included original quantitative research on adults aged over 18 years old suffering from chronic non-cancer pain for more than 3 months.

Results: Of the 6,899 articles initially identified, 67 studies were included. The most frequently examined skills predominantly involved cognitive and emotional domains, particularly self-efficacy, coping, psychological flexibility, resilience, and self-esteem. Higher levels of these skills were consistently associated with reduced pain intensity, lower pain interference, and better quality of life. Coping emerged as a central psychosocial skill, encompassing cognitive, emotional, and social components essential to chronic pain adaptation. Social skills, which are less frequently studied, appeared to contribute to overall well-being and social participation.

Discussion: Despite heterogeneity, all studies converge in showing psychosocial skills modulate pain impact through emotional and cognitive pathways.

Conclusion: Psychosocial skills emerge as key determinants of disability, pain interference, and quality of life in chronic pain. These findings support a biopsychosocial perspective and highlight the importance, for general practitioners, of integrating psychosocial assessment and skills-based interventions such as cognitive-behavioral approaches into routine care. Strengthening these skills may offer a promising and sustainable approach to improving outcomes for individuals living with chronic pain.

ID 1457- Efficacy of Aspirin for Pain Management in Shoulder, Hip and Knee Osteoarthritis: A Systematic Review and Assessment Using the Rebuild the Evidence Base Method

Elodie CHARUEL [(1)] , Wafâa EL-HOUARI [(2)], Thibault MENINI [(1)], Hélène VAILLANT-ROUSSEL [(1)]

(1) Research Unit Acceppt Accompagnement Pluriprofessionnel Patient, Clermont-Ferrand, France
(2) General Practice Department Of Clermont Ferrand, Clermont-Ferrand, France

Context: Aspirin is the oldest analgesic treatment. Today, its use for pain relief has been largely supplanted by non-steroidal anti-inflammatory drugs (NSAIDs) in the management of osteoarthritis-related pain. Nevertheless, aspirin remains widely used, particularly for self-medication, facilitated by its over-the-counter availability. The benefit–risk balance of aspirin for this indication remains unclear.

Objectives: The primary objective of this study was to analyse the efficacy data of aspirin in the treatment of shoulder, hip, and knee osteoarthritis pain.

Methods: A systematic review of randomised controlled trials (RCTs) comparing aspirin with placebo or other NSAIDs was conducted in major databases (Cochrane, PubMed, Embase), following PRISMA criteria. The primary outcome was pain relief. Risk of bias was assessed using the ROB2 (Risk of Bias 2) tool. Level of evidence was graded using the REB (Rebuild the Evidence Base) method.

Results: Among 2,990 identified citations, eight studies met the inclusion criteria, all rated as having a high risk of bias. According to the REB method, there is an lack of evidence supporting the efficacy of aspirin for osteoarthritis pain. Five included studies reported that aspirin was significantly more effective than placebo. No statistically significant difference was observed between NSAIDs and aspirin, except for a single study reporting superiority of etodolac.

Discussion: This review's main strength lies in its comprehensive, librarian-assisted search strategy and its use of the REB method to focus on clinically relevant outcomes. However, the evidence base is outdated and of poor quality, consistent with recent literature.

Conclusion: Mainly due to the age of available trials, the overall quality of the evidence is insufficient to attribute a satisfactory level of evidence regarding the analgesic effect of aspirin in shoulder, hip, and knee osteoarthritis pain.

ID 1452- Assessment of Acute Low Back Pain in Primary Care

Inês Filipa DOMINGUES TEIXEIRA, Inês GOMES CASTRO, João Francisco POÇAS, João LEMOS, Ana Rita FERREIRA

Usf Cedofeita-Uls Santo António, Porto, Portugal

Context: Acute low back pain (LBP) is one of the most frequent reasons for consultation in primary care and a major contributor to disability worldwide. Although most episodes are non-specific and self-limiting, a small proportion may reflect serious underlying pathology. Early differentiation between benign and high-risk presentations relies on the clinical skills of the primary care physician. A structured approach, centred on focused history taking, thorough physical

examination, and systematic identification of red flags, is essential to ensure patient safety while avoiding unnecessary investigations.

Objectives: This review aimed to summarise best practices for assessing acute LBP in primary care, with emphasis on key components of the physical examination and the recognition of red flags that may indicate serious conditions. A secondary objective was to clarify which clinical findings should trigger imaging, additional investigation, or urgent referral.

Methods: A narrative literature review was undertaken using current evidence-based guidelines and major scientific sources on acute LBP in primary care. The synthesis focused on effective physical examination strategies, diagnostic accuracy of red-flag indicators, and established decision-making algorithms guiding investigation and referral.

Results: The evidence shows that routine imaging in acute LBP offers minimal clinical value and may lead to overdiagnosis. A comprehensive physical examination should include inspection, palpation, spinal mobility assessment, neurological testing of the lower limbs, straight-leg-raise testing, and gait evaluation. Red flags requiring urgent consideration include age >50 or <20 years, trauma, history of cancer, unexplained weight loss, immunosuppression, fever, intravenous drug use, night pain, progressive neurological deficit, saddle anaesthesia, and bowel or bladder dysfunction. These findings may indicate vertebral fracture, malignancy, infection, cauda equina syndrome, or significant neurological compromise, and warrant prompt investigation.

Discussion: A structured clinical assessment improves diagnostic accuracy and reduces unnecessary imaging. Red flags should not be interpreted in isolation; their combined presence increases the likelihood of serious disease and strengthens clinical decision-making.

Conclusion: Primary care clinicians should prioritise thorough physical examination and consistent screening for red flags in acute LBP. This approach enhances patient safety, reduces inappropriate investigations, and supports evidence-based management. Keywords (MeSH Terms): Low Back Pain; Primary Health Care; Physical Examination; Red Flags; Spine.

ID 1109- The Relationship between Treatment Methods and Depressive Mood in Patients with Low Back Pain

Şeyma CEYLAN, Ismail ARSLAN

Ankara Training And Research Hospital, Department Of Family Medicine, Ankara, Türkiye

Context: Low back pain is a common health problem that affects physical and psychological well-being. Understanding the relationship between depressive symptoms and treatment methods may help improve patient outcomes.

Objectives: This study aims to compare the pharmacological and nonpharmacological treatment methods used by patients presenting with low back pain and to investigate the relationship between depressive symptoms and the effectiveness of treatments.

Methods: This is a prospective, cross-sectional, and descriptive study. The study included 233 individuals aged 18-65 with low back pain who visited the Family Medicine or Traditional and Complementary Medicine (TCM) outpatient clinics at XXX Hospital. The researchers administered a questionnaire form containing sociodemographic characteristics, visual analog scale scores, and treatments applied for back pain to the patients through face-to-face interviews. The emotional state of the patients was evaluated with Beck depression inventory. The data collected throughout the research were analyzed using IBM SPSS 25.0 with a significance level set at $p<0.05$.

Results: A total of 233 individuals participated in the study, comprising 143 women (61.4%) and 90 men (38.6%), with a mean age of 46.16±13.99 years. For the treatment of low back pain, 45.1% (n=105) of patients reported receiving pharmacological treatment, 32.6% (n=76) reported receiving TCM treatment, and 21% (n=49) reported receiving physical therapy. 51.9% of the patients (n=121) had symptoms of depression. No significant association

was found between depression symptoms and TCM treatments (p=0,83), exercise (p=0,27), massage (p=0,56), heat application (p=0,78), balneotherapy (p=0,32), kinesiology tape (p=0,67), and physical therapy (p=0,10), while a significant difference was found with the use of pharmacological treatment in the last 3 months (p=0,006).

Discussion: In our study, the rate of depression among those using pharmacological treatment for low back pain was observed to be elevated, consistent with findings from recent studies. Therefore, depression should be considered in patients with excessive drug use related to back pain.

Conclusion: Assessing depressive symptoms in patients with low back pain may help clinicians develop more personalized and effective treatment strategies. It is recommended to screen for depression and initiate treatment if necessary, especially in patients experiencing severe low back pain and receiving drug therapy.

ID 286- effectiveness of systemic corticotherapy in back pain, with or without radiculopathy

François WELFERT

Departement Medecine Général, Lyon, France

Context: In France, back pain accounts for approximately 6 million consultations each year and represents a major public health issue due to the functional disability it causes. Systemic corticosteroids are frequently used in routine practice for the treatment of back pain. Their therapeutic impact has been evaluated by several clinical trials and meta-analyses, without demonstrating a clear benefit.

Objectives: Our work aims to perform a meta-analysis using recent literature and the latest bias assessment tools (RoB2) to evaluate the interest of systemic corticosteroids in back pain, with or without radiculopathy, according to the REB (Rebuild Evidence-Based Medicine) method.

Methods: A literature review was conducted to identify published trials up to 04/01/2024. The risk of bias in the trials was assessed using the RoB2 tool. The criteria for judgment include: reduction of pain in the short and medium term, disappearance of pain in the short and medium term, improvement in function, adverse effects, and use of analgesics. The overall level of evidence was graded according to the REB method.

Results: A total of 14 randomized clinical trials involving 1,099 patients were included. According to the REB method, our study concludes that there is a “lack of evidence” for all judgment criteria, except for the improvement in function, which shows a “signal.”

Discussion: This study shows a lack of solid evidence for the effectiveness of systemic corticosteroids in back pain or radiculalgia for almost all evaluated judgment criteria.

Conclusion: The “signal” regarding functional improvement does not constitute sufficient justification for routine use but may encourage further research.

(6) Faculty Of Medicine, University Of Coimbra, Portugal Coimbra Institute For Clinical And Biomedical Research, Portugal, Coimbra, Portugal

Context: Adolescence is a period of significant physical, psychological, and social changes, which can be intensified by the diagnosis of serious or chronic illnesses. This makes promoting autonomy in palliative care particularly challenging.

Objectives: The present review aimed to identify factors and strategies that promote the autonomy of adolescents in palliative care.

Methods: We conducted a systematic review following Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines, searching PubMed, Web of Science, and Scopus. This systematic review synthesized existing literature and evidence regarding communication, involvement, and psychosocial support strategies in adolescent palliative care. The study examined various tools and models, including Voicing My Choices, Building Our Solutions Together for Pediatric Advance Care Planning (BOOST-pACP), and the Family-Centered Advance Care Planning (FACE) model, to evaluate their effectiveness in facilitating communication, family support, and decision-making.

Results: Six studies were included. Adolescent autonomy in palliative care is affected by social, emotional, and clinical factors and varies throughout the disease course. Open communication, psychosocial support, and active involvement in decision-making are linked to increased autonomy and well-being. Family-centered advance care planning models and structured tools improve communication and alignment between adolescents' and families' preferences, although family dynamics and disease progression can still limit autonomy

Discussion: Effective communication tools and family-centered approaches are crucial for promoting adolescent autonomy. Strategies focused on open communication, psychosocial support, and active adolescent involvement in decisions can enhance autonomy, although further research is needed to assess their effectiveness.

Conclusion: Implementing communication facilitation, psychosocial support, and adolescent involvement strategies is essential. Despite the need for more evidence, the review offers a set of recommendations to support the autonomy of adolescents in palliative care.

ID 1494- Long-term Qualitative Evaluation of Simulation-Based End-of-Life Communication Training for Primary Care Teams

Tali SAHAR [(1)] , Adi FINKELSTEIN [(2)], Meir BREZIS [(3)], Ruth KANNAI [(3)], Ohad AVNI [(3)], Yisrael KATZ [(3)]

(1) Hebre University Of Jerusalem, Jerusalem, Israël
(2) Jerusalem College Of Technology, Jerusalem, Israël
(3) Hebrew University Of Jerusalem, Jerusalem, Israël

Context: Primary-care teams are central to providing end-of-life (EoL) care in the community, yet many clinicians feel underprepared for complex EoL conversations. Simulation-based training with professional actors may enhance communication skills, but evidence on long-term impact in community-based interdisciplinary teams is limited.

Methods: We adapted a hospital-based EoL communication workshop to primary care using literature and stakeholder input. Eight clinics (8 interdisciplinary teams; 42 participants) attended a one-day workshop combining actor-led simulations, feedback and group discussions. Pre/post questionnaires, debriefs and 6- and 30-month interviews/focus groups were thematically analysed.

Originality: Interdisciplinary primary-care team participants

Lessons learned and future implication: Simulation with actors legitimised talking openly about death and dying. However, A single workshop can catalyse change but is not enough on its own; continuity and follow-up spaces are needed.

Discussion: Despite being a single-day intervention, the workshop appeared to shift how participants viewed and approached EoL conversations, increasing legitimacy and confidence while also surfacing feelings of isolation around EoL care. These findings support the idea that carefully designed, simulation-based training can influence both communication behaviour and the emotional climate around palliative care in the community. At the same time, the strong call for continuity suggests that workshops should be embedded within broader organisational support for primary-care palliative care.

Conclusion: Simulation-based EoL communication training for interdisciplinary primary-care teams is feasible, acceptable and perceived as helpful in legitimising and improving difficult conversations. When paired with ongoing reflective spaces, it may strengthen person-centred palliative care in the community

ID 1356- From legal concept to clinical meaning: how do general practitioners interpret "unreasonable obstinacy

Margaux LAVOILLOTTE

Faculté De Médecine Rennes 1, Rennes, France

Context: Introduction: The Léonetti Law of April 22, 2005 defines unreasonable obstinacy as any treatment that is useless, disproportionate, or has no other effect than the artificial maintenance of life. Its qualification, left to the physician's judgment, allows for wide interpretation. At the same time, 80% of patients express the wish to die at home, where the general practitioner plays a central role in care. Decisions to discontinue treatment, both frequent and complex, represent a major challenge. This study explores how general practitioners interpret unreasonable obstinacy and how they integrate it into their practice.

Objectives: To collect and compare general practitioners' definitions with that set out in law, to analyze the distinction with the term "therapeutic obstinacy," and to understand its clinical application as well as the factors influencing it.

Methods: Qualitative study based on semi-structured interviews with general practitioners in private practice. Sampling was purposive, taking into account experience, practice setting, and palliative care training. Analysis was inspired by interpretative phenomenological analysis.

Results: Participants' personal definitions were heterogeneous yet coherent, centered on the meaning of life, dignity, and the patient's wishes, within a dynamic approach. The legal definition was little known and reflected an ambivalent relationship to the law, perceived more as a symbolic framework than a decision-making tool. Interpretation resulted from the interaction between the physician—through both professional stance and personal background—the patient, family members, and the broader healthcare system.

Discussion: The qualification of unreasonable obstinacy is evolving and cannot be confined to a fixed norm. Doubt permeates decision-making, and the guiding intention is decisive. Collegial deliberation and communication emerge as essential tools. The law, though broad in scope, provides protection when respected.

Conclusion: Doubt runs through the entire process, and the physician's intention plays a key role. The law provides a general framework that legitimizes and protects uncertain decisions. The physician's position evolves with experience and professional role, while the patient and family express their expectations and fears. Legal constraints and pressures within the healthcare system also influence decisions. Interpreting unreasonable obstinacy emerges from a shared reflection seeking balance between life, dignity, and individual freedom.

(2) Palliative Nexus Research Group, Department Of Medicine, University Of Melbourne, Melbourne, Australia, Melbourne, Australie
(3) Department Iq Health, Radboud University Medical Centre, Nijmegen, The Netherlands, Nijmegen, Pays-Bas
(4) Leidsche Rijn Julius Healthcare Centres, Utrecht, The Netherlands, Utrecht, Pays-Bas
(5) Department Of Medical Oncology, Erasmus Medical Centre Cancer Institute, Rotterdam, The Netherlands, Rotterdam, Pays-Bas

Context: Palliative care patients frequently use potentially inappropriate medications (PIMs), leading to negative health outcomes. Deprescribing remains poorly enacted in primary care. In the [XX] project, structured medication reviews were implemented in general practice clinics aimed at improving appropriate prescribing.

Objectives: To explore the experiences of palliative care patients, their relatives and primary healthcare practitioners (HCPs) regarding participation and engagement in medication reviews in general practice, and to understand their perceived impacts.

Methods: Semi-structured interviews were conducted underpinned by a hermeneutic phenomenological approach. Participants were purposively recruited from five [XX] general practices and comprised community-dwelling older patients (^{3}65 years) with advanced disease and a life expectancy <1 year who received a medication review within the [XX] project, their relatives, and primary HCPs. Data were analysed using inductive thematic analysis.

Results: Eight participants have been interviewed to date (1 pharmacist, 3 general practitioners (GPs), 2 patients, and 2 relatives), with interviews expected to be completed by February 2026. Four themes characterised participants' experiences: (1) Value and timing: conversations were perceived as valuable, occasionally linked to improvements in physical symptoms, yet outcome and perceived benefit varied according to palliative stage and was constrained by prognostic uncertainty; (2) Affective reluctance: perceptions towards (de)prescribing were shaped by prior experiences, emotional concerns, or limited knowledge, prompting patient and HCP caution; (3) Shared decision-making: decision-making was collaborative and case-specific, often led by patient wishes. Sufficient time, clear explanations, and involvement of relatives enabled meaningful discussions; (4) Interprofessional collaboration: trusted, low-threshold collaboration between the executing HCP and GP was regarded beneficial, supported by clear considerations and minimal additional GP workload.

Conclusion: Medication reviews in community primary palliative care were viewed as valuable and may enhance appropriate prescribing and person-centred care. Reluctance to deprescribing appeared to arise from prognostic uncertainty and negative perceptions, alongside a desire to avoid harm, which led to HCPs acceding to patient wishes. Acceptance may be improved through person-centred dialogue, trusted interprofessional collaboration, and attention to emotional concerns and gaps in knowledge and communication skills. Future research should focus on reducing prognostic uncertainty and integrating implementation science to improve sustainable deprescribing, appropriate medication use, and quality of life.

ID 450- Quality Improvement Project in a North East London GP Practice: Proactive Identification of Palliative Patients Using the Gold Standards Framework (GSF)

Ho Tsun Ivy NG [(1)] , Ahmad ZIA [(1)], Hema GIRIDHAR [(2)]

(1) Imperial College School Of Medicine, London, Royaume-Uni
(2) Ilford Medical Centre, London, Royaume-Uni

Context: An ageing population and rising multimorbidity are increasing demand for palliative and end-of-life care. Despite its proven benefits in improving quality of life, over 100,000 people in the UK die each year without adequate palliative care. This Quality Improvement Project (QIP) was conducted in an east London practice with a predominantly ethnic minority population, where barriers and facilitators to accessing care vary. Early identification of palliative needs is therefore essential. Use of the Gold Standards Framework (GSF) has been shown to achieve identification of 75-90% of palliative care patients on GP registers (GSF Centre in End of Life, 2016).

Objectives: To investigate whether application of the GSF improves identification of patients with palliative care needs.

Methods: This QIP focused on patients with heart failure and dementia selected from the Quality and Outcomes Framework (QOF) registers. Records were reviewed using the GSF Proactive Identification Guidance (PIG, 7th Edition, 2022), applying the "surprise question" ("Would you be surprised if the patient were to die in next year, months, weeks or days?") alongside general and disease-specific indicators of decline.

Results: The initial palliative care register included 26 patients. Of 166 records reviewed, (heart failure 130; dementia 36),13 were excluded (duplicates 6, death 1, already registered 6). Of 153 remaining, the surprise question identified 12; GSF criteria applied to the rest identified 16 more as potentially suitable for palliative care (28 in total).

Discussion: Applying GSF criteria to chronic disease registers can identify patients who may benefit from palliative care, and extending GSF to other disease-specific indicators may identify more suitable patients. Earlier recognition supports proactive advance care planning, reduces crisis admissions, and enables personalised, patient-centred care. The next step is to invite identified patients for discussion to assess needs and suitability for advance care planning. Subsequent follow-up would enable assessment of feasibility, acceptability, and impact, providing a stronger basis for evaluating whether wider implementation of the GSF tool is justified.

Conclusion: The GSF PIG tool shows promise as a proactive, systematic method for identifying palliative care needs in primary care, with further evaluation required to determine its feasibility and value for wider implementation.

ID 487- Incidences of antithrombotic therapy discontinuation, bleeding and thromboembolic events in patients with cancer during their last phase of life: insights from primary care consultations records

Carline VAN DEN DRIES [(1)] , Denise ABBEL [(2)], Emmy TRINKS-ROERDINK [(1)], Suzanne CANNEGIETER [(2)], Jacobijn GUSSEKLOO [(2)], Erik KLOK [(2)], Simon MOOIJAART [(2)], Simon NOBLE [(3)], Stella TROMPET [(2)], Geert-Jan GEERSING [(1)]

(1) Julius Center Umc Utrecht, Utrecht, Pays-Bas
(2) Leiden University Medical Center, Leiden, Pays-Bas
(3) Cardiff University School Of Medicine, Cardiff, Royaume-Uni

Context: Given the lack of high-quality studies, it remains uncertain whether patients with cancer still benefit from antithrombotic therapy (ATT) in their last phase of life.

Objectives: We aimed to estimate incidences of ATT discontinuation, bleeding, venous thromboembolic (VTE), and arterial thromboembolic events (ATE) in patients with cancer during their last phase of life.

Methods: We included patients ≥18 years with cancer at first reimbursement claim for general practitioner (GP) palliative care between 2018 and 2022 in the Netherlands. From this first claim onwards, we manually identified outcomes in free-text reports of routine primary care consultations. Patients were followed until death or loss to follow-up.

Results: Among 2860 included patients, 32.5% used ATT at the index date. The median age was 77 years (IQR 70-84) for ATT users and 73 years (IQR 64-82) for non-users. The median follow-up was 43

days (IQR 14-190) for ATT users and 42 days (IQR 13-149) for non-users. During follow-up, 22.6% of ATT users discontinued ATT, with a median of 8 (IQR 3-28) days before death. Bleeding occurred in 28.5% of ATT users and 22.0% of non-users. VTE occurred in 3.1% of ATT users and 3.0% of non-users and ATE in 2.5% of ATT users and 1.9% non-users.

Discussion: We manually coded all outcome events from free-text GP consultation reports, in contrast to most other studies in this field that rely on diagnosis codes and/or hospital data while end-of-life patients are often no longer referred to the hospital. Although we still had to rely on what GPs wrote down in the medical file, this approach created a very unique and rich dataset.

Conclusion: One third of patients used ATT, and the minority discontinued treatment, usually shortly before death. We found high bleeding incidences in patients with cancer during the last weeks of life, especially among ATT users. Bleeding events largely outnumbered thromboembolic events, showing that the burden of "minor" bleeding events, including hematomas and urogenital bleedings, should not be underestimated. These findings provide new insights into ATT management and inform future research on optimizing ATT use in patients with cancer during their last phase of life.

ID 220- Providing early interventions for end-of-life patients through monitoring unplanned admissions

Navin Kumar GHOSH, Georgina DUNKINSON

None, Norwich, Royaume-Uni

Context: Many patients receiving palliative care experience emergency admissions at the end of life (Pring et al., 2024; Mason et al., 2016). We started an initiative at our rural GP practice to identify patients requiring palliative care who present as unplanned admissions to A&E.

Objectives: We hypothesised that this would effectively identify these patients given the high rates of admission at the end of life. We aimed to facilitate early intervention by being aware of A&E admissions as opposed to hospital discharges.

Methods: We systematically searched SystmOne twice weekly to capture all patients presenting to A&E. The data was reviewed each week and notes reviews were conducted, identifying patients with new or existing cancer diagnoses. We assessed palliative care needs and discussed these patients in our monthly multidisciplinary Gold Standard Framework meetings. In September 2025, we conducted a retrospective notes review of palliative patients identified through their unplanned admission between January and July 2025 and assessed how this had affected their end-of-life care.

Results: 43 out of 218 A&E attendances (20%) related to 12 patients with a known or new palliative diagnosis. Of these 12 patients, 5 (42%) required further input from the surgery including end-of-life charts and replacing RESPECT forms lost during their A&E visits. 4 (33%) patients died in hospital or within 48 hours of discharge. 3 (25%) patients had hospital-initiated palliative care and we remained aware of their progress without needing to intervene.

Discussion: Monitoring our unplanned admissions ensures we are aware of our end-of-life patients. In 42% of cases we find that we need to intervene, allowing us to be proactive with care we provide to patients and their families. Acting quickly is essential, as illustrated by our patients who passed away very soon after discharge.

Conclusion: Monitoring unplanned admissions helps us to identify our end-of-life patients early and provide timely interventions. References: Pring, A., Westwood, J., Bowtell, N. and Verne, J. (2024). 51 Emergency hospital admissions near the end of life. [online] doi:https://doi.org/10.1136/spcare-2024-mcr.47. Mason, E., Jenkins, D., Williams, M. and Davies, J. (2016). Unscheduled care admissions at end-of-life – what are the patient characteristics? Acute Medicine Journal, 15(2), pp.68–72. doi:https://doi.org/10.52964/amja.0609.

Patient-centered care

ID 2103- The Turkish Validity and Reliability Study of the Chronic Conditions

Physician–Patient Relationship Scale in Family Medicine Practice

Duygu AYHAN BASER [1] , Ogulcan ÇÖME [2], Emre SARI [3], Nezaket SABIR [2]

(1) Hacettepe University Faculty Of Medicine, Ankara, Türkiye
(2) Dokuz Eylül University Medical Faculty, İzmir, Türkiye
(3) Edirne Merkez Yancıkçı Şahin Aile Sağlığı Merkezi, Edirne, Türkiye

Context: Strong physician–patient relationships are essential for effective chronic disease management in family medicine. However, the lack of a validated Turkish instrument limits the evaluation of these relationships from the patient's perspective in primary care. Adapting the Chronic Conditions Physician–Patient Relationship Scale (CC-PPR) into Turkish is therefore necessary to support patient-centered care, assess communication quality, and strengthen research and quality improvement efforts in family medicine practice.

Objectives: This study aimed to adapt the Chronic Conditions Physician–Patient Relationship Scale (CC-PPR) into Turkish and to examine its validity and reliability among patients with chronic diseases receiving care from family physicians.

Methods: A methodological study was conducted with 254 adult patients attending the Family Medicine Centers between May 01, 2025, and October 01, 2025. The adaptation process followed World Health Organization guidelines. Construct validity was examined using confirmatory factor analysis (CFA), and reliability was assessed through internal consistency (Cronbach's α, McDonald's ω) and item–total correlations. Group comparisons were performed across sociodemographic and healthcare-related variables.

Results: The CFA supported the original one-factor, 22-item structure with an excellent model fit ($\chi^2[209] = 59.847$, $p = 1.000$; CFI = 1.000; TLI = 1.016; RMSEA = 0.000; SRMR = 0.048). Sampling adequacy was superb (KMO = 0.970; Bartlett's $\chi^2[231] = 5934.429$, $p < 0.001$). All standardized factor loadings were high (0.63–0.81, $p < 0.001$). Internal consistency was excellent (Cronbach's α = 0.977; McDonald's ω = 0.976), and corrected item–total correlations ranged from 0.74 to 0.86. Marital status, employment status, and type of health institution were significantly associated with relationship scores ($p < 0.05$).

Discussion: It can be used to assess communication and relational competencies of family physicians, support patient-centered care initiatives, and guide interventions aimed at improving continuity and satisfaction in chronic disease management.

Conclusion: The Turkish version of the CC-PPR can be used to assess communication and relational competencies of family physicians, support patient-centered care initiatives, and guide interventions aimed at improving continuity and satisfaction in chronic disease management.

ID 1605- The Consequences of Announcing a Cancer Diagnosis for the Doctor-patient Relationship. A Qualitative Survey Among Adult Patients in Remission

Anne PLESSIS, Joanna LEBRUN

Dmg, Angers, France

Context: Delivering bad news to a patient is difficult for any doctor. A patient's reception of such news generally evolves over time and is influenced by various factors.

Objectives: The main objective of this study is to describe the consequences of announcing a cancer diagnosis for the doctor-patient relationship, from the patient's perspective

Methods: This is a qualitative study based on semi-structured individual interviews conducted with adult patients suffering from cancer that has stabilized or is in remission. Verbatim extracts from the interviews were analyzed using inductive thematic analysis.

Results: Fifteen patients were interviewed between April 2024 and January 2025. The study's findings indicate that the doctor-patient

relationship is a continuum in the patient's life and is built up over the course of life events, including cancer. Cancer has varying consequences on the doctor-patient relationship, whether positive or negative. This unique relationship is put to the test by the expectations, demands and emotions of the cancer patient, who the doctor must accomodate.

Discussion: The announcement of a cancer diagnosis is difficult for the patient but constitutes only one moment within a continuum of announcements. During the oncological journey, the specialist acts as the technical advisor, while the general practitioner acts as a more humain point of contact. He or she is available, depending on the patient's needs, to support them, coordinate their care and monitor their case remotely. Finally, cancer can lead patients to change their lifestyle and pay more attention to their health.For the patient, there is a “before” and an “after” the announcement of a cancer diagnosis, but also for the doctor-patient relationship. This relationship evolves throughout the patient's life, with cancer being a defining moment. However, the patient can count on the general practitioner who was, is and will be there after their cancer diagnosis.

Conclusion: For the patient, there is a “before” and an “after” the announcement of a cancer diagnosis, but also for the doctor-patient relationship. This relationship evolves throughout the patient's life, with cancer being a defining moment. However, the patient can count on the general practitioner who was, is and will be there after their cancer diagnosis.

ID 1487- Exploring the feasibility of implementing shared decision making in Korean primary care: A policy proposal

Jihyun YOON [1] , Seungmin NAM [2]

(1) Korea University Anam Hospital, Seoul, Corée, République de
(2) Kyoto University, Kyoto, Japon

Context: Shared Decision Making (SDM) is a cornerstone of patient-centered care. While established globally, SDM implementation in Korean primary care is hindered by a volume-based reimbursement system and short consultation times

Objectives: To analyze barriers to SDM in the Korean clinical context and propose practical strategies for its establishment, focusing on the pivotal role of family medicine specialists.

Methods: We conducted a comparative analysis of SDM policies and clinical models in the US, UK, Germany, and Canada. We evaluated these against the Korean primary care environment, specifically examining legal frameworks, reimbursement systems, and the continuity of care provided by family medicine specialists.

Results: Key barriers identified include the lack of financial incentives and standardized decision aids. We propose three strategic pillars: 1) Clinical Tools: Adopting the "Three Talk Model" and developing standardized Patient Decision Aids (PDAs). 2) Policy Reform: Introducing a specific "SDM Counseling Fee" within the National Health Insurance to compensate for extended consultations. 3) Education: Mandating SDM training in family medicine residency and continuing medical education (CME).

Discussion: Family medicine specialists are uniquely positioned to lead SDM due to their comprehensive and continuous patient relationships. However, sustainable implementation requires shifting from individual effort to structural support through policy and reimbursement reforms.

Conclusion: Establishing SDM in Korea requires a multi-faceted approach involving tool development, policy reform, and education. These strategies will enhance patient autonomy and align Korean primary care with global standards of humanistic medicine.

ID 490- Understanding barriers to implement shared decision making in cystitis treatment with women with limited health literacy: a qualitative study

Alma VAN DE POL [1] , Thomas SOPHIE [2], Lisa POWAGA [2], Rosaline MENTINK [3], Tina MANTEL [3], Roderick VENEKAMP [2], Tamara PLATTEEL [2], Sibyl ANTHIERENS [4], Dorien ZWART [2], Leo VAN ROSSUM [1]

(1) Nhg, Utrecht, Pays-Bas
(2) Umcu, Utrecht, Pays-Bas
(3) Pharos, Utrecht, Pays-Bas
(4) Universiteit Antwerpen, Antwerpen, Belgique

Context: Our national urinary tract infection guideline recommends shared decision making (SDM) for otherwise healthy, non-pregnant women presenting with cystitis. Three options should be discussed: immediate antibiotics, delayed antibiotic prescribing, or 'watchful waiting'. In practice, this guideline recommendation is rarely implemented. GP practice staff report particular challenges when applying SDM in women with limited health literacy (LHL).

Objectives: As SDM improves patient involvement, understanding, and personalized care, we aim to explore factors influencing SDM implementation for women with and without LHL presenting with suspected cystitis in general practice.

Methods: We conducted a qualitative study with three focus groups, two with GP practice staff and one with women with LHL and difficulty with reading and writing. Topic lists were based on the Consolidated Framework for Implementation Research (CFIR). Transcripts were analysed using reflective thematic and framework analysis.

Results: Preliminary analyses indicate that GPs and GP assistants often conceptualized SDM as achieving patient agreement to avoid antibiotics rather than facilitating informed choice. Women with LHL described needing clearer explanations of cystitis and treatment options. While all groups valued the patient-healthcare provider relationship, trust between GP assistants and women with LHL appeared fragile. Key barriers included organisational constraints, lack of accessible patient information, safety concerns, and anticipated patient expectations for antibiotics.

Discussion: These findings inform development of an implementation strategy, co-created with GPs, GP assistants and women with and without LHL to enhance SDM for all women presenting with suspected cystitis.

Conclusion: Meaningful SDM implementation requires reframing it as facilitating informed choice rather than achieving treatment outcomes, strengthening trust with women with LHL, and creating accessible information within workable practice structures.

ID 1060- Enhancing Understanding of Interventions to Increase Relational Continuity in Primary Care: A Realist Review of Context, Mechanisms, and Outcomes

Serge ENGAMBA

Exeter University, Exeter, Royaume-Uni

Context: Relational continuity of care (RCC), which is characterised by an ongoing therapeutic relationship between patients and their primary care providers, is critical for ensuring high-quality care in general practice. Despite its importance, challenges such as staffing shortages, policy shifts, and evolving patient needs often impede its consistent delivery (1, 2). A number of strategies have been implemented to improve relational continuity, but there is a limited understanding of how these strategies work, for whom, and in which contexts they are most effective (3)

Objectives: This realist review aims to investigate how, why, and under what circumstances relational continuity of care (RCC) is achieved in general practice, and to explore the outcomes it produces for patients, healthcare providers and the wider healthcare system.

Methods: A realist review is a theory-driven method of evidence synthesis that incorporates qualitative, quantitative, mixed-methods research, and grey literature. This review will focus on the UK and countries with similar primary care systems, featuring multidisciplinary teams, general practice leadership, group practices, and autonomy over practice organization with defined patient lists. It

will use Pawson's five steps for realist reviews to examine the contexts, mechanisms, and outcomes (CMOs) of delivering RCC in general practice: (1) identifying theories, (2) gathering evidence, (3) selecting articles, (4) extracting data, and (5) synthesizing findings. The review will adhere to RAMESES quality standards for realist synthesis.

Results: We will present the final programme theory and results of literature searches as well as stakeholder consensus, which is still underway but will be completed by the spring on 2026..

Discussion: Ultimately, the review will conclude with recommendations for practice and policy, offering actionable insights on how to design, implement, and adapt RCC interventions to improve relational continuity in general practice. The refined programme theory will guide these recommendations, and it will be shared with healthcare practitioners, policymakers, and researchers to enhance the sustainability and effectiveness of RCC interventions in primary care.

Conclusion: The findings will provide data to inform future research and refine strategies and policies that support the effective delivery of relational continuity, which in turn may lead to improved patient outcomes and enhanced care experiences.

ID 545- Bridging Law and Humanity: The Role of Family Physicians in Implementing the Patient Right to Autonomy Act in a Family-Centered Culture

Ju Chien JENG, Po Tsung HUANG

Department Of Community And Family Medicine, China Medical University Hospital, Taichung City, Taïwan, République de Chine

Context: Taiwan has entered a super-aged society with growing needs for end-of-life and chronic care. Although Taiwan ranks among the highest worldwide in hospice quality, cultural barriers remain. In a family-centered society shaped by Confucian values, older patients often avoid discussing death, and families may resist advance decisions (AD) or advance care planning (ACP), fearing it signals abandonment. Some patients misunderstand the Patient Right to Autonomy Act (PRAA), believing an AD means refusing all life-sustaining treatment. These encounters highlight the gap between legal protection and cultural perception in primary care.

Methods: This reflection is based on ACP discussions introduced during chronic disease management. Family physicians used familiar language, simple metaphors, and real-life examples to explain the PRAA and correct misconceptions. Instead of starting with documents, physicians first built trust and gradually shifted from disease-focused conversations to discussions about values, goals, and preferences for future care. Longitudinal relationships made these conversations more open and meaningful. Physicians also strengthened their legal literacy through workshops and self-study to better guide patients and families.

Originality: Despite Taiwan's leadership in hospice and palliative care, few reports describe how family physicians apply the PRAA within a collectivist culture. This reflection shows how primary care connects legal principles with culturally sensitive, relationship-b

Lessons learned and future implication: Legal rights alone cannot ensure meaningful ACP conversations. Trust, continuity, and culturally respectful dialogue are essential. Earlier ACP integration, enhanced clinician training on the PRAA, and community education may help families make value-base

Discussion: Promoting autonomy in East Asian contexts requires empathy, patience, and cultural awareness. Family physicians, who accompany patients across life stages, are well positioned to balance family values with individual wishes. These encounters reveal tension between filial expectations and self-determination. When grounded in patient-centered dialogue, ACP becomes not a refusal of care but a shared process of understanding within families.

Conclusion: Integrating ethical reflection, cultural sensitivity, and legal knowledge into family medicine strengthens decision-making and humanistic care. By bridging law and humanity, family physicians help

patients and families navigate choices with dignity and mutual respect.

ID 2181- The Relationship Between Self-Care Management and Treatment Adherence in Individuals Diagnosed with Type 2 Diabetes Applying to Family Medicine Outpatient Clinics

Nil TEKIN [(1)] , Halenur YILMAZ PAVIK [(2)]

(1) University Of Health Sciences Izmir Faculty Of Medicine, Department Of Family Medicine, Tepecik Training And Research Hospital, Izmir, Türkiye
(2) University Of Health Sciences Tepecik Training And Research Hospital, Izmir, Türkiye

Context: To prevent complications of diabetes and maintain optimal health, it is essential to enhance patients' knowledge about diabetes, ensure their active participation in treatment, and promote effective self-care management.

Objectives: This study aimed to examine the relationship between self-care management and treatment adherence in individuals diagnosed with Type 2 Diabetes Mellitus (T2DM) who visited the Family Medicine outpatient clinics of XXX Hospital.

Methods: This cross-sectional study was conducted between February 17, 2025, and May 20, 2025. A total of 201 patients diagnosed with T2DM participated. Self-care management was assessed using the "Chronic Disease Self-Management Scale," and treatment adherence was measured with the "Medication Adherence Reporting Scale."

Results: Of the participants, 52.2% were women, with a mean age of 58.08±12.39 years. Comorbid chronic conditions were identified in 60% of participants, and diabetes-related complications were found in 13.4%, with retinopathy being the most common. Participants who regularly attended check-ups, engaged in physical activity, and adopted dietary changes showed higher self-care and medication adherence scores. A strong positive correlation was found between self-protection behaviors and treatment adherence. Those who received diabetes education had significantly higher scores in both scales. However, no significant difference was observed in social protection levels in certain comparisons.

Discussion: Higher levels of self-care management were associated with better treatment adherence. These findings emphasize the vital importance of structured diabetes education and supportive care practices in improving treatment adherence and health outcomes among individuals with diabetes.

Conclusion: Strengthening self-care abilities and promoting lifestyle changes should be prioritized in diabetes care to achieve better clinical results.

ID 1472- Today's topic... diabetes – an experience report

Sofia BENTO, Joana SOUSA GOUVEIA, Rita LEANDRO, Mónica FONSECA, Filomena BENTO, Marta CALADO, Susana ESTEVES

Unidade De Saúde Familiar Areeiro, Unidade Local De Saúde De São José, Lisboa, Portugal

Context: Diabetes is a leading cause of morbimortality worldwide, with substantial socioeconomical impact. Health literacy supports informed decisions, appropriate behaviours, and effective self-management. Evidence shows that interventions designed to strengthen health literacy can improve disease-related knowledge and promote healthier practices.

Methods: This pilot project aimed to enhance diabetes-related literacy, encourage healthier behaviours, and reinforce patients, caregivers, and primary care team connections. It targeted adults with any type of diabetes and their caregivers followed at the Areeiro Family Health Unit. Conducted between 19th September and 17th October 2025, it consisted of five weekly sessions, one introductory and four structured and educational sessions. These covered basic concepts of diabetes pathophysiology, complications, and

management principles; nutrition guidance; diabetic foot care; and the role of physical activity, concluding with an outdoor educational walk. Strengths included multidisciplinary involvement, small-group dynamics, and high participant engagement. A limitation was the absence of formal outcome measurement, preventing objective evaluation of effectiveness.

Originality: This was the first community-based diabetes literacy intervention implemented in our health unit. While previous studies show benefits of literacy-based education in improving diabetes knowledge and self-management, this project distinguishes itself by be

Lessons learned and future implication: Engagement was strong and sustained, with positive feedback throughout. The small-group format and interaction with the healthcare team appeared to strengthen motivation and adherence. It emphasised the importance of tailoring content to community needs.

Discussion: This project proved feasible and well-received, highlighting the value of primary care-based, interactive education. Even though there was no formal evaluation of outcomes, participants described the sessions as informative, reported increased motivation to implement healthier lifestyle measures, and appreciated the connections created between themselves and the health professionals. Multidisciplinary collaboration and proximity of care may strengthen long-term self-management and adherence.

Conclusion: This intervention highlights the value of structured, community-oriented health-literacy programmes within primary care suggesting meaningful benefits for patient empowerment, therapeutic relationships and adherence. Expanding similar initiatives could contribute to better chronic disease control and populational health.

ID 1444- Management and Treatment of Diabetes Mellitus at End of Life

Inês Filipa DOMINGUES TEIXEIRA, Inês GOMES CASTRO, João Francisco POÇAS, João LEMOS, Helena CABRAL

Usf Cedofeita-Uls Santo António, Porto, Portugal

Context: Diabetes mellitus (DM) is a prevalent chronic condition, affecting 13.3% of the Portuguese population aged 20 to 79 years. In end-of-life care, the goals of diabetes management differ substantially from those applied in earlier disease stages. The clinical emphasis shifts away from strict glycaemic control towards prioritising patient comfort, minimising treatment burden, and preventing acute metabolic complications such as hypoglycaemia and dehydration. Conventional long-term markers, including glycated haemoglobin (HbA1c), become less clinically relevant as therapeutic decisions rely mainly on short-term symptom control and patient-centred goals.

Objectives: The objective of this review was to summarise best practices for the management of DM at the end of life, with particular focus on therapeutic simplification, prevention of acute glycaemic events, and alignment of treatment with palliative-care principles.

Methods: A narrative review was conducted drawing on current clinical guidelines—particularly those of the American Diabetes Association—and relevant scientific literature addressing diabetes management in palliative-care contexts. Sources were analysed to identify recommended treatment targets, pharmacological strategies, and approaches that minimise discomfort and optimise quality of life.

Results: Across the literature, glycaemic targets are consistently relaxed in end-of-life settings, with acceptable capillary glucose values generally ranging between 180 and 360 mg/dL, provided they do not cause symptoms. Measurement of HbA1c is deprioritised due to its limited applicability in short prognostic horizons. Simplifying therapy is central: in type 2 DM, gradual discontinuation of oral antidiabetic agents is often appropriate; in type 1 DM, low-dose basal insulin may be continued to prevent ketoacidosis. A palliative approach emphasises comfort, vigilance for hypoglycaemia, symptom relief, and ongoing adaptation of treatment based on clinical status and patient preferences.

Discussion: Evidence indicates that metabolic control at the end of life should focus on avoiding symptomatic extremes rather than achieving strict targets. Diet can be liberalised, and treatment intensity reduced. Nevertheless, further research is needed to strengthen evidence-based recommendations in this field.

Conclusion: Therapeutic simplification and symptom-focused management represent best practice for DM at the end of life. Aligning treatment with palliative-care principles improves comfort and reduces the risk of metabolic complications. Continued investigation is required to support consistent clinical decision-making. Keywords: Diabetes Mellitus; Palliative Care; Hypoglycemia; Insulin

ID 910- Strengthening Primary Care Quality, Prevention and Workforce Capability Through Structured Education on Diabetic Foot Assessment and Complication Prevention

Victoria ELLIS, Carl DEANEY, Natalie DALY

No, Lincolnshire, Royaume-Uni

Context: Diabetic foot complications contribute substantially to morbidity, hospitalisation and lower-limb amputation worldwide. Early detection of neuropathy, peripheral arterial disease and structural abnormalities is central to effective prevention. WONCA Europe highlights the importance of prevention, continuity, quality improvement and workforce development in primary care. Despite clear guidelines, variability in assessment technique and clinical confidence persists across healthcare teams, underscoring the need for structured, evidence-based training.

Methods: A multidisciplinary education programme was developed incorporating guideline-based teaching, pathophysiology, risk classification frameworks and practical demonstrations. Training covered anatomy of the diabetic foot, mechanisms of neuropathy and vascular disease, monofilament testing, pulse palpation, visual inspection techniques, assessment of footwear and early identification of high-risk findings. Participants engaged in supervised hands-on practice. Evaluation included pre- and post-training knowledge assessments, direct skills observation and structured staff feedback to assess confidence, perceived relevance and areas for ongoing support.

Originality: To design, deliver and evaluate a structured educational programme aimed at improving healthcare staff knowledge, competence and confidence in performing guideline-concordant diabetic foot assessments, while strengthening understanding of the principles u

Lessons learned and future implication: Challenges may include limited time for training, variability in prior experience and the need for ongoing competency refreshers to ensure sustainability.

Discussion: Providing structured education is expected to improve standardisation of diabetic foot assessment across primary care, enhance early detection of risk factors and strengthen staff communication with patients regarding self-care and prevention. Increased confidence in assessment technique supports more proactive management and consistent delivery of preventative advice.

Conclusion: A structured diabetic foot assessment education programme can strengthen quality of care, improve workforce capability and reduce the risk of preventable foot complications. Embedding such training within primary care aligns with WONCA principles by enhancing prevention, continuity, professional development and patient safety, ultimately supporting better long-term outcomes for individuals living with diabetes.

ID 906- Strengthening Patient Empowerment, Prevention and Community-Oriented Primary Care Through a Structured Diabetes Complications Education Programme

Victoria ELLIS, Carl DEANEY, Victoria SCOTT

No, Lincolnshire, Royaume-Uni

Context: Diabetes mellitus (DM) is a major contributor to global morbidity, mortality and healthcare burden. Cardiovascular complications—including stroke and myocardial infarction—and microvascular complications such as chronic kidney disease, retinopathy and neuropathy significantly reduce quality of life and increase long-term care needs. WONCA Europe emphasises prevention, patient empowerment, health literacy and continuity of care as core principles of family medicine. Structured diabetes education supports these goals by improving understanding of disease mechanisms, risk factors and early symptom recognition, enabling patients to participate actively in self-management.

Methods: A patient-centred education programme was developed using interactive teaching methods, visual resources and practical demonstrations. Content included mechanisms and risk factors for major complications, warning signs, preventive strategies, lifestyle modification, medication adherence and glucose monitoring. Participants engaged in complication-specific self-care discussions. Evaluation measures included pre- and post-session knowledge assessments, feedback questionnaires and indicators of behavioural change such as adherence to monitoring or attendance of screening. Qualitative feedback was analysed thematically to explore confidence, perceived understanding and barriers to effective self-management.

Originality: To develop, deliver and evaluate a structured diabetes education programme designed to improve patient awareness of key diabetes-related complications—stroke (HEAD), myocardial infarction (HEART), kidney disease (KIDNEY), retinopathy (EYES) and neuropathy

Lessons learned and future implication: Challenges include engagement, tailoring materials to diverse learning needs and ensuring continuity of education beyond the initial sessions. Strengthening communication between clinicians and patients was identified as a key facilitator of effective beh

Discussion: Improved awareness of complications is anticipated to support earlier recognition of symptoms, enhance engagement with treatment and increase uptake of preventive interventions. Interactive, visual and accessible education improves comprehension and address varying levels of health literacy.

Conclusion: A structured diabetes complications education programme has the potential to significantly improve patient knowledge, encourage proactive self-management and reduce the incidence and progression of diabetes-related complications. Integrating such programmes within routine primary care aligns with WONCA principles by enhancing prevention, continuity and patient empowerment, ultimately improving long-term outcomes and quality of life.

ID 848- Therapeutic Inertia in Prediabetes Management Among General Practitioners in Poland

Karolina KŁODA [(1)] , Justyna LEDWOCH [(2)], Mateusz BABICKI [(3)], Aleksander BIESIADA [(4)], Agnieszka MASTALERZ-MIGAS [(3)]

(1) Polish Society Of Family Medicine, Szczecin, Pologne
(2) Polish Society Of Family Medicine, Kraków, Pologne
(3) Department Of Family Medicine, Faculty Of Medicine, Wroclaw Medical University, Wrocław, Pologne
(4) Polish Society Of Family Medicine, Gdańsk, Pologne

Context: Therapeutic inertia remains a major barrier to effective chronic disease management. In type 2 diabetes mellitus (T2DM), this phenomenon is well documented and contributes to delays in achieving glycaemic targets and increased risk of complications. Prediabetes, a clinical state preceding T2DM, is equally important: cardiometabolic risk increase, and microvascular complications may develop. Despite its significance, prediabetes frequently receives insufficient attention in primary care, creating a potential area for therapeutic inertia among general practitioners (GPs).

Objectives: The aim of this study was to assess the 1) knowledge, 2) attitudes, 3) clinical practice of family physicians in Polan in relation to prediabetes management. We tested the hypothesis that the actual knowledge of physicians is lower than

declared, which translates into attitudes and clinical practice.

Methods: A cross-sectional online survey (Computer-Assisted Web Interviewing, CAWI) was developed and distributed to family physicians/general practitioners in Poland via professional mailing lists, social media channels, and communication platforms of the Polish Society of Family Medicine (PTMR). The questionnaire consisted of 20 items across the following domains: (1) knowledge of prediabetes diagnostic criteria; (2) attitudes toward preventive screening; (3) clinical practices related to lifestyle counselling and pharmacologic management; and (4) perceived clinical relevance of prediabetes. Participation was voluntary and anonymous.

Results: The survey is expected to provide detailed insights into current knowledge, screening behaviours, and management approaches applied by Polish GPs. Anticipated findings include identifying gaps consistent with therapeutic inertia observed in T2DM management, such as underuse of recommended diagnostic tests, delayed initiation of interventions, and low prioritization of prediabetes in clinical workflows. These results may reveal discrepancies between guideline recommendations and real-world practice.

Discussion: Based on other research conducted by the PTMR, we observe therapeutic inertia in various areas (e.g. pain management) resulting from a false assessment of GPs of their own high level of knowledge combined with suboptimal clinical practice and false beliefs.

Conclusion: The expected outcomes will support the identification of specific educational needs among GPs in Poland. Based on these findings, the PTMR plans to design targeted educational interventions aimed at reducing therapeutic inertia, strengthening early detection, and improving the overall quality of prediabetes management in primary care.

ID 2088- Evaluation of a parental education intervention on childhood fever during general practice home visits by SOS Médecins Lyon

Bertois PAULINE, Hadrien GÉRARD

Sos Médecins France, Lyon, France

Context: Childhood fever is a common reason for medical consultation and a major contributor to healthcare use. Inappropriate consultations, driven by fever phobia and insufficient parental knowledge, contribute to healthcare system overload. Although fever phobia is culturally rooted, multimodal parental education can improve knowledge and promote more appropriate healthcare-seeking behavior, particularly in primary care.

Objectives: To evaluate the effectiveness of a multimodal parental education intervention on childhood fever. The primary outcome was improvement in parental knowledge of fever-related warning signs. Secondary outcomes included overall fever knowledge and parental confidence.

Methods: This study comprised a descriptive analysis followed by a matched pre–post comparative analysis of parents' knowledge after an educational intervention among those contacting SOS Médecins for childhood fever. Data were collected within the SOS Médecins Lyon population between February and June 2024, with baseline assessment during home visits and follow-up five days later. The intervention combined quizzes, patient information leaflets, general practitioner-delivered advice, and a video.

Results: Overall, 142 parents completed the first quiz and 96 the second, yielding a response rate of 67.6%. Parents were predominantly aged ≥35 years (58.5%), living alone (19.7%), unemployed (28.2%), and receiving social assistance benefits (33.1%). Pre–post analysis showed significant improvements in general knowledge, understanding of severity criteria, and confidence in managing a febrile episode (all $p < 10^{-4}$). Similar improvements were observed among parents receiving social assistance.

Discussion: Parents consulting SOS Médecins for childhood fever showed baseline characteristics similar to emergency department populations but with greater socioeconomic vulnerability. A home-based, multimodal parental education intervention significantly improved knowledge of fever severity criteria and parental confidence, particularly among disadvantaged parents. These findings support integrating parental education into out-of-hours primary care to improve healthcare-seeking behavior.

Conclusion: In a socioeconomically vulnerable population managed by SOS Médecins, a home-based multimodal parental education intervention significantly improved parental knowledge and confidence. These findings support parental education as a key primary care strategy and warrant evaluation of its long-term impact on reducing unnecessary consultations. MeSH : Fever; Child; Patient Education as Topic; Primary Health Care; General Practice; Socioeconomic Factors; Home Care Services

ID 1595- Association Between Overweight and Obesity and the Frequency of General Practice Consultations among Children Aged 2–17 Years: A French Retrospective Cohort Study

Théo DUGUET

Sorbonne Universite, Paris, France

Context: Childhood obesity and overweight are increasing, with short-, medium- and long-term consequences for children and for healthcare systems. Data on how a child's Body Mass Index (BMI) category affects primary healthcare use in children remain limited, especially in France.

Objectives: This study assessed the association between overweight and obesity and general practice (GP) consultation rate in children aged 2–17 years.

Methods: A retrospective cohort study (2012–2022) from the PRIMEGE health data warehouse was established. International Obesity Task Force (IOTF) criteria were used to define BMI categories (underweight, normal BMI, overweight and obesity). The primary outcome was to estimate the change in consultation rates after transitions from normal BMI to overweight and overweight to obesity. An interrupted time-series analysis was conducted with a negative binomial and zero-inflated mixed model.

Results: A total of 1,321 children were included in the analysis, accounting for 43,069 consultations. The transition from normal BMI to overweight was concerning 1,126 children and was associated with an increase in consultation rates of 42.4% [33.4%; 52.1%]. The transition from overweight to obesity concerned 195 children with an increase of 61.6% [35.2%; 93.4%].

Discussion: The results of this study regarding the role of obesity in increased general practice consultations are consistent with the existing literature, whereas the pattern observed among children with overweight has not, to our knowledge, been previously reported. Owing to the self-controlled design, this study accounts for numerous confounding factors, including unmeasured ones, thereby strengthening the findings, although the real-world nature of the data may introduce bias, particularly selection bias.

Conclusion: This study shows that increases in BMI categories are associated with higher GP consultation rates among French children. These findings underscore the need for preventive strategies and to consider the specific healthcare needs of children with excess weight.

ID 397- Modalities of Proton Pump Inhibitor Prescription in Infants Under One Year of Age for Gastroesophageal Reflux

Isabella MARINO, Manon JAN

Dumg Rouen, Rouen, France

Context: Infant regurgitation is a physiological phenomenon affecting 50–70% of infants. Gastroesophageal reflux disease (GERD) is less common (12.6%) in infants. According to French guidelines, when the GERD is confirmed by pH-metry, it may justify proton pump inhibitor (PPI) treatment, prescribed off-label before the age of one (<1Y). However, PPI prescriptions for infants <1Y in primary care continue to rise in France.

Objectives: The objective of this study was to describe the proportion of GPs who had prescribed a PPI for GERD in infants <1Y and the conditions surrounding these prescriptions.

Methods: A quantitative, observational, descriptive, and cross-sectional study was conducted between 12/2024 and 06/2025 through an online questionnaire distributed to general practitioners. Bivariate analyses were performed to explore potential associations between the collected variables. The p-value was set at <0.05 for statistical significance. Logistic regression was conducted to identify factors independently associated with specific prescribing practices

Results: A total of 204 questionnaires were analysed. Overall, 55.7% of GPs had prescribed a PPI to an infant <1Y, most often after specialist advice (23%) or pH monitoring (7.1%). Only 9% of the respondents mentioned the term “off-label” on the prescription. Fifty-one percent had prescribed a CMPA formula, with 25% doing so after PPIs. GPs who prescribed a CMPA formula were 7.6 times more likely to request a CMPA blood test ($p < 0.001$).

Discussion: Most GPs did not follow the 2024 French guidelines and prescribed PPIs without prior diagnostic testing, seemingly relying on international recommendations (NASPGHAN/ESPGHAN). The difficulties resulted from the diagnostic complexity of GERD in infants, parental pressure, and limited access to specialists. The prescription of CMPA formula sometimes after PPI failure seems to reflect a reversal of the recommended algorithm. These findings highlight the need to strengthen continuing medical education. The mention "off-label" is required by law, the lack of disclosure exposes practitioners to medico-legal risk.

Conclusion: It is probably necessary to review the guidelines and the marketing authorization under one year old. Further research, including a study on parental perceptions of PPI effectiveness and, afterwards a pragmatic randomized trial in primary care, is needed to evaluate their real-world effectiveness in outpatient settings.

ID 742- The influence of childcare on high antibiotic use in a multicultural, lower socioeconomic community.

Andrew KNIGHT [1] , Iqbal HASAN [2], Chun Wah Michael TAM [1], Rana QUMMOUH [3], Angie SHEHATA [4]

(1) University Of New South Wales, Sydney, Australie
(2) University Of Wollongong, Sydney, Australie
(3) South Western Sydney Local Health District, Sydney, Australie
(4) Fairfield Council, Sydney, Australie

Context: Childcare workers and carers using childcare in a multilingual, lower socioeconomic, culturally diverse local population in XXX. The population sampled has the second highest use of antibiotics amongst children in XXX, a country with very high antibiotic use. Childcare has been identified internationally as a possible driver of antibiotic use in children.

Objectives: The aim of this study was to investigate the knowledge, attitudes and behaviours of childcare workers and parents/care givers regarding antibiotic use in children attending childcare in a culturally and linguistically diverse community.

Methods: In this qualitative study parents and childcare workers from a large, culturally diverse, lower socioeconomic, multilingual local government area were purposively sampled to maximise diversity, including English speakers and those preferring other languages. Recruitment was hampered by the COVID-19 epidemic. Semi-structured telephone interview transcripts were thematically analysed using methodology proposed by Braun and Clark.

Results: Eighteen childcare staff and 20 parents were interviewed, drawn from 7 participating

services. Interview findings were grouped under two major themes: the culture regarding antibiotic use and the regulatory and administrative environment of childcare centres. Interview responses demonstrated interaction between themes and provided insights into the knowledge, attitudes, and behaviours of staff and parents/carers in relation to antibiotic use.

Discussion: The study did not find evidence of explicit pressure to obtain antibiotics for children. The themes appeared to work together to increase antibiotic prescriptions. Parents and care providers expressed beliefs in antibiotic efficacy for numerous conditions, contrary to scientific knowledge and public health messaging. Respondents were unaware that antibiotic use in the region is unusually high. The regulatory and administrative context governing attendance during illness does not seem to overtly drive antibiotic seeking behaviour. However, parents expressed an imperative to work which appeared to drive adoption of strategies perceived to shorten illness, including using antibiotics. These factors may also increase doctor attendance seeking certificates to facilitate early return to childcare. Doctor attendance may increase antibiotic prescriptions. These issues deserve further investigation which should also include doctors' perspectives.

Conclusion: Cultural factors and the regulatory/administrative environment of childcare may increase pressure for antibiotic use in the absence of explicit advice to parents to obtain antibiotics

ID 950- Fever Without Source in a Yung Patient: A Diagnostic Challenge in Family Practice

Cortijo IRENE [(1)] , Torres Pastor BELEN [(1)], Caballero Sánchez MANUELA [(1)], Velasquez Rodriguez MARIA ALEJANDRA [(1)], Moriyon Marti CLAUDIA [(2)]

(1) C.s Doctor Cirajas, Madrid, Espagne
(2) C.s Avenida De Aragon, Madrid, Espagne

Context: Fever without source (FWS) in adolescents remains a diagnostic challenge in primary care, where clinicians must differentiate between common self-limiting viral processes and less frequent but potentially serious bacterial, inflammatory, or malignant conditions. A structured approach, an understanding of red flags, and timely referral pathways are essential to ensure both patient safety and the avoidance of unnecessary investigations.

Methods: A 16-year-old male presented to primary care with a 10-day history of vespertine fever up to 39°C, chills, diffuse abdominal pain migrating to the right iliac fossa, vomiting, and diarrhoea. Physical examination showed abdominal tenderness without peritoneal signs. Initial laboratory tests revealed markedly elevated inflammatory markers and mild cytopenias. Due to persistent fever and new abdominal focality, the patient was referred to the emergency department to rule out acute appendicitis. Further evaluation included blood cultures, viral PCR, extended serologies, autoimmune testing, hematologic assessment, abdominal CT, PET-CT, transthoracic echocardiography, and endoscopic ultrasound-guided lymph node biopsy. Imaging demonstrated a splenic infarction and multiple infradiaphragmatic lymphadenopathies. All infectious, autoimmune, and hematologic studies were negative. Histopathology confirmed reactive lymphadenitis. The patient improved spontaneously with supportive care and a brief course of empirical antibiotics, remaining afebrile before discharge.

Originality: This case is particularly relevant to primary care because it represents an uncommon presentation of FWS in an adolescent, with imaging and laboratory findings that initially suggested serious pathology. It highlights the crucial role of primary care clin

Lessons learned and future implication: This case underscores the importance of monitoring cytopenia recovery, ensuring resolution of systemic symptoms, and maintaining vigilance for late lymphoproliferative manifestations. Coordinated diagnostic pathways between primary and secondary care prev

Discussion: Despite alarming imaging findings, the final diagnosis was a benign reactive process. This case illustrates the importance of structured assessment in primary care, early identification of red flags, and thoughtful escalation.

Conclusion: Significant radiological abnormalities in FWS may still correspond to self-limited disease, emphasising the value of continuity and clinical judgement in primary care

ID 881- Determinants of General Practitioners' Initiation of Conversations about Childhood Overweight: A mixed-methods study

Celine DELHEZ, Rianne VAN DER KLEIJ, Rimke VOS, Hedwig VOS, Marieke ADRIAANSE

Leiden University Medical Center, Leiden, Pays-Bas

Context: Childhood overweight is a major health concern with long-term consequences. Dutch guidelines recommend that general practitioners (GPs) screen for overweight in children at every visit, yet GPs infrequently initiate weight-related conversations, citing limited time and concerns about parental reactions as barriers.

Objectives: We aimed to (1) explore barriers and facilitators influencing GPs' initiation of conversations about childhood overweight, identifying determinants with highest potential for change, and (2) examine the role of equanimity, an accepting and non-reactive mindset, and emotional responses in initiating conversations.

Methods: A cross-sectional survey was distributed to GPs (in training) in the Netherlands between March-May 2025. Measures included the Determinants of Implementation Behaviour Questionnaire (based on the Theoretical Domains Framework), validated emotional valence and arousal assessments, Equanimity Scale-16, and single items on self-reported intention to initiate conversations and implementation success. Descriptive and correlational analyses assessed determinants' potential for change, and associations between emotion, equanimity, and intention to initiate were calculated. Open-ended responses were analyzed using content analysis.

Results: A total of 57 GPs completed the survey; 25 were in training and 46 were women. Most reported adequate skills (66%), knowledge (61%), and motivation(74%); yet 25% reported high implementation success. Highest potential for change was found for making initiation a habitual action. Other high-potential determinants included beliefs that raising the topic prompts reflection and action, ease of recalling appropriate action, adequate organizational arrangements, and expected conversation initiation from colleagues. Emotional responses to initiating conversation were evident, with a subset (10–15%) reporting strong reactions in valence and arousal. Valence, in contrast with arousal, was positively associated with initiation ($r=0.45$, $p = <0.001$). Equanimity scores were high but not significantly associated with intention to initiate conversations.

Discussion: More research is needed to explore if the strong emotional charge of these conversations may constitute a barrier, which equanimity could help to overcome.

Conclusion: While GPs express strong intentions to initiate conversations about childhood overweight, actual implementation remains limited. Strengthening habit formation, fostering positive affect, and managing expectations about parental and child responses may stimulate the initiation of weight-related conversations.

Pelvic Pain

ID 1862- The hypnotherapy and acupuncture care pathways of endometriosis patients: an exploratory qualitative study.

Benjamin BASTIAN, Céline BROSSAULT, Léa RIVALS

Department Of General Practice, University Of Rennes-Rennes (france), Rennes, France

Context: Endometriosis is a chronic disease frequently encountered in primary care, affecting 5 to 10% of women. Its management is multidisciplinary, with a central role for the general practitioner, who coordinates the care pathway. In 2022 in XXXX, 52% of patients reportedly had recourse to complementary therapy at least once

for this indication, including hypnotherapy and acupuncture. These therapies, both recognised by the WHO, have demonstrated benefits in this indication. Nevertheless, there are concerns in XXXX about certain practices considered deviant and the risk of patients abandoning conventional care. However, the care pathways of these women remain largely unexplored.

Objectives: To explore the characteristics and determinants of the care pathway of patients using hypnotherapy and/or acupuncture for endometriosis in XXXX.

Methods: Qualitative study based on grounded theory using semi-structured interviews with endometriosis patients who had undergone hypnotherapy or acupuncture, until theoretical saturation. A purposive sample was drawn from patient associations and practitioners of each therapy and extended using snowball sampling. Verbatim transcripts were analysed using double coding, leading to the development of an explanatory model.

Results: These therapies are used at various stages of patients' pathways as an auxiliary treatment, for different purposes depending on the therapy: diagnosis acceptance, preparation for surgery, pain, emotional and psychological management, etc. Trust in the healthcare professional and the characteristics of the complementary care setting are important determinants of the patient experience, among others. Patients are looking for better coordination of this care pathway by healthcare professionals.

Discussion: This innovative study provides a better understanding of the experiences of women who use hypnotherapy and acupuncture to treat endometriosis in XXXX, helping to identify the factors that influence their decision to use these therapies and how they use them. Uncertainties remain about the actual importance of some characteristics of the care pathway.

Conclusion: This study paves the way for a more efficient and coordinated structure for patient care pathways in XXXX, although further studies are needed.

ID 1803- Strengthening interprofessional collaboration in primary care for women's pelvic pain through action research

Gaëlle HORRU, Marie DUPERIER

Université De Nice Côte D'azur, Nice, France

Context: In general practice, women's pelvic pain represents a frequent, multifactorial and complex issue, often leading to significant diagnostic delays and a major impact on quality of life. Its management requires a global and coordinated approach, involving interprofessional collaboration. In the XXX XX XXX area, this issue is part of a dynamic local context, with a diverse healthcare offer and professionals committed to women's health, driven by a desire to strengthen interprofessionnal collaboration.

Objectives: To explore the perceptions, experiences and needs of healthcare professionals in the XXX XX XXX area regarding the management of women's pelvic pain in order to implement a territorial action promoting interprofessional coordination.

Methods: A qualitative grounded theory study was conducted with 17 healthcare professionals practicing in the XXX XX XXX area, based on semi-structured interviews. The collected data were then integrated into an action-research process, which led to the organization of a multidisciplinary networking event bringing together local healthcare stakeholders.

Results: Analysis of the interviews, conducted using cross-coding, revealed three main findings : a lack of specific training of primary care practitioners on women's pelvic pain; an effective informal network of existing local resources, sometimes still unknown to professionals; a need for direct communication and physical networking between practitioners to improve patient pathways. Professionals expressed feelings of helplessness regarding certain situations and difficulties coordinating care, but above all, a strong motivation to collaborate and to improve the care pathway. The interprofessional event generated genuine enthusiasm : 53 attendees, including heads of OB-GYN departments of two hospitals nearby, and an

overall satisfaction in the post-event survey. This confirms the value of creating tangible spaces for meetings and exchanges within the territory.

Discussion: This study highlights that interprofessional cooperation is an appropriate response to the challenges posed by pelvic pain in women. Strengthening training, developing secure communication tools and providing institutional support for local initiatives appear as key levers for sustainably embedding multiprofessional collaboration in primary care.

Conclusion: By combining qualitative and action research, this study translated field needs into collective action. Interprofessional collaboration stands out as an adaptative, formative, innovative response to women's pelvic pain, transforming professional challenges into drivers of change.

ID 1028- Chronic Abdominal Pain: The Key Was in the Abdominal Wall

Lidia LITHGOW [(1)] , Estefania Dolores GONZÁLES [(2)]

(1) Miralbueno Garrapinillos, Zaragoza, Espagne
(2) Avila, Avila, Espagne

Context: Chronic abdominal pain is a frequent and challenging complaint in Family Medicine, often leading to extensive diagnostic testing, repeated specialist referrals, and significant patient distress. Among its under-recognized etiologies is Anterior Cutaneous Nerve Entrapment Syndrome (ACNES), frequently misinterpreted as visceral pathology. Early recognition in Primary Care is essential to prevent unnecessary interventions and to improve patient outcomes.

Methods: We describe a clinical case assessed in a Primary Care setting. The diagnostic process included a comprehensive history, focused abdominal examination, and evaluation with Carnett's sign to distinguish abdominal wall pain from visceral pain. The patient underwent multiple imaging studies (CT, PET-CT, MRI) and several specialist evaluations without achieving a definitive diagnosis. A diagnostic-therapeutic local anesthetic and corticosteroid infiltration was subsequently performed. Clinical evolution and symptom response were monitored during follow-up visits in Family Medicine.

Originality: This case illustrates the delayed identification of ACNES despite exhaustive diagnostic investigations. A simple bedside maneuver—Carnett's sign—ultimately revealed the correct etiology when advanced imaging and specialist referrals were inconclusive. The

Lessons learned and future implication: Abdominal wall pain should be consistently included in the differential diagnosis of chronic abdominal pain. - Training in Carnett's sign and focused abdominal examination should be strengthened within Family Medicine. - Early suspicion of ACNES reduces

Discussion: ACNES remains frequently missed because its diagnosis relies primarily on clinical assessment rather than imaging. This case highlights how thorough physical examination can outperform extensive diagnostic testing when abdominal wall etiologies are considered.

Conclusion: Routine consideration of ACNES and the use of simple clinical tools can enhance diagnostic accuracy, reduce unnecessary interventions, and significantly improve patient care in Primary Care settings.

ID 1022- A co-design approach to inform the development of an Endometriosis Management Plan in Australian primary care

Sharinne CRAWFORD

Monash University, Melbourne, Australie

Context: Endometriosis is a common chronic condition affecting 10% of women of reproductive age worldwide and is a leading cause of chronic pelvic pain (CPP). In Australia, approximately 14% of women are diagnosed with endometriosis by age 44–49, and women can experience delays in diagnosis of 8 years. General Practitioners (GPs), as the first point of contact in the healthcare system, are seeing increased numbers of patients with endometriosis. GPs may face challenges in

diagnosing and managing endometriosis and CPP due to the varied symptom presentation in patients and limited support resources. In response, the Australian Government funded the development of an Endometriosis Management Plan (EMP) to support the diagnosis and management of endometriosis and CPP in primary care settings.

Objectives: To identify: (i) the key components for developing and implementing an EMP to support GPs and patients in the diagnosis and management of endometriosis and CPP; and (ii) the outcomes the EMP should aim to achieve.

Methods: A co-design workshop was conducted online in October 2023, using the Experience Based Co-design methodology to bring together patients with lived experience of endometriosis or CPP, GPs, and representatives from endometriosis and CPP stakeholder organisations. Participants were recruited through convenience, purposive, and snowball sampling. The workshop was audio-recorded and transcribed verbatim. Data were analysed inductively using reflexive thematic analysis.

Results: Forty-three participants across Australia attended the half-day workshop, including patients, GPs, representatives from endometriosis and pelvic pain organisations and project governance members. Four themes and nine subthemes were generated which broadly highlighted the EMP's potential to support GPs in making a preliminary diagnosis, enabling a holistic and patient-centred approach to symptom management, promoting multidisciplinary collaboration by streamlining referral pathways, supporting capacity building among GPs and enhancing patient self-management through improved knowledge and awareness.

Discussion: The co-design process enabled meaningful stakeholder engagement and collaboration, guiding the development of a context-specific, evidence-based EMP, that integrates the latest endometriosis clinical guidelines in an online tool.

Conclusion: The EMP is designed to support GPs and patients experiencing endometriosis and CPP symptoms, and enhance endometriosis and CPP healthcare in Australian primary care settings. The EMP will be released nationally in May 2026.

ID 843- Multidimensional management of endometriosis in primary care: impact on quality of life

Isabelle ROZIER, Mathilde DELABRE

Département De Médecine Générale D'amiens, Université De Picardie Jules Verne, Amiens, France

Context: Endometriosis is a chronic inflammatory disease that affects one in ten women of reproductive age and directly impacts the daily lives of those who suffer from it.

Objectives: The aim of this study was to determine the positive impact of multidimensional care - including the physical, psychological, socioeconomic, sexual and family dimensions - on quality of life.

Methods: This is a cross-sectional study done with women who suffer from endometriosis thanks to a form that was sent to general practitioners, for them to display it in the waiting area of their office, to pharmacies located in the XXX and to online patients associations. Inclusion criteria were women aged over 18 years with a diagnosis of endometriosis (superficial or deep) confirmed by a healthcare professional. A descriptive univariate analysis was first conducted, followed by a multivariate analysis using statistical tests including ANOVA, Student's t-test, Pearson's correlation, and Chi-square tests. Results were considered statistically significant when the p-value was less than 0.05. The study was approved by an ethics committee.

Results: One hundred and fifty-two women were included. Endometriosis had an impact on social, professional and family life for respectively, 90,1%, 88,8% and 53,9% of the surveyed women. For half of them, the financial cost impeded access to adequate medical care. The patients, who received comprehensive care from their general practitioners, showed a significant improvement in quality of life, despite the low referral rates: 39.1% for pain management, 21.7% for financial support, 19.7% for work-related healthcare, and 16.4% for support networks.

Discussion: This study is original due to its quantitative approach, larger sample size, and focus on multidimensional management of endometriosis. Limitations include voluntary participation, online questionnaires, and self-reported data, which may introduce selection and reporting biases. Nevertheless, the study reinforces the importance of comprehensive care.

Conclusion: A global approach including a psychological, socioeconomic and professional support appears essential to improve the patients' quality of life. To achieve this, it may be useful to create a directory gathering all the associations, the regional care sectors and the referring specialists to improve the orientation of the patients.

ID 773- The New Guideline on Dysmenorrhea for General Practitioners

Iris KETEL, Maureen DONK VAN DEN, Vera Christina MERTENS, Miranda KURVER

Nhg, Utrecht, Pays-Bas

Context: In recent years, societal and medical awareness of female-specific conditions has increased across Europe. In the Netherlands, media and patient advocacy groups have called for improved recognition and diagnostic accuracy for conditions such as endometriosis. Dysmenorrhea, one of the most common gynaecological complaints, remains underdiagnosed and undertreated in primary care, resulting in reduced quality of life and considerable societal costs. This guideline represents the first national initiative to provide evidence-based recommendations for diagnosing and managing of dysmenorrhea in general practice. As part of its implementation, an NHG option grid is being developed to enhance shared decision-making for women with dysmenorrhea.

Objectives: To develop and present a comprehensive, evidence-based guideline for general practitioners addressing both primary and secondary dysmenorrhea, focusing on improving diagnostic processes, treatment options, and patient involvement in care decisions.

Methods: A multidisciplinary team of general practitioners, a guideline epidemiologist and a gynaecologist developed the guideline through systematic literature review, expert consensus, and alignment with existing European guidelines on endometriosis (ESHRE 2022, NICE 2024), covering both primary and secondary dysmenorrhea. Key diagnostic and therapeutic challenges in primary care were addressed. For the option grid, mixed-method research with two surveys and two focus groups is conducted to ensure usability and patient-centred design.

Results: The guideline provides: - Enhanced focus on secondary dysmenorrhea causes, particularly endometriosis and adenomyosis. - Recommendations on transvaginal ultrasound: while limited for ruling out endometriosis or adenomyosis, it may aid in diagnosing other causes such as fibroids. - Clarification that imaging is not required before initiating empirical treatment. - Treatment options for both primary and secondary dysmenorrhea, emphasizing shared decision-making. No first-line preference is given between analgesics and hormonal contraception; patient values and preferences guide the choice. An option grid is under development to facilitate this process.

Discussion: This guideline addresses a critical gap in Dutch primary care and is aligned with broader public health efforts to advance women's health. It promotes earlier recognition and management of dysmenorrhea, potentially reducing diagnostic delay and improving outcomes.

Conclusion: The NHG Guideline on Dysmenorrhea offers practical, patient-centred recommendations for general practitioners. Its implementation may enhance care quality and contribute to better health outcomes for women.

ID 432- The efficacy of long-acting reversible contraception as treatment for endometriosis: a systematic review and meta-analysis.

Alissia HUI [(1)] , Sharinne CRAWFORD [(2)], Sangita CHAKRABORTY [(2)], Danielle MAZZA [(2)]

(1) Department Of General Practice, Monash University And National Endometriosis Clinical And Scientific Trials Network, Melbourne, Australie
(2) Department Of General Practice, Monash University, Melbourne, Australie

Context: XXX guidelines recommend progestin-releasing long-acting reversible contraception (LARC), including levonorgestrel-releasing intrauterine devices (LNG-IUS) and etonogestrel implants, as first-line treatments for endometriosis in primary care.

Objectives: This systematic review and meta-analysis aimed to determine the efficacy of LARC as a treatment for endometriosis, and investigate differences by sub-populations with endometriosis.

Methods: The study was registered prospectively. Medline, Embase and CENTRAL databases were searched from January 1990 to January 8 2025. Eligible studies were published randomised and clinical controlled trials (RCTs and CCTs) comparing progestin-releasing LARC (with or without laparoscopy) with pharmacological, surgical, placebo or expectant management treatments for endometriosis. Studies rated as 'high-risk' of bias for random sequence generation were excluded. Two reviewers independently screened the studies, extracted outcome data and assessed the quality of included studies using the Cochrane Risk of Bias 2 tool. Data was synthesised using fixed-effects model meta-analyses and narrative syntheses. Certainty of the evidence was assessed using GRADE.

Results: Of the 770 studies identified, ten RCTs were included, with 499 participants. Sample sizes ranged from 22 to 103 participants. Eight studies had 'high-risk' of bias. The treatment benefit of LNG-IUS with laparoscopy was greater than expectant management post-laparoscopy for dysmenorrhoea (MD -2.07 [95%CI -3.29, -0.85]; very-low certainty evidence), dyspareunia (MD -1.39 [95%CI -3.22, 0.45]; very-low certainty evidence) and noncyclic pelvic pain at 12 months (two trials), and less than leuprolide acetate for endometriosis-related pain at 6 months when used without laparoscopy (MD 0.17 [95% CI -0.4, 0.74]; moderate certainty evidence, two trials). LARC offered comparable quality of life benefits, safety, treatment satisfaction and efficacy for dysmenorrhoea and persistent pelvic pain to other hormonal treatments for endometriosis; very-low to moderate certainty evidence. The data was unsuitable for investigating sub-population differences.

Discussion: The efficacy of LNG-IUS with laparoscopy was superior to laparoscopy alone, and the efficacy of progestin-releasing LARC was comparable to other hormonal treatments for endometriosis. However, the certainty of evidence was reduced by the imprecision and quality of included studies.

Conclusion: There is a need for robust, well-powered RCTs for LARC treatment for endometriosis. These findings validate LARC's use as efficacious, safe and acceptable hormonal treatments for endometriosis in primary care.

People at heart: cardiovascular risk

ID 483- Assessing cardiovascular risk in primary care patients: comparison of four validated scores for primary prevention

Julien MORISSON, Maéva ABDALLAH, Valentin VERMÉE, Romain DESVIGNES, Lucile CHERVAUX, Michael TAROUX, Katia MAZALOVIC, Claire ZABAWA

Dmg, Dijon, France

Context: Cardioneurovascular diseases remain the leading cause of mortality in high-income countries and are projected to become the primary global cause of death by 2030. Accurate cardiovascular risk (CVR) assessment is essential for effective primary prevention. While current guidelines emphasize using risk scores to guide treatment, few studies have compared the different validated scores within a real-world primary care population.

Objectives: The objective was to describe CVR levels in primary prévention using four validated scores and to analyze patients' characteristics according to risk level.

Methods: We conducted an observational, cross-sectional multicenter study from January to

February 2022 in two French primary care centers of XXX region. Adults aged 40–69 years without a history of cardiovascular disease were included. CVR was assessed using ESC-SCORE2, Framingham Risk Scale [FRS], CUORE, and Globorisk based on patient's medical records. Médical, biological and treatments date were collected. Patients were categorized as low, moderate, high CVR. Associations between CVR level, patients' characteristics were analyzed using chi-squared tests for categorical variables and t-tests for continuous variables.

Results: A total of 478 patients were included, including 86 (18%) patients without a calculable CV score due to missing data. Patients were classified as high CVR for : 8.2% with ESC-SCORE2, 21.5% with FRS, 2.9% with CUORE, and 2.3% with Globorisk. Overall, 24.2% of evaluable patients were classified at a high risk by at least one score. Among them, 47.4% were receiving statin therapy.

Discussion: This study highlights major discrepancies in CVR stratification depending on the tool used. The large sample, and the simultaneous use of several scores strengthen the validity of this original study. FRS appears to overestimate risk in the French population compared to ESC-SCORE2. Furthermore, the inability to calculate scores for a portion of patients underscores the practical challenges of implementing these tools systematically in routine primary care.

Conclusion: There is substantial heterogeneity in CVR stratification depending on the score applied. These findings highlight the need for risk prediction tools specifically developed for primary care to optimize cardiovascular primary prevention strategies.

Corresponding author: Julien Morisson, julien.morisson@ube.fr

ID 1821- Lifestyle Medicine Assessment and Vascular Age: opportunities for cardiovascular prevention in 17,283 Adults.

Francisco CAMARELLES GUILLEM [(1)] , Eva ARRANZ HOLGUÍN [(2)], Marina GUISADO CLAVERO [(1)], Jonathan BONNET [(3)], José Ignacio CUENDE MELERO [(4)]

(1) Spanish Society Of Family And Community Medicine, Madrid, Espagne
(2) Fundación Mafre Mafre, Madrid, Espagne
(3) Stanford University School Of Medicine, Palo Alto Va, États-Unis
(4) Universidad De Valladolid, Valladolid, Espagne

Context: Cardiovascular disease remains the leading cause of morbidity and mortality worldwide and is strongly influenced by lifestyle. Vascular Age (VA) reflects the age of an individual's blood vessels compared with those of a healthy person and translates cardiovascular risk into an intuitive metric that facilitates risk communication in clinical practice. The Lifestyle Medicine Assessment (LMA) questionnaire, developed by the American Academy of Family Physicians, evaluates five key lifestyle domains using a concise 21-item tool. In Spain, a nationwide health campaign with the participation of primary care, "The Time Machine: Get Ahead of the Future and Gain Years of Life", integrated LMA and VA to promote cardiovascular prevention across 39 cities, involving 17,283 participants between 2022 and 2025.

Objectives: To describe lifestyle habits, clinical parameters and Vascular Age, and to explore their relevance for cardiovascular prevention

Methods: A cross-sectional descriptive study was conducted using anonymized data from 17,283 adults aged ≤85 years. Lifestyle habits were assessed using the LMA total score (0–50) and five lifestyle domains (0–10). Clinical parameters included body mass index (BMI), blood pressure, total cholesterol, smoking status and diabetes. Vascular Age was calculated using standard cardiovascular risk algorithms.

Results: The mean LMA score was 34.2 (SD 6.1), with 41% of participants scoring below 35 points. The most compromised lifestyle domains were physical activity (42% scoring <7 points) and nutrition (38% scoring <7 points). Mean BMI was 27.6 kg/m², and obesity affected 21% of participants. Mean systolic blood pressure was 132 mmHg and mean total cholesterol was 198 mg/dL. Smoking prevalence was 18% and diabetes 9%. Vascular Age exceeded chronological age by a mean of +4.8 years (median +5; interquartile range +2 to +8).

Discussion: These findings show room for improvement in lifestyle behaviours and cardiovascular risk profiles among adults reached through a real-world intervention linked to primary care. The excess in Vascular Age highlights the cumulative impact of modifiable lifestyle factors globally.

Conclusion: The LMA questionnaire combined with Vascular Age identifies priority targets for lifestyle intervention, particularly physical activity and nutrition, offering a scalable and clinically meaningful strategy for strengthening cardiovascular prevention in primary care and community settings.

ID 1547- The DECADE study on patient-centered cardiovascular prevention: Goal achievement and satisfaction

Willy GRÄFE [(1)] , Iris TINSEL [(2)], Maja BÖRGER [(3)], Thomas KLOPPE [(4)], Andy MAUN [(5)], Henna RIEMENSCHNEIDER [(1)]

(1) Department Of General Practice, Faculty Of Medicine Carl Gustav Carus, Dresden University Of Technology, Dresden, Allemagne
(2) Section Of Health Care Research And Rehabilitation Research, Institute Of Medical Biometry And Statistics, Medical Faculty And Medical Center –university Of Freiburg, Freiburg, Allemagne
(3) Institute Of General Practice / Family Medicine, Faculty Of Medicine And Medical Centre – University Of Freiburg, Freiburg, Allemagne
(4) Institute Of General Practice / Family Medicine, Faculty Of Medicine And Medical Centre – University Of Freiburg, Hamburg, Allemagne
(5) Department Of General Practice And Primary Care, University Medical Centre Hamburg-Eppendorf, Freiburg, Allemagne

Context: Cardiovascular diseases are the leading cause of death worldwide and prevention is difficult to implement. Self-assessment of goal attainment using Goal Attainment Scaling (GAS) offers a structured method for assessing individual goal attainment and satisfaction.

Objectives: Analysis examined the frequency, achievement and satisfaction with self-set health goals of patients with at least one lifestyle-related cardiovascular risk factor within the context of GP practice.

Methods: DECADE is a cluster-randomised controlled study with four study arms. Intervention groups received patient materials (IG1 and IG3) and/or additional structured patient-centered consultations with their general practitioner (IG2 and IG3). The patients (n=712) completed questionnaires at the start of the study (t0), after 6 months (t1) and after 12 months (t2). At t1 and t2, health goals, goal attainment (6-point Likert scale) and satisfaction (5-point Likert scale) were assessed. Analyses were performed using medians and group differences using Kruskal-Wallis tests.

Results: At t1 and t2, participants reported a median of six health goals. The most frequently reported goals were healthy eating, regular physical activity and weight loss. Although the patients had largely achieved their goals (Mt1=2.74 [0.33-5.00]; Mt2=2.71 [0.00-5.00]), they were only partially satisfied with achieving the goals (Mt1=2.80 [1.00-5.00]; Mt2=2.75 [1.00-5.00]). Patients who received additional consultations (IG2 and IG3) showed significantly higher GAS scores at t2 than those in groups without consultations (Controll Group and IG1) (M=2.80; M=2.86 vs. M=2.50; M=2.58, p=0.004).

Discussion: The most frequently mentioned goals were lifestyle-oriented. The DECADE intervention supports patients in achieving their health goals. Regular consultations with GPs showed to be helpful.

Conclusion: Structured, patient-centered consultations are beneficial for achieving health goals for patients with cardiovascular risk.

ID 1127- Equity in cardiovascular prevention: socioeconomic variation in SCORE2/SCORE2-OP risk categories in a primary care population

Katia MAZALOVIC, Julien MORISSON, Victorian MUREAULT, Michael TAROUX, Claire ZABAWA

Ufr Santé, Dijon, France

Context: Socioeconomic inequalities are a structural determinant of cardiovascular disease. Although robust evidence demonstrates a persistent social gradient in cardiovascular morbidity and mortality, it is unclear whether this gradient is still detectable once risk is operationalised through standardized biomedical algorithms in real-world primary care. Assessing whether socioeconomic status (SES) influences SCORE2/SCORE2-OP classification is essential for advancing equity-oriented prevention—an objective inherent to primary care's commitment to equitable and solidaristic health systems.

Objectives: To determine whether SES indicators are associated with global cardiovascular risk categories, estimated using SCORE2/SCORE2-OP, in a primary care population undergoing ambulatory blood pressure monitoring (ABPM).

Methods: We conducted a cross-sectional study (2011–2022) in rural Burgundy, France. Consecutive adults referred for 24-hour ABPM were included irrespective of indication. Cardiovascular risk was stratified according to ESC guidelines. SES was operationalised using professional qualification and use of means-tested complementary health coverage. Multivariable logistic regression models evaluated associations between SES and risk strata, following WONCA methodological requirements for quantitative original studies

Results: Among 1,408 participants (mean age 62.6 ± 13.9 years; 53.3% women), 30.9% were classified as low-to-moderate risk, 50.5% as high risk, and 18.5% as very high risk. Office blood pressure was above guideline thresholds in 76.7%. After adjustment for demographic and clinical covariates, low-to-moderate professional qualification was associated with reduced odds of very high risk (OR 0.60; 95% CI 0.37–0.99). No other SES indicator exhibited a stable or clinically meaningful association with SCORE2/SCORE2-OP categories.

Discussion: In contrast with the well-established population-level social gradient, SCORE2/SCORE2-OP displayed low sensitivity to SES variation within this primary care cohort. Several mechanisms may explain this attenuation: constrained granularity of routinely available SES indicators; selection effects introduced by referral for ABPM; and partial homogenisation of cardiovascular profiles among individuals already engaged in risk evaluation. These findings resonate with conceptual framework showing that biomedical quantification may under-represent socially patterned vulnerability in primary care populations, which challenges the discipline's capacity to act upon inequities.

Conclusion: Global cardiovascular risk estimated through SCORE2/SCORE2-OP showed limited socioeconomic stratification in this primary care context. Refining risk assessment tools to better capture social vulnerability appears necessary to support primary care's role in promoting equity in prevention.

ID 1103- Advancing Gender Equity in Cardiovascular Care: Primary Care Professionals' Perspectives on Female ASCVD Risk in Rural England

Carl DEANEY [(1)] , Meredith DONALDSON [(1)], Raj THAKKAR [(2)]

(1) Marsh Medical Practice, North Somercotes, Lincolnshire, Royaume-Uni
(2) Bourne End & Wooburn Medical Centre, Bourne End & Wooburn Green, Bucks, Royaume-Uni

Context: Cardiovascular disease (CVD) is the leading cause of death in women globally, yet persistent inequities remain across diagnosis, treatment and outcomes. Women continue to experience delayed recognition of symptoms, lower treatment intensity and poorer prognosis. WONCA Europe emphasises equity, person-centredness and community orientation, while the World Health Organization (WHO) highlights gender disparities as a major obstacle to cardiovascular prevention. Rural primary care settings face additional barriers linked to access, workforce pressures and sociocultural factors. Understanding how primary-care clinicians perceive female ASCVD risk is essential for addressing inequalities in frontline care.

Objectives: To examine primary-care healthcare professionals' (HCPs) perceptions of female ASCVD

risk, identify barriers to equitable care, and explore opportunities to strengthen gender-sensitive cardiovascular management in rural settings.

Methods: A cross-sectional mixed-methods survey was conducted across two rural English counties (September–October 2025). A total of 107 HCPs completed an anonymous questionnaire. Quantitative items were analysed using frequency distributions and weighted averages. Qualitative free-text responses were examined using Braun and Clarke's thematic analysis. Findings were mapped to WONCA and WHO frameworks to assess alignment with international priorities.

Results: Most respondents (60.2%) agreed that gender influences CVD presentation, yet only 40.9% believed it influenced management, highlighting a discrepancy between diagnostic awareness and therapeutic action. Confidence in identifying female-specific risk factors was moderate (56.7%). A majority (76.6%) felt existing guidelines inadequately address women's CVD risk. Barriers included limited consultation time, under-recognition of atypical symptoms, sociocultural influences on women's help-seeking, insufficient training, and restricted access to diagnostics—issues particularly prominent in rural practice. Participants recommended integrating CVD risk assessment into women's health reviews, enhancing multidisciplinary collaboration, embedding gender-equity audit cycles, and improving public education. Qualitative themes reinforced the need for culturally sensitive communication and stronger organisational support.

Discussion: Findings reveal that although clinicians recognise gendered patterns in CVD, systemic and educational constraints undermine equitable management. These challenges mirror WHO concerns and reflect departures from WONCA's equity-driven principles.

Conclusion: Strengthening gender-sensitive cardiovascular care in rural primary care requires improved training, adapted guidelines, enhanced diagnostic access and equity-focused audit structures. Community-based health literacy initiatives and integrated multidisciplinary approaches are essential to improving early recognition and long-term outcomes for women.

ID 497- Intersecting Hearts: Social Patterns of Cardiovascular Disease Across Europe

Margarida PEREIRA SILVA [(1)] , Juan A LOPEZ RODRIGUEZ [(2)], Luis A GIMENO-FELIU [(3)]

(1) Urbano I Primary Care Center;rey Juan Carlos University-Preventive Medicine And Public Health Department; Gdt Semfyc Inequidades En Salud Y Salud Internacional., Merida, Espagne
(2) General Ricardos Primary Care Center; Rey Juan Carlos University-Preventive Medicine And Public Health Department;semfyc International Officer; Redissec/ricapps Investigator., Madrid, Espagne
(3) San Pablo Primary Care Health Centre; Epichron Research Group; University Of Zaragoza, Zaragoza, Espagne

Context: Cardiovascular disease (CVD) remains the leading cause of morbidity and mortality in Europe, with persistent disparities across sociodemographic groups. Socioeconomic inequalities, migration, and urbanization have intensified concerns about how intersecting social determinants—such as sex, income, country of birth, and area of residence—shape CVD risk. Traditional analyses often overlook the compounded effects of these factors, necessitating intersectional approaches to inform equitable public health strategies.

Objectives: This study aimed to analyze intersectional patterns in major CVD prevalence (myocardial infarction, coronary heart disease, and stroke) using data from the European Health Interview Survey (EHIS) 3. Objectives included quantifying CVD prevalence across key sociodemographic factors, estimating independent and joint effects using logistic regression and interaction models, and identifying high-risk subgroups through odds ratios and average marginal effects.

Methods: A cross-sectional analysis was conducted using EHIS 3 data from 248,908 adults across 30 European countries. CVD prevalence was based on self-reported diagnoses. Multivariable logistic regression models estimated odds ratios (ORs), adjusting for age and covariates. Interaction terms assessed intersectional effects, and average marginal effects (AMEs) quantified predicted probabilities. Sensitivity analyses tested robustness.

Results: Women had lower odds of CVD than men (OR: 0.744; AME: –2.1%). Low-income individuals had higher odds than those with medium-high income (OR: 1.761; AME: +4.1%). Compared to native-born individuals, those born in EU and non-EU countries had lower odds (ORs: 0.784 and 0.600). Rural residence had minimal effect (OR: 1.020). Intersectional disparities emerged: men with low income, born in the EU, and living in urban areas had the highest odds (OR: 2.08), followed by native-born men (OR: 1.82). Women with low income and native-born status also had elevated odds (ORs: 1.41 and 1.35), while women with medium-high income born outside the EU had lower odds (OR: 0.35).

Discussion: Findings reveal compounded disadvantage among low-income and migrant populations, especially women. The results emphasize the need for intersectional frameworks to identify and address structural inequities in cardiovascular health.

Conclusion: The results underscore the limitations of one-dimensional analyses and the necessity of intersectional frameworks to identify high-risk groups.

ID 445- Cardiovascular risk management after hypertensive disorders of pregnancy and gestational diabetes: a narrative review

Sam VAN SMOORENBURG [(1)] , Stella WEILAND [(2)], Petra VAN PEET [(1)], Hedwig VOS [(1)], Irene VAN VALKENGOED [(3)], Lilian PETERS [(2)], Annelieke PETRUS [(1)]

(1) Lumc, Leiden, Pays-Bas
(2) Umcg, Groningen, Pays-Bas
(3) Amsterdam Umc, Amsterdam, Pays-Bas

Context: Women who experience hypertensive disorder of pregnancy (HDP) and/or gestational diabetes (GD) face an increased risk of cardiovascular disease (CVD). To reduce this risk, cardiovascular risk management (CVRM) in primary care is essential, yet guidelines and implementations vary.

Objectives: This review offers an overview on CVRM for women after HDP and/or GD. First, we compare recommendations for CVRM in (inter)national guidelines. Second, we evaluate the effect of lifestyle interventions in these women. Third, we identify barriers and facilitators for implementation of CVRM on the level of women, social context and healthcare professionals

Methods: A narrative review was done. PubMed was systematically searched from start to September 2025 for published clinical guidelines on CVRM after HDP/GD beyond the immediate postpartum period, studies on lifestyle interventions after HDP/GD and barriers and facilitators for implementing CVRM for this population. Studies limited to postpartum care (≤ 6 weeks postpartum) were excluded. Two researchers independently performed abstract screening, full text screening, and data extraction.

Results: Guidelines on CVRM after HDP generally recommend informing women of their increased CVD risk and blood pressure measurement, with most guidelines additionally recommending comprehensive cardiovascular risk assessment (i.e. weight, glucose, lipids, proteinuria). Guidelines for follow-up after GD typically recommend a glucose test every 1-3 years. Screening for cardiovascular risk after GD is recommended in few guidelines. Although multiple studies indicate that lifestyle counselling is effective for long-term cardiovascular risk reduction, the evidence for this intervention remains inconclusive. Finally, barriers to CVRM implementation include lack of knowledge, self-scheduling, and limited time for women, while facilitators include receiving reminders, involvement of family for women and structured guidelines for healthcare professionals.

Discussion: The clinical guidelines differ in their recommendations. Also, studies on lifestyle interventions differ in their clinical effectiveness, mainly due to a lack of comparable lifestyle interventions with uniform outcomes. Future research should focus on long-term, cardiovascular outcomes, as well as on the experiences and preferences of CVRM in different social contexts to facilitate implementation.

Conclusion: Substantial variation exists in guidelines' recommendations on CVRM after HDP/GD. Standardized, integrated guidelines combined with feasible implementation strategies are essential to improve cardiovascular prevention in this high-risk population.

Planetary health

ID 1894- Development and evaluation of an information resource on sustainable eating for patients

Charlotte GOOLAERTS [(1)] , Loïc BLANCHET-MAZUEL [(2)], Zoé GINDT [(3)], Lucie CHARRETON [(3)]

(1) Aix-Marseille University, Villeneuve-Lez-Avignon, France
(2) Alliance Santé Planétaire, Saint-Génis-Les Ollières, France
(3) Aix-Marseille University, Marseille, France

Context: Diet is a key factor in human health and has a significant impact on our environment. Promoting sustainable diets generates co-benefits for both health and the environment. General practitioners, who play a key role in prevention, could use an educational tool to help patients make more sustainable food choices.

Objectives: Creation and qualitative evaluation of an information resource on sustainable eating for patients

Methods: The content of the resource is based on a review of the literature on the co-benefits of a sustainable diet for health and the environment, as well as on recommendations from various official bodies. It was validated using a Delphi method, in accordance with guidelines and Campbell criteria. The readability and acceptability of the booklet were assessed through semi-structured interviews with patients.

Results: The resource presents 50 recommendations for a sustainable diet, validated by 12 experts through three rounds of a Delphi process conducted in 2024. The interviews revealed that its acceptability depended on factors such as participants' knowledge, individual perceptions, and socio-demographic profile. The "traditional" diet was perceived as balanced and was often associated with a rural identity and local terroir products. The notion of "appropriate consumption" of animal-based products was rarely questioned; it remained abstract and closely linked to individual representations. The detrimental effects of meat consumption on health and the environment were poorly understood. Sustainable diets were perceived as restrictive and complex, requiring a long and difficult process of change and more specific knowledge.

Discussion: Recent research shows that patients recognize the impact of climate change on their health, but do not fully appreciate the impact of diet on the environment. Although the resource sometimes lacked clarity on certain concepts, it helped enhance participants' knowledge and initiated reflection on their dietary practices.

Conclusion: This study led to the development of an initial informational booklet, which appears to be a relevant tool for facilitating discussions with patients about the links between diet, health, and environmental impacts. This work suggests that tailoring messages to different individual representations would maximize adherence to the topics addressed. Future interventional studies would be needed to test and refine these adaptations in real-world conditions.

ID 1509- Integrating planetary health into consultations: a practical guide

Loïc BLANCHET-MAZUEL

Université Grenoble Alpes, Saint Genis Les Ollières, France

Context: The crossing of planetary boundaries linked to human activities represents an increasingly serious threat to the health of populations and individuals. It is necessary to address the issue of the impact of healthcare on the environment, which is a pressing concern in the profession. The planetary health working group of XXX is working to develop tools to facilitate the integration of planetary health into the daily practice of general

practitioners. The aim of this work was to draft a practical guide bringing together the different aspects of planetary health in general medical practice and the tools already available.

Methods: This is a qualitative collective work based on a narrative review of the literature. A specific working group was set up to work on the issue and validate relevant information by consensus, based on the most recent scientific evidence.

Originality: The originality of this work lies in the integration of planetary health into all aspects of professional practice, through the lens of general medical consultation. The co-benefits described allow the subject to be approached in different ways, and then

Lessons learned and future implication: At first glance, it may seem difficult to add yet another element – planetary health – to everything that general practitioners already have to do within the limited time available for a consultation. That is precisely the purpose of this practical guide:

Discussion: General practitioners are recognised as role models at both the community and individual levels. Professional organisational choices and healthcare practices have an impact on the environment and send a potential message of commitment to planetary health. This practical guide is useful because it provides a roadmap for integrating planetary health into consultations. It encourages reflection on all areas of our practices that are relevant to planetary health.

Conclusion: Integrating planetary health into consultations is one of the solutions for limiting the impact of the healthcare system while improving individual and collective health through co-benefits.

ID 1687- Survey on Sustainability in Primary Healthcare Practice - A Collaborative Study

Paul VAN ROYEN [1] , Radost ASSENOVA [2], Davorina PETEK [3], Alain MERCIER [4], Isabelle AUBIN-AUGER [5], Amelie AIM-EUSEBI [5], Noemi LOPEZ-REY [6], Tuomas KOSKELA [7], Lieve PEREMANS [1]

(1) University Of Antwerp, Antwerp, Belgique
(2) Medical University Of Plovdiv, Plovdiv, Bulgarie
(3) University Of Ljubljana, Ljubljana, Slovénie
(4) Université Paris 13, Paris, France
(5) Université De Paris, Paris, France
(6) University Of Santiago De Compostela, Santiago De Compostela, Espagne
(7) Tampere University, Tampere, Finlande

Context: In response to the growing urgency for sustainable practices in primary healthcare (PHC), a collaborative initiative among European general practitioners (GPs) has been launched. Climate change is increasingly impacting global health, while healthcare itself contributes 4-6% of global CO2 emissions, of which general practice is a notable contributor. To address this issue, a European collaborative study on sustainability in PHC was initiated with support of EGPRN. The study considers various dimensions of sustainability including energy conservation, eco-friendly medical devices, reduction of disposable materials, and the promotion of alternative transportation methods such as cycling for home visits.

Objectives: To explore the current opinions and ongoing interventions related to environmental sustainability among European GPs.

Methods: This mixed-methods project includes two phases. First a cross-sectional survey is being conducted among GPs from European countries, to provide an overview of sustainability practice and attitudes. In the second phase qualitative interviews with GPs in selected countries will explore priorities, relevant experiences and feasible implementation strategies for environmental sustainability.

Results: Surveys are distributed in 10 countries. Preliminary analysis of 1214 responses, shows that 77 % strongly agree, and 19 % agree to some extent that sustainability in PHC is important. However, only 26% reported the existence of a national sustainability policy for PHC in their country. The highest rated and most feasible actions include reducing electricity consumption, longer use of medical equipment and reducing waste. In contrast, reducing medical consumables, reducing staff mobility and decreasing reliance on internal/external laboratory analyses are considered less important and more difficult to

implement. 87% of the respondents gave one or more examples of actions in their practice.

Discussion: Results of this survey clarify GPs' perspectives across countries and show a high attention to sustainability and actions already taken up.

Conclusion: The findings will help identify gaps and define objectives for future research.

ID 597- Eco-prescription in primary care: quantitative principles to reduce the carbon footprint of medicines without compromising quality of care

Matthias BRUNN [(1)] , Frédéric BOUNOURE [(2)], Julien WILS [(3)], Sébastien TAILLEMITE [(4)], Charlotte SIEFRIDT [(3)], Noémie LE CLECH [(3)], Mathilde RÉVEILLON ISTIN [(3)], Mohamed SKIBA [(2)], Céline BOUGLE [(3)], Malika SKIBA [(2)]

(1) Liepp-Sciences Po, Paris, France
(2) Laboratoire De Pharmacie Galénique, Normandie Univ, Unirouen, Nordic, Inserm 1239, Rouen, France
(3) Omedit De Normandie, Caen, France
(4) Ecovamed, Paris, France

Context: Healthcare accounts for about 8% of France's greenhouse gas (GHG) emissions, with medicines representing the largest share (9.1 Mt CO_2eq annually). For general practitioners, prescribing is a daily core activity and a major lever for reducing environmental impact. Yet actionable, quantifiable prescribing principles remain scarce. This study aims to identify simple, reproducible eco-prescription principles that maintain the quality of care while lowering the carbon footprint of commonly used medicines.

Objectives: To quantify the environmental impact of therapeutic choices within and across drug classes and to derive practical eco-prescription principles applicable in general practice.

Methods: We conducted (1) a review of existing recommendations from national/international institutions and scientific societies, and (2) a quantitative analysis of the Ecovamed® database, which provides life-cycle–based carbon footprints for 12,316 oral medicines, extended to selected parenteral forms. Nine commonly prescribed therapeutic classes were analyzed using the Defined Daily Dose (DDD) as functional unit, standardized on a one-month treatment package. Additional analyses explored combined formulations and dosing schemes. The proposed principles were then validated by a multidisciplinary working group of over 100 professionals (physicians, pharmacists, nurses, academics, patient associations).

Results: Five quantitative principles emerged: 1- Prefer dry oral forms over liquid or parenteral formulations (GHG reductions ×2 to ×130). 2- Avoid pressurized inhalers when clinically appropriate (reduction ×10 to ×20 compared with dry-powder devices). 3- Within each therapeutic class, choose the molecule with the lowest DDD (average reduction 29%; up to 48% in some classes). 4- Prefer combined formulations over separate active substances (average reduction 27%). 5- Favor regimens minimizing the number of units administered (mean reduction 37%). These principles showed no increase in reimbursement cost in the comparative example.

Discussion: Eco-prescription offers high-impact, low-cost opportunities for reducing practice-related emissions. Its implementation must remain consistent with clinical guidelines, patient-specific factors (e.g., age, swallowing capacity, inspiratory flow), and safety considerations. Organizational constraints may limit some substitutions in hospital settings, but application in ambulatory care is broad.

Conclusion: Quantified eco-prescription principles can guide GPs toward lower-carbon therapeutic choices without altering care quality. They form a pragmatic foundation for integrating environmental sustainability into everyday prescribing. Submitted on behalf of the full eco-prescription working group.

ID 1112- The climate impact of common hospital discharge medications over the last 10 years

Jane SMITH, David PACHE, Treasure MCGUIRE, Daniel SCHWEITZER, Gaaine HWANG, Timothy HOANG, Youanna BASELYOUS

Bond University, Gold Coast, Australie

Context: Hospital admissions increase the number of patients' medications. Medications cause a significant amount of the carbon footprint from healthcare. General Practitioners provide continuity of therapeutic care after discharge including re-prescribing, in their role as the major prescribers of medications

Objectives: Evaluate the climate impact of common cardiovascular, antimicrobial, and antidepressant drugs prescribed at discharge from a large hospital over 10 years, as well as changes over time Discover the usefulness of the Yewmaker website for prescribing decisions Balance clinical efficacy with environmental impact when choosing equivalent drug options with lower carbon footprint.

Methods: Ten years of discharge prescriptions data from a large hospital for the commonest antidepressants, cardiovascular and antimicrobial drugs, and detected trends, will be assessed. The planetary impact will be assessed using the YewMaker Medication Carbon Footprint (MCF) Changing high-MCF medications to lower-impact MCF will be explored in Yewmaker

Results: The anticipated climate impact of discharge medications is expected to show an increase. Data analysis will be in early 2026 to identify which drugs are the greatest contributors. Most discharge medications have high MCF ratings. Resources show lower MCF equivalents are available. Many antidepressants and antibiotics have high MCF ratings, conversely many cardiovascular drugs have lower MCF ratings, but with little variation amongst equivalents. Yewmaker is an easy-to-use resource with a focus on MCF rating only.

Discussion: Reducing the environmental footprint of discharge medications and medications in general needs a multifaceted approach. The assessment of MCF rating is made far easier by the use of Yewmaker, but additional resources are needed to guide lower MCF choice of clinical equivalence. The expertise and patient centred position of the General practitioner is a critical part of this process and likely to be pivotal to the introduction of bioequivalent lower MCF medications.

Conclusion: Information about trends in discharge medications and the resulting carbon footprint is important to understand. This informs drug changes based on MCF ratings, to reduce the harms to the environment from healthcare. Patient preferences, rational prescribing and deprescribing are important additional factors to use in addition.

ID 698- Clinical Levers for Reducing the Carbon Footprint of Primary Care: Insights from an International Review

Thomas FIERLING [(1)] , Margot AVALLET [(2)], Ludovic CASANOVA [(2)]

(1) Dumg Amu, Ceress, Marseille, France
(2) Dumg Amu, Marseille, France

Context: Health systems generate 4–5% of global greenhouse gas (GHG) emissions, and in France, community-based primary care accounts for nearly one quarter of the national health-sector footprint. Yet the environmental impact of primary care remains insufficiently characterised and seldom examined from the perspective of everyday clinical practice. As ecological transition becomes a strategic priority it is essential to clarify the most significant sources of emissions in order to identify levers that are both clinically relevant and territorially adapted.

Objectives: To synthesise convergent findings from the international literature on the carbon footprint of primary care and to highlight the clinical and organisational levers most pertinent to ecological transition in general practice.

Methods: Systematic review registered in PROSPERO (International Prospective Register of Systematic Reviews).Searches were conducted in MEDLINE, EMBASE, Web of Science and grey literature. We included quantitative studies reporting GHG emissions in primary care settings. Data extraction and quality assessment were performed independently by two reviewers. Nine

quantitative studies were included in the final synthesis.

Results: Across these nine studies, a coherent picture emerges. Medicines consistently appear as the dominant source of emissions, with Scope 3 activities those indirect emissions linked to care pathways accounting for at least seventy percent of the overall footprint. The choice of inhaler proves to be a particularly powerful clinical lever. The carbon impact of a consultation ranges from 4.8 to 10.5 $kgCO_2e$, while emissions attributable to buildings remain modest. Patient travel constitutes a second, but context-dependent, contribution: it becomes particularly significant in rural areas where long distances and car dependency amplify the environmental burden. Teleconsultation, finally, offers environmental benefits only when it replaces a real and substantial journey.

Discussion: Despite marked heterogeneity in methodology and scope across studies, these convergences are robust and align with international calls to address the ecological impact of healthcare by focusing not on technology or infrastructure but on clinical decision-making and the organisation of care. Evidence remains especially scarce for nursing, physiotherapy and other allied health professions.

Conclusion: Ecological transition in primary care depends chiefly on clinical practice and territorial organisation. This synthesis offers a practical and operational framework to guide the decarbonisation of general practice.

Corresponding author: Thomas Fierling, thomas.fierling@univ-amu.fr

ID 688- Environmental sobriety in primary care: perceptions and action levers among healthcare professionals

Thomas FIERLING [(1)] , Romain LUTAUD [(2)], Quynh-Anh PHUNG [(3)], Guillaume OLAGNE [(3)], Enguerran MACIA [(4)]

(1) Dumg Amu, Ceress, Marseille, France
(2) Dumg Amu, Ades, Marseille, France
(3) Dumg Amu, Marseille, France
(4) Ades, Amu, Marseille, France

Context: The ecological transition challenges current definitions of care quality in a context where healthcare systems themselves contribute to environmental pressures. Primary care, situated at the intersection of individual needs and collective responsibilities, provides a unique setting to explore the conditions for “sober care”.

Objectives: To explore how primary care professionals working in multidisciplinary primary care centres (maisons de santé pluriprofessionnelles, MSPs) perceive, experience, and anticipate the implementation of environmentally sober care.

Methods: A qualitative study based on a grounded theory approach was conducted. Six focus groups were organised across six MSPs located in six different departments, reflecting diverse territorial contexts. Thirty-eight professionals from multiple disciplines participated. All interviews were audio-recorded, transcribed verbatim, independently double-coded by two researchers, and triangulated. Thematic saturation was reached during the fifth focus group and confirmed by the sixth.

Results: Three categories emerged from the analysis. First, environmental sobriety appears as an emerging yet imprecise concept. Although associated with reduction or simplification, participants found it difficult to translate into practice due to the absence of reliable indicators. They consistently expressed a need for data, scales, and evidence to guide and legitimise decisions. Second, implementing sober care generates tensions within clinical activity. Professionals described navigating between their intention to reduce environmental impacts, perceived patient expectations, and their responsibility to maintain care quality and preserve the therapeutic relationship. Third, territorial context strongly shapes what sober care can realistically become. Local infrastructure, transport conditions, organisational cultures, and care pathways create both constraints and opportunities.

Discussion: Professionals described how the absence of ecological indicators in primary care leaves them without the evidence they consider necessary to guide or justify environmentally oriented decisions. Their narratives reveal a subtle negotiation between personal ecological aspirations and the clinical, relational, and organisational responsibilities that structure everyday practice. Beyond these tensions, sobriety gradually emerges as a renewed conception of care quality, emphasising relevance, appropriateness, and thoughtful adaptation to local contexts over restriction.

Conclusion: Environmental sobriety emerges as a new dimension of care quality in primary care. Developing ecological indicators, supporting professional training, and incorporating environmental reasoning into routine practice may facilitate a transition toward sustainable models of care.

Point of care

ID 2217- Recognising underestimated symptoms in red eye: a lesson in patient safety

Mariana FERREIRA, Lília ALMEIDA, Felipe VENTURA, Ana Rita MENDES, Bruno TAVARES, Andreia COSTA

Ribeira Grande Health Unit, Ribeira Grande, Portugal

Context: Complaints of “red eye” are common in primary health care. When associated with the absence of conjunctival hyperemia, there is a risk of clinical underestimation, potentially delaying the diagnosis of serious corneal disease. This case highlights the role of focused history-taking as a patient-safety measure.

Methods: A 33-year-old woman with no relevant medical history presented to a basic emergency unit with a five-day history of “ocular redness” without discharge (Manchester triage: green; afebrile). She had self-medicated with topical chloramphenicol without improvement. During history-taking, the patient reported photophobia, mild ocular pain, and tearing, symptoms she initially did not value. She denied contact lens use, pruritus, trauma, visual impairment, or foreign body sensation, although she reported recent exposure to dust during house cleaning. Physical examination revealed no palpebral skin changes or edema, conjunctival papillae, discharge or hypopyon. Ocular motility and visual fields were preserved, and pupils were reactive and regular. A small inferonasal corneal opacity was noted on close observation under light exposure. Ocular irrigation and topical anesthetic provided partial symptomatic relief. After consultation with the on-call ophthalmologist, intensive topical antibiotic therapy was initiated, and the patient was referred for urgent ophthalmology assessment where a small superficial corneal ulcer of the left eye was confirmed. The ulcer was nearly healed, with focal fluorescein uptake and no anterior chamber reaction. Topical therapy was maintained for 15 days.

Originality: The absence of visible hyperemia at initial assessment could have induced anchoring bias, compromising patient safety.

Lessons learned and future implication: In ophthalmological complaints, systematic assessment of red-flag symptoms—such as pain and photophobia—should prevail over initial appearance or the patient’s presenting complaint. Focused clinical history and clear referral criteria may reduce avoidable

Discussion: This case highlights corneal pathology presenting without typical ocular redness, illustrating the limitations of appearance-based assessment. In complaints such as red eye, what is not immediately visible may be more clinically relevant than what is.

Conclusion: A directed clinical history centered on associated symptoms allows recognition of relevant corneal pathology even in the absence of apparent hyperemia, strengthening patient safety in first-line care.

ID 1418- Diagnostic accuracy of history taking and physical examination for suspected benign paroxysmal positional

vertigo in primary care: a diagnostic systematic review

Anna-Marie LEEMEYER [(1)] , Andrew ROSS [(1)], Tjasse BRUINTJES [(2)], Jochen CALS [(3)], Roeland VAN LEEUWEN [(4)], Vincent VAN VUGT [(1)], Otto MAARSINGH [(1)]

(1) Department Of General Practice, Amsterdam Umc Location Vrije Universiteit Amsterdam, De Boelelaan, Amsterdam, 1117, The Netherlands, Amsterdam Public Health, Quality Of Care, Amsterdam, The Netherlands., Amsterdam, Pays-Bas
(2) Department Of Otorhinolaryngology, Leiden University Medical Center, Leiden, The Netherlands; Department Of Otorhinolaryngology, Gelre Hospital Apeldoorn, Apeldoorn, The Netherlands., Leiden, Pays-Bas
(3) Department Of Family Medicine, Care And Public Health Institute (caphri), Maastricht University, Maastricht, The Netherlands., Maastricht, Pays-Bas
(4) Department Of Neurology, Gelre Hospital Apeldoorn, Apeldoorn, The Netherlands., Apeldoorn, Pays-Bas

Context: Vertigo is a prevalent condition in general practice and is highly burdensome for patients. Although general practitioners manage the large majority of patients with vertigo, their 'diagnostic toolkit' has serious limitations. Evidence supporting diagnostic tests is largely received from patients in a secondary or tertiary care setting. Benign paroxysmal positional vertigo (BPPV), the most common peripheral cause of vertigo, has not been systematically reviewed for diagnostic tests suitable for primary care.

Objectives: To assess the empirical evidence on diagnostic tests for patients with suspected BPPV in primary care.

Methods: A systematic search was performed in PubMed, Embase.com, and Web of Science from 1 January 2010 up to 3 June 2024. Studies are included if they evaluate diagnostic tests in adults with vestibular symptoms, and the target condition is suspected BPPV. The tests must be feasible in primary care. Two reviewers will independently assess the methodological quality of the included studies using the Quality Assessment of Diagnostic Accuracy Studies (QUADAS-2). The full-text screening and methodological assessments are currently ongoing.

Results: Preliminary screening identified studies evaluating diagnostic tests in adults with vertigo suspected or diagnosed with BPPV. These studies assess a range of diagnostic tests, such as history taking, physical examination, positional assessments and questionnaires feasible in primary care. Although full-text screening and independent methodological QUADAS-2 are ongoing, the exact number of studies eligible for data extraction and the diagnostic accuracy outcomes are not yet available.

Discussion: Our preliminary findings illustrate that there is a range of diagnostic tests for BPPV that may be feasible in primary care. A systematic appraisal of these tests is needed to determine which elements of history taking, physical examination, and positional assessment can reliably support the diagnosis.

Conclusion: This ongoing systematic review aims to identify evidence gaps and inform which diagnostic tests or test combinations may be most suitable for diagnosing BPPV in primary care. This will guide future research and support more efficient, targeted diagnosis.

ID 1185- Blepharitis in general practice: two-thirds of patients are prescribed medication

Cathrien KAGER [(1)] , Joost VANHOMMERIG [(1)], Robert WISSE [(2)], Bart KNOTTNERUS [(3)]

(1) Nivel, Utrecht, Pays-Bas
(2) Xpert Clinics Eyecare, Zeist, Pays-Bas
(3) Xpert Clinics Eyecare, Utrecht, Pays-Bas

Context: The Dutch GP guidelines advise eyelid margin hygiene as initial treatment for blepharitis. For symptoms lasting longer than one month, topical antibiotics are recommended. Motives for prescribing and treatment choices GPs make are unknown. Also, experiences of patients are unknown.

Objectives: What is the epidemiology of blepharitis in general practice? How often, and what medication is prescribed? How often do recurrences occur? How often is referral to ophthalmology made? What factors play a role in deciding on treatment? How do patients experience these treatments?

Methods: We used data from 2023 from the Nivel Primary Care Database. To calculate incidence and prevalence, we included all patients with ICPC F72 (blepharitis/hordeolum/chalazion). For prescriptions and referrals, we looked at ICPC F72.01 (ICPC subcode blepharitis). A recurrence was defined as a new contact after a contact-free period of at least eight weeks. A contact within eight weeks was considered part of the same episode. We looked at prescribed medications and referrals. Also, we conducted a brief questionnaire survey about treatment choices, motives and experiences among GPs and patients, in which we differentiated between new and a follow-up contacts.

Results: We included 17,973 patients with F72, of whom 5,817 had F72.01. The incidence of F72 was 13.8 per 1,000 people and the prevalence was 15.3. Recurrence occurred in 8% of patients that were certain to have blepharitis (F72.01). 66% of F72.01 patients were prescribed medication for blepharitis (artificial tears, antibiotics, corticosteroids). Fusidic acid was prescribed most frequently (39.7% of all patients with blepharitis, of which 85% at the first contact). 3% of patients with blepharitis (F72.01) were referred to an ophthalmologist. 222 GP and 16 patient questionnaires were filled in. Outcomes of the survey-analysis are pending and expected to be finalized by the time of the conference.

Discussion: By the time of the conference, we expect to have more insights on the found discrepancies between guideline recommendations and our real-world GP data, by adding the results of our GP and patient questionnaires.

Conclusion: Our study shows that GPs prescribe antibiotics for a large proportion of blepharitis patients. The majority is prescribed during the first contact, despite the opposing guideline recommendation.

ID 632- Predicting deep venous thrombosis and pulmonary embolism in community patients with superficial venous thrombosis: a model development study

Florien VAN ROYEN [1] , Maarten VAN SMEDEN [2], Sander VAN DOORN [1], Patrick SOUVEREIN [3], Wouter VAN AMSTERDAM [2], Frans RUTTEN [1], James SHEPPARD [4], Geert-Jan GEERSING [1]

(1) Department Of General Practice & Nursing Science, Julius Center For Health Sciences And Primary Care, University Medical Center Utrecht, Utrecht University, Utrecht, The Netherlands, Utrecht, Pays-Bas
(2) Department Of Data Science & Biostatistics, Julius Center For Health Sciences And Primary Care, University Medical Center Utrecht, Utrecht University, Utrecht, The Netherlands, Utrecht, Pays-Bas
(3) Division Of Pharmacoepidemiology And Clinical Pharmacology, Utrecht Institute For Pharmaceutical Sciences, Utrecht University, Utrecht, The Netherlands, Utrecht, Pays-Bas
(4) Nuffield Department Of Primary Care Health Sciences, University Of Oxford, Uk, Oxford, Royaume-Uni

Context: In general practice, superficial venous thrombosis (SVT) is considered a benign condition, not requiring anticoagulant treatment. However, a small but not insignificant subgroup of patients will develop serious thrombotic complications: deep venous thrombosis (DVT) and/or pulmonary embolism (PE). Tailored anticoagulant treatment in high-risk patients might prevent these complications, yet tools for clinical decision-making are currently lacking.

Objectives: To develop a prediction model to predict DVT and/or PE risk in SVT patients for clinical use in general practice.

Methods: Retrospective data from general practices participating in the longitudinal routine care UK CPRD Aurum database were used, covering a period between 2000 and 2021. A multivariable prediction model was developed in adult SVT patients, predicting the outcome of DVT and/or PE within 90 days after the first consultation for SVT. Prespecified predictors were biological sex, age, (history of) cancer, history of DVT/PE, and absence of varicose veins. The performance was evaluated using bootstrapping and internal-external cross-validation.

Results: Of all identified patients with SVT (n = 293,166, median age 61 [IQR 46 to 73] years, 33% male), 10,301 (3.5%) developed DVT or PE within 90 days. The risk was highest in the first days after SVT consultation: 51% of DVTs/PEs were diagnosed within one week, and 77% within 30 days. The c-statistic of the model was 0.66 (95%CI 0.66 to 0.67), and the model showed good calibration (intercept 0.04, slope 1.01). High-risk patients with a predicted

risk of >5% (9.7% of the total population) had (i) a history of DVT/PE or were (ii) male with (a history of) cancer.

Discussion: The prediction model showed good performance predicting the short-term risk of DVT/PE and identified high-risk SVT patients. Future impact studies should confirm whether this high-risk strategy is better than routine everyday care.

Conclusion: In community SVT patients, the average risk of DVT/PE development within 90 days of follow-up is 3.5%. This simple prediction model could be used to target anticoagulant treatment in high-risk SVT patients.

Corresponding author: Florien Van Royen, f.s.vanroyen-5@umcutrecht.nl

ID 472- Characteristics of patients with ruptured abdominal aortic aneurysm who contacted out-of-hours primary care: a case-control study

Carline VAN DEN DRIES [(1)] , Dave DONGELMANS [(2)], Maarten VAN DER LAAN [(3)], Sonja OOMKENS [(4)], Eva OUWENDIJK [(5)], Annelies VISSER [(2)], Frans RUTTEN [(1)], Dorien ZWART [(1)]

(1) Julius Center Umc Utrecht, Utrecht, Pays-Bas
(2) Amsterdam Umc, Amsterdam, Pays-Bas
(3) Umc Groningen, Groningen, Pays-Bas
(4) Veiliger Zorg, De Meern, Pays-Bas
(5) Neo Huisartsenzorg, Nijmegen, Pays-Bas

Context: Ruptured abdominal aortic aneurysm (rAAA) is rare but it is the second most frequently missed diagnosis reported as sentinel adverse event ('calamity') at out-of-hours services in primary care (OHS-PC).

Objectives: We aimed to identify characteristics that could be useful for telephone triage of suspected rAAA at the OHS-PC.

Methods: In a matched case-control study (1:4 ratio), we compared patients with a missed rAAA (cases) to patients with the same age and sex, and with similar entrance complaint (controls). Data were collected from OHS-PC triage call recordings that were re-assessed by researchers blinded to the case-control status. Patient and call characteristics were univariably assessed with conditional logistic regression analysis.

Results: Twenty cases of missed rAAA between 2013 and 2023 were matched to 80 controls. 40% of the cases presented with abdominal pain, and 35% with back pain. Cases compared to controls more often had a pain onset < 12 h (odds ratio (OR) 15.2; 95%CI 1.9-123.8), reported more sweating (OR 10.1; 95% CI 1.2–86.9, p = 0.035), more often verbally expressed their concern (OR 13.6; 95%CI 3.0-61.3, p = 0.001), and more often called during the night (OR 3.8; 95% CI 1.1–12.7, p = 0.029).

Discussion: This is the first study that assessed determinants related to missed rAAA diagnosis in the OHS-PC setting. The original triage call recordings offered a unique data source and the case-control design avoided hindsight bias in contrast to root-cause analyses that are usually done in case of sentinel events.

Conclusion: Triage, with recognition of and adequate urgency allocation in rAAA patients calling the OHS-PC, remains challenging given its rare occurrence and lack of disease specific symptoms. Nevertheless, this case-control study identified factors that could be useful in triage of patients calling the OHS-PC with symptoms possibly indicating rAAA.

Pregnancy

ID 2277- Pregnancy in Girls Under 14 as a Sentinel Event of Sexual Violence: Implications for Primary Health Care in XXX (2010–2017)

Giovanna GARCIA GARDINI, Arthur MONTEIRO MARQUES MELLO, Mariana HASSE

Faculty Of Medicine Of The Federal University Of Uberlandia, Uberlândia

Context: Pregnancy in girls under 14 years is a sentinel event of sexual violence, as XXX law defines any sexual act in this age group as statutory rape. Primary health care is often the first point of contact, playing a strategic role in identifying

violence, ensuring compulsory notification, and activating protection and care pathways.

Objectives: To analyze how violence involving pregnant girls aged ≤14 years is documented and managed within XXX health services, identifying gaps relevant to primary care and child protection.

Methods: A descriptive ecological study used national data from the XXX Notifiable Diseases Information System (SINAN) from 2010 to 2017. All notifications involving pregnant girls aged ≤14 years were included. Live Birth Information System (SINASC) data contextualized under-recognition. Analysis focused on notification completeness, recurrence, care procedures, referrals, and access to legally guaranteed interventions.

Results: Between 2010 and 2017, 10,864 cases of violence against pregnant girls ≤14 years were recorded, compared to over 212,000 live births in the same age group. Despite legal presumption of sexual violence, documentation was often incomplete, particularly regarding referrals and follow-up. Nearly half of the cases involved recurrent violence, mostly occurring in households and perpetrated by known individuals. Essential primary care interventions - post-exposure prophylaxis for STIs, emergency contraception, referral for legal abortion, and psychosocial support - were rarely documented, indicating limited activation of protection pathways.

Discussion: Pregnancy in young girls is frequently treated as an obstetric or social issue rather than as evidence of sexual violence. This highlights gaps in professional training, normalization of child pregnancy, and weak coordination between primary care, health surveillance, and child protection services, resulting in missed opportunities for early intervention.

Conclusion: Recognizing pregnancy in girls under 14 as a sentinel event of sexual violence is essential to strengthen primary care responses. Empowering family physicians and primary care teams to identify violence, ensure notification, and coordinate rights-based intersectoral care is critical to prevent recurrent abuse and protect children's sexual and reproductive rights.

ID 1733- Proactive Referral in Pregnancy: Pathway to Better Maternal Outcomes

Aisling HANEY [(1)] , Emily CLARK [(2)]

(1) Unaffiliated, Nottingham, Royaume-Uni
(2) Norfolk And Waveney Integrated Care Board, Royal College Of Gp's, Norwich, Royaume-Uni

Context: Progress in reducing infant mortality in England has stalled, with widening inequalities driven by socioeconomic deprivation. Infants and pregnant people living in the most deprived areas experience substantially poorer outcomes, including preterm birth, stillbirth, and maternal mortality. Pregnancy represents a critical opportunity for community interventions addressing the wider determinants of health, including social prescribing and Family Hubs.

Objectives: To evaluate a proactive approach aimed at improving access to community-based support services for pregnant people in socioeconomically disadvantaged communities, focusing on implementation, engagement, health outcomes, and transferable learning for reducing inequalities.

Methods: A one-year mixed-methods service evaluation was conducted using a structure–process–outcome framework. Pregnant people living in the two most deprived neighbourhood quintiles were identified using maternity booking data. The intervention involved proactive outreach, with trained call handlers identifying non-clinical needs and facilitating referral to community support services, including Family Hubs, welfare advice, and social prescribing. Quantitative data included programme activity, referral uptake, and maternity indicators, with pre- and post-pilot comparisons. Qualitative data were collected through Ripple Effects Mapping workshops with multi-agency stakeholders and maternity service user representatives and analysed thematically.

Results: A total of 1,239 pregnant people were identified and contacted; 355 (29%) onward referrals were completed to community support services including Family Hubs and social prescribing. Engagement with family support services increased substantially compared with the pre-intervention period. There was a marked rise in uptake of the offer among pregnant people from the 20% most deprived areas, rising from 28% to 95%. Common reasons for referral included infant

feeding, parenting groups, housing, finances, and mental health. Case examples demonstrate improvements in financial stability, housing safety, and overall wellbeing. Qualitative analysis highlighted strengthened cross-sector collaboration, enhanced understanding of social determinants, and earlier identification of needs.

Discussion: Challenges included individuals who were unreachable and the associated unknown and unmet needs of those not referred or contacted. Strengths included a data-driven population health management approach to proactively identify unmet support needs.

Conclusion: This pilot demonstrates that targeted, proactive outreach can boost engagement with community support services in deprived communities, creating opportunities to address social needs and improve maternal and infant health outcomes.

ID 2107- The mediating role of social support in the relationship between perceived stress and pregnancy distress with self-care among pregnant women

Shabnam OMIDVAR, Sanaz BAHRAMI-SAMANI, Farideh MOHSENZADEH-LEDARI, Alireza AZIZI, Alireza KORDBAGHERI

Social Determinants Ofhealth Research Center, Health Researchinstitute, Babol University Of Medicalsciences, Babol, Iran.email: Shomidvar@yahoo.comabstractbackground And Aims: Pregnancy Is A Stressful Experience, Which Can Affectdifferent Aspects Of A Woman's Life. Yet, Women With A Supportive Netwo, Babol, Iran, République Islamique d'

Context: Pregnancy is a stressful experience, which can affect different aspects of a woman's life. Yet, women with a supportive network of friends and family may experience lower stress and improved self-care behavior.

Objectives: The study aimed to investigate the relationship between perceived stress and pregnancy distress with the self-care of pregnant women, as well as the mediating role of social support.

Methods: This cross-sectional study was conducted from February to May 2022 in Babol, Iran. A total of 157 pregnant women participated in the study. The participants completed five questionnaires, including a demographic and obstetric questionnaire, a Self-care questionnaire, Perceived Social support (PSS), Perceived Stress Inventory (PSI), and Pregnancy Specific Distress. Structural equation modeling was used to test the hypothesis relationships among the variables.

Results: We found that Perceived stress ($\beta = -0.221$, $p = 0.012\beta$) and pregnancy distress ($\beta = -0.203$, $p = 0.002\beta$) had a negative and significant effect on the self-care of pregnant women. Also, perceived stress ($\beta = -0.429$, $p < 0.001\beta$) and pregnancy distress ($\beta = -0.381$, $p < 0.001\beta$) had a negative and significant effect on the social support of pregnant women. The results exhibited a significant specific indirect effect between pregnancy distress, perceived stress, and pregnancy self-care, with social support as the mediator: standardized indirect effect = −0.068, −0.076, respectively.

Discussion: The results of this study showed that perceived stress, pregnancy distress, and impaired social support have a negative and significant effect on pregnant women's self-care, while social support played a mediating role

Conclusion: Therefore, providing strategies and measures to improve perceived social support by maternal health professionals may be expected to reduce the impact of stress on pregnant women's self-care. The implementation of policies and social interventions to improve the social support of pregnant women can be one of the applications of the findings.

ID 1380- Large scale implementation of a Decision Aid on Prenatal Screening: a stepped wedge cluster randomized controlled trial

France LEGARE [1] , Georgina DOFARA [1], Monica TALJAARD [2], Louis-Paul RIVEST [1], Team PEGASUS [3]

(1) Université Laval, Quebec, Canada
(2) Ottawa University, Ottawa, Canada
(3) Vitam, Quebec, Canada

Context: Decision aids (DA) are effective for engaging pregnant women in decisions about prenatal screening yet not implemented at scale.

Objectives: We evaluated the impact of scaling a DA about prenatal screening on the extent to which pregnant women were involved in the decision-making process.

Methods: We completed a pragmatic stepped-wedge cluster randomized controlled trial in the province of Quebec. We randomly assigned 32 clinics to four clusters of eight units. Eligible participants were all women in early pregnancy receiving prenatal care. Clinics changed practice from usual care (control period) to scaling of a DA (intervention period): delivering of paper based DA every 10 weeks, digital version of the DA, online training module for clinicians and monthly reminders. The primary outcome was the extent to which pregnant women were involved in the decision-making process about prenatal screening using SDM-Q9. We performed intention-to-treat. We used a linear mixed-effects model with clustering at the clinic level and adjusted for time. This trial is registered with ClinicalTrials.gov, NCT05859139.

Results: From July 2022 to January 2024, with follow up until July 2024, we enrolled 32 clinics with 886 pregnant women of whom 673 (76.0%) were included in the primary analysis (333 in the intervention group and 340 in the control group). Participants had a mean age of 31.5 years (SD 4.5), 70.3 % reported white ethnicity, 61.4 % university-educated and 86.3 % were Canadian citizen by birth. The adjusted mean difference in SDM-Q9 scores between the intervention and control groups was 4.22 (95% CI: -1.67 to 10.10).

Discussion: In clinical settings exposed to scaling of a DA compared to clinical settings not exposed to scaling of a DA, pregnant women were more involved in the decision-making process about prenatal screening but this was not statistically significant.

Conclusion: Scaling of a DA about prenatal screening showed a non-statistically significant increase in the extent to which pregnant women were involved in the decision-making process. Further research should identify what may cause a reduction of a DA effectiveness and effect size at the population-level during its scaling across multiple clinics.

ID 885- Impact of a Video-Based Lifestyle Modification Intervention on Quality of Life in Pregnancy: Results from a Randomized Controlled Trial

Ilgin IMIR, Vildan MEVSIM

Dokuz Eylul University, Faculty Of Medicine, Department Of Family medicine, Izmir, Türkiye

Context: Pregnancy is a critical life stage in which healthy lifestyle behaviors strongly influence maternal and fetal outcomes. Many pregnant women experience challenges such as low physical activity, suboptimal nutrition, and increased stress. Primary care offers the most accessible setting for lifestyle counseling; however, routine visits may provide limited time for comprehensive education. Video-based digital interventions offer a scalable, low-cost approach to support behavior change during pregnancy.

Objectives: The primary objective was to evaluate the effect of a video-based lifestyle modification intervention on pregnant women's quality of life. Secondary objectives were to assess its impact on healthy lifestyle behaviors and depressive symptoms.

Methods: This open-label, parallel-group randomized controlled trial enrolled pregnant women receiving routine antenatal care in primary care. Participants were randomly assigned (1:1) to intervention or control groups. The intervention group received a structured 12-week video-based lifestyle program beginning between gestational weeks 20 and 24, while the control group received standard antenatal care. Outcomes were assessed using the EQ-5D-3L for quality of life, the Health-Promoting Lifestyle Profile II (HPLP-II) for lifestyle

behaviors, and the Edinburgh Postnatal Depression Scale (EPDS) for depressive symptoms.

Results: The intervention group demonstrated a statistically significant improvement in EQ-5D-3L quality-of-life scores compared with controls ($p<0.05$). HPLP-II total and all subscale scores—including health responsibility, physical activity, nutrition, spiritual growth, interpersonal relations, and stress management—were significantly higher in the intervention group ($p<0.001$). EPDS scores decreased significantly, indicating reduced depressive symptoms.

Discussion: The intervention produced consistent behavioral and psychological benefits, supporting the feasibility of structured digital content in antenatal care. Strengthening lifestyle habits during pregnancy may promote healthier maternal weight gain, better birth outcomes, reduced postpartum complications, and improved early childhood development. Integrating scalable digital tools within primary care could enhance maternal–child health services and reduce disparities in access to lifestyle support.

Conclusion: A 12-week video-based lifestyle education program significantly improved quality of life, enhanced healthy lifestyle behaviors, and reduced depressive symptoms in pregnant women. Incorporating digital education into primary care antenatal services may offer a sustainable and accessible strategy to support maternal well-being. MeSH: Pregnancy, Quality of Life, Video-Based Education, Healthy Lifestyle, Depression

ID 680- Impact of monthly meetings between a family doctor and gynecologist on hospital appointments' referral rates: a descriptive cross-sectional study

Joana BAPTISTA ALVES [(1)] , Ana Francisca CARVALHO AZEVEDO [(2)], Liliana BARBOSA [(1)], Amparo EIRIZ MACIA [(2)]

(1) Usf Vimaranes, Uls Alto Ave, Guimarães, Portugal
(2) Usf Afonso Henriques, Uls Alto Ave, Guimarães, Portugal

Context: Primary health care (PHC) constitutes the first point of contact for patients within the national health service. Increasing waiting times for hospital appointments make collaboration between PHC and hospital care (HC) essential to ensure timely access and high-quality services.

Objectives: To evaluate the impact of monthly consultation meetings between a specialist in family medicine and a gynecology specialist on the number of referrals to hospital gynecology consultations from two family health units.

Methods: We conducted an observational, descriptive, cross-sectional study. The meetings were held monthly, lasted approximately one hour, and took place between October 2024 and July 2025. All cases discussed during the consultancy meetings within this period were analyzed. Data collected and reviewed included age, diagnosis, procedures performed, type of consultation, and the need for referral to hospital consultation.

Results: Eight meetings were held during the aforementioned period. Meetings scheduled for March and June 2025 did not occur due to scheduling conflicts between the specialists involved. A total of 69 cases were discussed, of which 16 patients were evaluated in face-to-face consultations. The mean age of patients was 48.4 years (minimum=15; maximum=79). The main themes discussed were the management of various gynecological symptoms (n=15, 22%); management of ultrasound abnormalities (n=12, 17%), namely fibroids; management of scheduling evaluation consultations after abnormalities detected in cervical cancer screening (n=10, 14%); and urinary incontinence (n=9, 13%). 18 referrals to hospital consultation were made (26%).

Discussion: The implementation of monthly consultancy meetings between specialists in family medicine and gynecology reduced the referrals to HC in 74%, proving to be an effective strategy for the management of clinical cases in PHC. Furthermore, these meetings promoted knowledge sharing,

continuous professional development, and strengthened coordination between levels of care, leading to improved quality of care provided to patients.

Conclusion: Joint discussion between family and gynecology specialists optimized diagnostic and therapeutic approaches, reducing unnecessary referrals to HC, demonstrating a positive impact on triage and the rational use of available resources. Thus, this collaborative model is a useful and replicable tool, contributing to greater efficiency within the health system.

Context: Smoking during pregnancy remains a significant public health concern due to its association with adverse maternal and neonatal outcomes.

Objectives: To analyse the sociodemographic characteristics and tobacco consumption patterns in the study population. To identify the relationship between smoking, mode of delivery, and gestational age.

Methods: This study is part of the TOBBGEST project, which evaluates the effectiveness of the TobbStop mobile application in reducing tobacco use among pregnant smokers. A multicentre randomised clinical trial and community-based intervention was conducted in Catalonia (Spain) between 2022 and 2025. Pregnant women under 28 weeks of gestation who were motivated to quit smoking were included. The control group (CG) received standard counselling, while the intervention group (IG) additionally accessed the TobbStop app. Main variables were mode of delivery and gestational age. Tobacco consumption data were collected during follow-up visits. Secondary variables included sociodemographic characteristics and lifestyle habits. Student's t-tests or Mann-Whitney U tests were used for continuous variables, and Pearson's chi-square for categorical variables.

Results: A total of 43 women participated (22 CG; 21 IG). No relevant differences were observed between groups in education level, household composition, or cultural context. The mean age of smoking initiation was 16 years, and more than half had previously attempted cessation; 90% had done so without pharmacological treatment. A total of 91% of the CG and 76% of the IG lived with smokers. Among pregnant women exposed to tobacco, 46.2% experienced dystocic deliveries. Those who smoked during the third trimester had a higher dystocic delivery rate (85.7%) compared with those who remained abstinent for more than 90 days (38.5%). Preterm births accounted for 20.9% of deliveries. No statistically significant differences were found between the CG and IG. *The sample will be expanded to 105 participants by the time of the conference.

Discussion: Findings align with evidence that continued smoking during pregnancy increases dystocic and preterm delivery risks. Although no statistically significant differences between groups were observed, trends suggest that earlier cessation may reduce obstetric complications.

Conclusion: Smoking during pregnancy increases the risk of dystocic and preterm delivery. Encouraging smoking cessation before the third trimester may reduce these risks.

ID 420- Adherence to various inhalers in adult asthma patients

Michal SHANI [1] , Doron COMANESHTER [2], Michael SEGEL [3]

(1) Department Of Family Medicine Gray Faculty Of Medicine, Tel Aviv University, Tel Aviv, Israël
(2) Clalit Health Service, Tel Aviv, Israël
(3) Dept. Of Medicine, Gray Faculty Of Medicine, Tel-Aviv University, Tel Aviv, Israël

Context: Inhalers containing bronchodilators and corticosteroids are the cornerstone of asthma therapy. Adherence to prescribed medication is critical to successful management.

Objectives: To study inhalers adherence in a large cohort of asthma patients, and to assess the effect of specific inhaler on adherence.

Methods: We performed a retrospective cohort study in Clalit Health Service (CHS), an HMO serving >50% of the population of Israel. CHS members aged 40-80 years with a diagnosis of asthma, who filled ≥1 prescription/year 2017-2019 (regular users) for at least one inhaler containing inhaled corticosteroids (ICS), long-acting beta-adrenergics (LABA), and/or long-acting anti-muscarinics (LAMA) were included. Filled monthly prescriptions were used as a proxy for actual medication use. The primary endpoint was the proportion of adherent users (purchase of ≥3 inhalers/yr in 2018).

Results: 45,801 asthma patients (age 68.4±7.1 yrs., 45% men, 40% ever smokers) were identified. 18,568 were regular inhaler purchasers (40% of total). 99% of the patients got inhalers containing steroids, and 93% got combination inhalers with both steroids and LABA. 95.7% used only one inhaler from the study inhalers. Adherence rate varied across inhalers, ranging from 51% to 77% for purchasing for at least 3 months. In multivariate analysis, adherence increased with age. Men and smokers were more likely to be adherent. Patients with good adherence were more likely to receive oral steroids (OR=1.09 [1.06, 1.12]) and less likely to visit the ER during 2018 (OR=0.89 [0.83, 0.97]). There was no difference in hospitalizations between more and less adherent patients.

Discussion: Adherence rates among asthma patients differ from those for other chronic medications.

Conclusion: Asthma adherence rates are low and vary with various inhalers.

Corresponding author: Michal Shani, michal.shani@gmail.com

ID 2048- Less Can Be More: The Impact of Polypharmacy on Quality of Life in Older Adults with Hypertension

Elifnaz TUNA, Yakup Batuhan TUNA, Yasemin ÖZKAYA, Bakiye Nurdan TEKGÜL, Umut GÖK

University Of Health Science İzmir City Hospital, İzmir, Türkiye

Context: Polypharmacy, the concurrent use of multiple medications, is increasingly common among older adults, particularly those with hypertension. While often necessary for managing comorbidities, it can reduce quality of life (QoL) due to adverse drug events, interactions, and treatment burden. Older adults are especially vulnerable due to age-related physiological changes, multiple chronic conditions, and increased susceptibility to side effects, making careful medication management essential.

Objectives: This review aims to synthesize current evidence on the impact of polypharmacy on QoL in older adults with hypertension and to discuss practical strategies for primary care.

Methods: A literature search was conducted in PubMed in December 2025 using the terms “polypharmacy,” “older adults,” “quality of life,” and “hypertension.” The search yielded 20 articles.The studies comprised observational cohorts, cross-sectional studies,systematic reviews,meta analyses and randomized controlled trials evaluating interventions such as deprescribing or medication optimization. Key information on medication burden, adverse effects, and quality of life was collected to provide a comprehensive overview of polypharmacy’s impact in older adults with hypertension.

Results: Most studies consistently demonstrated that polypharmacy is associated with lower QoL, affecting physical, mental, and social well-being. Increased risk of adverse drug reactions, hospitalizations, and healthcare utilization were common findings. Evidence suggests that structured medication reviews, pharmacist-led interventions, and patient-centered deprescribing can significantly improve QoL and reduce medication-related risks. Comorbidities and functional limitations amplify polypharmacy's negative impact. Shared decision-making and individualized care plans were highlighted as critical strategies for optimizing outcomes.

Discussion: Primary care providers play a central role in mitigating the effects of polypharmacy. Regular medication reviews, monitoring drug interactions, deprescribing unnecessary medications, and collaborative care with pharmacists and caregivers are critical for enhancing patient-centered outcomes. Awareness of the QoL implications of polypharmacy can guide treatment optimization and improve adherence.

Conclusion: Polypharmacy negatively affects QoL in older adults with hypertension. Targeted primary care interventions, including medication optimization and deprescribing, are vital to improve patient outcomes. Further research is needed to develop standardized protocols for polypharmacy management in this population.

ID 1995- A Study on Polypharmacy Prevalence and Primary Care Knowledge in Tirana, Albania

Artenca COLLAKU [(1)] , Llukan RRUMBULLAKU [(2)], Eno NACO [(3)], Ledio COLLAKU [(2)]

(1) Peace Corps Albania And Montenegro, Tirana, Albanie
(2) University Of Medicine Of Tirana, Tirana, Albanie
(3) Health Centre Nr4 Tirana, Tirana, Albanie

Context: The daily use of five or more medications is known as polypharmacy, and it is a growing public health concern among the elderly because it greatly raises the risk of adverse drug events, hospitalizations, and functional decline. To ensure safer prescribing in Albanian primary care settings, localized data on its prevalence and an awareness of PHC providers' viewpoints are crucial.

Objectives: To figure out the prevalence of polypharmacy among adults 70 years of age or older in the Tirana region, and to evaluate the attitudes and knowledge of PHC physicians regarding this clinical concept.

Methods: A cross-sectional study. With an estimated 9,227 people who are eligible, the study population includes registered adults in Tirana who are at least 70 years old, enrolled in a PHC facility. FP and phone contacts were used to recruit a representative sample of 400 participants. Standardized questionnaires, direct medical record review, and physician consultation serve to gather data regarding demographics, chronic conditions, and complete medication regimens. A different survey is utilized in a parallel arm to assess the primary care providers' knowledge and attitudes. Descriptive statistics will be utilized during statistical analysis to determine prevalence and describe provider's opinions.

Results: Since the study is still in progress, accurate numerical results are not yet available. Given the age and multimorbidity of the population, a quantified baseline prevalence rate of polypharmacy is anticipated to be significant. It is expected that the provider assessment will provide information about current knowledge and clinical procedures concerning the management of polypharmacy.

Discussion: The expected outcomes will benchmark the primary care workforce's capacity to handle polypharmacy and provide the first accurate information on its prevalence in a significant Albanian region. To improve medication safety, this will draw attention to a likely serious clinical problem and highlight any educational or systemic gaps that may need to be addressed.

Conclusion: This study is designed to determine the polypharmacy extent among the elderly Albanian population in Tirana and assess the preparedness of PHC physicians to handle it. The results are expected to highlight the significance of incorporating systematic medication review into geriatric care to improve patient safety and therapeutic outcomes.

ID 1596- Top ten most frequently prescribed oral medicines by general practitioners in XXXXX among adults, 2014 - 2023

Théo DUGUET

Sorbonne Universite, Paris, France

Context: Drug prescribing is a core component of patient management by general practitioners (GPs). No study has yet examined the most commonly prescribed medicines by GPs at the national level in France. However, simply counting dispensed boxes may bias interpretation by comparing small packages (e.g. paracetamol) with packages covering several months of treatment (e.g. antihypertensives). The use of the defined daily dose (DDD) concept enables homogeneous comparisons between drugs.

Objectives: To identify the ten most frequently prescribed oral medicines by GPs in adults between 2014 and 2023 in XXXX, expressed both as number of boxes and as DDDs.

Methods: We conducted a descriptive observational study from 2014 to 2023 using the XXXX national reimbursement database XXXXX. Oral treatments prescribed by GPs for adults were included, excluding medicines without a defined DDD. Quantities were expressed as numbers of boxes and as DDDs.

Results: By number of boxes, the most frequently prescribed medicines were paracetamol (47.4 boxes/person/year), acetylsalicylic acid (5.5 boxes/person/year), metformin (3.3 boxes/person/year), followed by amoxicillin, levothyroxine, bisoprolol, furosemide, alprazolam, omeprazole and esomeprazole. By DDDs, the most prescribed medicines were paracetamol (319.9 DDD/1000 persons/day), ramipril (281.8 DDD/1000 persons/day), atorvastatin (257.8 DDD/1000 persons/day), followed by furosemide, metformin, lercanidipine, amlodipine, perindopril, prednisolone and esomeprazole.

Discussion: This analysis highlights the major contribution of chronic treatments (cardiovascular disease, diabetes) to GP prescribing; in terms of DDDs, these conditions account for the vast majority of prescribed doses. In contrast, counting boxes captures, in addition to chronic treatments, the acute care dimension of general practice, illustrated by the presence of amoxicillin. Paracetamol ranks highly in both metrics. This dual approach provides a more comprehensive description of the spectrum of conditions managed in general practice. Nevertheless, DDD-based estimates have inherent limitations, and prescriptions that are not reimbursed or not dispensed are not captured in XXXX.

Conclusion: This study offers perspectives for medical education and for describing general practice activity to policymakers.

ID 1443- Using DECIdE (shared DECIsion in hEalth) for non-prescription drug decisions in primary care: a cluster randomised controlled trial

Elodie CHARUEL, Thibault MENINI, Hélène VAILLANT-ROUSSEL

Research Unit Acceppt Accompagnement Pluriprofessionnel Patient, Clermont-Ferrand, France

Context: Frequently used for symptomatic relief, nonprescription drugs (NPDs) accounted for over €2 billion in over-the-counter sales in France in 2023. Their often uncertain benefit-risk balance makes them a relevant context for shared decision-making (SDM) for general practitioners (GPs) and community pharmacists (CPs), who play a key role in supporting patients in their drug choices. DECIdE (shared DECIsion in hEalth) is a patient decision aid designed to provide access to trustworthy data and foster SDM on NPDs.

Objectives: To assess the effect of DECIdE on decisional conflict in primary care.

Methods: DECIdE was evaluated in a cluster-randomized controlled trial (RCT) comparing a control group (usual care) to an intervention group using DECIdE. Adults presenting with a symptom or a request related to a nonprescription drug were included. The primary endpoint was the Decisional Conflict Scale (DCS) score : a self-administered questionnaire consisting of 16 items rated on Likert scales covering information, values, support, uncertainty, and perception of the decision. The main analysis compared groups using mixed linear models accounting for the fixed effect of group allocation and the random effect of healthcare professionals.

Results: The RCT involved 24 GPs and 24 CPs (clusters) and included 200 patients. It did not show a significant difference in the DCS total score between groups. However, the proportion of patients with a high DCS (> 37.5%) was lower in the intervention group (4.3% vs 17.7%, p = 0.031) and the Information subscale score was reduced (p = 0.024). Healthcare professionals' DCS were also lower in the intervention group (14.5% vs 22.1%, p = 0.014 in the propensity score–weighted analysis).

Discussion: The main strength of this study is the combination of a rigorous cluster RCT design with real-world implementation in primary care, while the main limitation was the recruitment challenge in a strained healthcare access context. Its multi-professional approach appears to be unique in the literature on OAD assessments.

Conclusion: DECIdE is available through a dedicated website. It could contribute to a more appropriate and evidence-informed use of symptomatic medicines, particularly in the context of self-medication.

ID 922- Too many pills, too much risk: rethinking medication use in older adults

Giselle SARGANAS [(1)] , Dinara YESSIMOVA [(1)], Sydney ODONKOR [(2)], Stefan ZUTZ [(3)], Manja DANNENBERG [(3)], Lorena DINI [(2)]

(1) Department Of Epidemiology And Health Monitoring, Robert Koch Institute, Berlin, Allemagne
(2) Working Group Hpsri, Institute Of General Medicine, Charite Universitätsmedizin, Berlin, Allemagne
(3) Praxis M. Dannenberg U. St. Zutz, Neubukow, Allemagne

Context: Population aging leads to a higher prevalence of multimorbidity and polypharmacy among older adults in Europe. Potentially inappropriate medications (PIMs) and polypharmacy are linked to poor health outcomes including hospitalizations and reduced quality of life. To improve geriatric health outcomes in XXX, a rural region is implementing a pilot project, the XXX Interprofessional Outpatient Therapy for Geriatric Patients.

Objectives: To evaluate the effect of the medication review within the XXX programm on polypharmacy and PIM use and estimate potential upscaling, based on the results of the nationally representative Health of Older People in XXX study (XXX).

Methods: Participants aged ≥70 years in XXX are enrolled by their family doctor and randomized to standard care or to XXX—a multimodal intervention including a comprehensive physician-led medication review. Medication use is assessed by an independent study nurse at baseline, 4 and 8 months. PIMs are identified using XXX list. Prevalence of polypharmacy and PIM use are analysed for subgroups and modelled based on the results of XXX study.

Results: The XXX study found that 28% of older adults used at least one PIM and 59% had polypharmacy. Polypharmacy and PIM prevalence increased with age and was higher among people with lower education. 32% of PIM users were hospitalized in the last year compared to 21% of non-PIM users. The overall most frequently used PIM were pantoprazole or omeprazole (for a period longer than 3 months), ibuprofen (high dose for a period longer than 3 months) and ginko biloba leaf extract; however, the sequence changes according to sex, age group and income status. Analysis of medication use in XXX program is currently underway.

Discussion: Individual risk assessment of medication use in older adults must consider multimorbidity and socioeconomic vulnerability. Polypharmacy of prescribed medication reinforced by self-medication is strongly associated with PIM use, increasing hospitalization risk. Family doctors can play a crucial role in reducing PIM in older patients.

Conclusion: A comprehensive and regularly performed medication review in family practice can optimize medication in older adults, enhance safety and health outcomes.

ID 578- Approaches to managing hidden complexity in polypharmacy: Qualitative insights from GPs, pharmacists and patients

Jung Yin TSANG, Thomas BLAKEMAN, Matthew SPERRIN, Tomazo KALLIS, Rupert PAYNE, Darren ASHCROFT

University Of Manchester, Manchester, Royaume-Uni

Context: Polypharmacy, the use of multiple medications, offers benefits but can lead to negative outcomes like increased patient safety concerns, a poor patient experience, and wasted healthcare resources. Despite hundreds of studies on polypharmacy interventions, there is little evidence of these outcomes improving. There remains a gap in understanding the real-world experiences of how patients are identified for review, how consultations unfold and how effective those conversations are in addressing complex polypharmacy issues.

Objectives: To understand the everyday experiences of the identification and management of problematic polypharmacy from patient, pharmacist and GP perspectives, to identify potential opportunities for improvement.

Methods: Qualitative study incorporating semi-structured interviews of 12 patients and 12 professionals (5 General Practitioners and 7 clinical pharmacists) purposively recruited from 6 General Practices with variations in geography, deprivation, list size, and staff mix. Thematic analysis was informed by the Normalisation Process Theory (NPT) and Constant Comparison techniques.

Results: In practice, identifying and managing polypharmacy lacked focus with inconsistent case-finding. Dealing with polypharmacy exposed layers of complexity, compounded by complex multimorbidity, ambiguous messages from secondary care, challenging psychosocial issues, non-specific symptoms (e.g. fatigue, insomnia), and conflicting priorities between patients and practitioners. Patients viewed medications as essential tools to sustain biopsychosocial wellbeing, contrasting practitioners' clinical priorities to reduce potential harm. To highlight some of the breadth of approaches in managing this complexity, we grouped them into 4 main approaches for patients and professionals, employed according to differing levels of complexity. The 4 main approaches for professionals included: Protocol-driven approach; Prioritisation approach; Multidisciplinary approach; and Longitudinal follow-up approach. Likewise, patients also adopted 4 approaches including: Unquestioning acceptance; Outward acceptance; Proactively engagement; and Healthy confrontation

Discussion: Though 'Protocol-driven' approaches and 'Unquestioning acceptance' were the most efficient for simple medication queries, only a 'Longitudinal' follow-up approach, predicated on trust, continuity and building relationships over time, appeared to deal with deeper complexities within polypharmacy work.

Conclusion: Models of care to address problematic polypharmacy must go further and recognise the needs of both patients and practitioners in engaging with deeper complexity if we are to improve patient outcomes and achieve authentic shared decision-making.

(3) Department Of Thoracic Surgery, Demiroglu Bilim University, Istanbul Florence Nightingale Hospital, Istanbul, Türkiye

Context: Smoking cessation services face the challenge of vaping being perceived as “not smoking,” a misconception for which youth lungs pay the price and which drives EVALI (e-cigarette or vaping product use–associated lung injury).

Objectives: To map and synthesize the existing evidence on youth vaping–related EVALI with a primary care and family medicine perspective.

Methods: A scoping review following PRISMA-ScR guidelines used an AI-based platform to analyze recent, diverse evidence on EVALI. Searches in 3 database yielded 519 records, with 71 English-language studies from 2019 to 2025 included. These studies, comprising observational, clinical, epidemiological, review, and case series reports, focused on EVALI outcomes in adolescents and adults using e-cigarettes or vaping products. Study selection employed systematic Boolean search strategies, and results were synthesized descriptively and thematically.

Results: Publication numbers peaked in 2020 (n = 30) and 2021 (n = 17) before declining after 2022.The evidence base was largely driven by public health institutions, led by the Centers for Disease Control and Prevention (CDC) (n = 11), medicine (n = 7), and pediatrics (n = 7), while general practice was minimally represented (n = 1). The mean number of authors per publication was 8.03 ± 7.47 (IQR: 7), reflecting predominantly large, multi-author research teams.Thematic analysis identified eight major themes. The dominant theme was exposure to ENDS and vaping, including nicotine and THC/cannabis use and inhalational exposure to chemical constituents such as vitamin E acetate. Clinical presentation and disease severity ranged from acute lung injury and ARDS to hypoxia, ICU admission, prolonged hospitalization, and mortality. Diagnostic imaging frequently reported chest CT findings, particularly ground-glass opacities, with bronchoscopy and bronchoalveolar lavage used in selected cases. Additional themes included outbreak-driven epidemiology, adolescents and young adults as key risk groups, diagnostic overlap with COVID-19, psychosocial influences on vaping behaviors, and treatment strategies primarily based on supportive care and corticosteroids.

Discussion: EVALI represents a missed prevention opportunity rather than solely a tertiary-care diagnosis, highlighting the critical role of family medicine in early identification through routine vaping assessment in adolescents.

Conclusion: "Ask" smoking. "Advise" cessation. "Assess" clearly. Prevent EVALI in primary care.

ID 2179- Longevity and Primary Care Services: Current Evidence, Trends and Practice-Oriented Recommendations

Noémie LESTURGEON PIETRINI

Faculté De Médecine Jacques Lisfranc, Saint-Etienne, France

Context: Invasive pneumococcal infections, with mortality rates reaching up to 30%, are particularly severe in elderly with comorbidities people. Vaccination is essential but vaccination coverage remains low.

Objectives: The objectives of this study were to estimate pneumococcal vaccination coverage among at-risk adults for invasive pneumococcal infections in the XXX area following the new vaccination recommendations; to identify factors associated with vaccination; to assess knowledge about pneumococcus; and describe barriers and facilitators to vaccination.

Methods: This was a descriptive, cross-sectional, multicenter study conducted using questionnaires administered to patients attending five general practices in the XXX area.

Results: Of 300 questionnaires collected, 257 were analyzed. Vaccination coverage was estimated at 30.7% and significantly increased with risk level:

from 16.7% in adults aged 65 years and older without comorbidities to 43.8% for immunocompromised patients (p = 0.002). Patients with autoimmune or chronic inflammatory diseases were the best vaccinated (53.5%) and represented the only subgroup that showed a statistically significant association with vaccination (p < 0.001). Higher education levels and influenza vaccination were also associated with an increased likelihood of pneumococcal vaccination. Adequate knowledge about pneumococcus doubled this likelihood. The main barriers identified were lack of information (44.4%) and absence of a vaccine recommendation from a doctor (28.7%). Medical advice was the main facilitator (72.8%).

Discussion: The vaccination coverage in our study is higher than the national rate, this may be explained by the recent simplification of the vaccination schedule. In countries that were already vaccinating based on age criteria regardless of comorbidities, vaccination coverage among seniors is higher than elsewhere. As reported in the literature, vaccination coverage varies according to comorbidities. The level of knowledge regarding pneumococcus and vaccine is a major determinant of vaccination. Trust in the doctor is a key factor, the lack of knowledge about pneumococcus and patients' desire to be better informed, suggests a combined intervention targeting both patients and physicians.

Conclusion: Pneumococcal vaccination coverage remains insufficient in the XXX area, particularly among elderly patients without comorbidities, despite recent simplification of the vaccination schedule. Our results highlight the need to increase awareness among patients and physicians.
Keywords: pneumococcus, pneumococcal vaccination, vaccination coverage, adult, knowledge

ID 1960- Impact of preventive health check-ups on metabolic syndrome in overweight and obese adults: evidence from a multicenter longitudinal cohort

Jordan BIREBENT, Léa MOULY, Loïc BOUDEVILLE, Marion BERGEAUT

Dumg Toulouse, Toulouse, France

Context: Meningococcal B infections are rare but serious and mainly affect children under 1 year. In April 2022, in France, the High Authority of Health (HAS) recommended a vaccination for infants. Before, this vaccination wasn't in vaccination calendar and without reimboursement by collectivity.

Objectives: Our study aim to analyse the impact of HAS recommandation about the number of under 2 years children vaccinated. We also analyse the presribers speciality and social inequality before and after the HAS recommandation.

Methods: We made a descriptive, retrospective and quantitative study of meningococcal B vaccine delivered to children under 23 months of age included in our region from January 1st 2017 to December 31th 2024. This study was performed using a database from the National Health Data System.

Results: 180274 patients were included in our study. The number of patients who received a meningococcal B vaccine from 2017 to april 2021 (9051) increased from 0.29% to 3.96% of the population. For those under 12 months of age, the percentage increased from 0.11% to 6.34%. After april 2021, 171223 patients received this vaccination. The part of chilren vaccinated increased to 80% of the population. Prescribers were 80% pediatrics practionners before 2021, General Practitionners (GPs) became first prescribers after. The poputation with social dificulty increase from 2% to 21% after the HAS recommandation.

Discussion: We observed an increase in the delivery of meningococcal B vaccine to children under 2 years of age especially when the calendar change in 2022. Our study show that GPs are the first spéciality for precribi,g when the HAS change her recommandation. Social deprivation population have a better vaccination oppotunities after the HAS recommandation and GPs implication.

Conclusion: Our study show that HAS recommandation have a great impact on

vaccination coverage. GPs have a great importance for population prevention including in pediatric activity. GPs increase prevention in social precariousness population.

ID 248- The need to improve hypothyroid management pre-conception: the XXX protocol.

Hugo FIGONI, Emeline GRANGE, Kim BONELLO

Sorbonne Université, Paris, France

Context: Cervical cancer is the fourth most common cancer among women. It can be prevented through human papillomavirus (HPV) vaccination, available since 2006. Over the last twenty years, numerous studies have focused on the socioeconomic, demographic, and environmental factors associated with this vaccination. However, no study has described the evolution of vaccination prevalence concerning these different factors.

Objectives: To describe HPV vaccination coverage concerning individual and environmental socioeconomic and demographic factors associated with women eligible for this vaccination in high-income countries.

Methods: A systematic literature review analyzed the PubMed, Embase, WebOfScience, and Google Scholar databases. Included studies were published between 01/01/2006 and 03/14/2024. Their primary outcome was required to be the evaluation of vaccination coverage, and the secondary outcome the evaluation of associated socioeconomic, demographic, and environmental factors. Articles were selected after successive reading of titles, abstracts, and then full texts. Charts representing the evolution of vaccination prevalence were created when data permitted.

Results: 61 articles from twelve different countries were included. Overall vaccination coverage has increased over time. Differences in vaccination prevalence persisted over time, not only between countries but also within countries. Higher vaccination coverage was notably observed in young girls who were up-to-date with their other vaccinations, had recently consulted primary care, were born in the study country, had parents also born in the same country, and had a mother regularly participating in cervical cancer screening. Conversely, discordant results were highlighted across countries concerning household income level, socioeconomic status, parental education level, parental marital status, the deprivation index of the area of residence, and its degree of urbanization.

Discussion: Strengths include rigorous methodology and novel trend analysis; limitations involve data heterogeneity, and the observational nature of studies.

Conclusion: The WHO vaccination coverage targets for 2030 are still far from being reached, particularly in France. It appears essential to implement additional measures to promote vaccination and combat vaccine hesitancy to reduce the social gradient found in our study. Furthermore, it is imperative to learn from countries to achieve the highest vaccination coverage, such as Norway. The method of vaccine delivery within the school system could be beneficial if adopted by more countries.

ID 1752- Evaluation of an intervention dedicated to sexuality among vocational high school students.

Clarisse CHAMBARD, Kevin HERAULT, Karine GOURSAT

Chu Limoges, Limoges, France

Context: Human papillomavirus (HPV) is a virus that causes STIs and cervical cancer. The latest vaccinal recommendations call for young boys to be vaccinated, and in XXX, the coverage target of 80% in 2030 has not been achieved. We wanted to study the knowledge of young boys and their parents on this subject.

Objectives: The main objective was to assess the knowledge of young boys and their parents about HPV and vaccination in the XXX. The secondary objectives were to describe the sociodemographic

characteristics of the young boys and their parents and to search a link between these characteristics and the level of knowledge about HPV and vaccination.

Methods: This is a quantitative, observational, descriptive, multicenter study carried out in the XXX. Two different questionnaires were developed, one for boys and the other for their parent, which included three main sections: general socioeconomic information, questions about HPV, and HPV vaccination. We established a knowledge score based on the responses received. Questionnaires were sent to volunteer doctors, recruited by phone or direct contact. After completing the questionnaire, participants received a form with the answers.

Results: 104 boy/parent matched questionnaires were included in our study. There was a significant difference between the knowledge of young boys and their parents concerning HPV and vaccination. A very weakly positive and significant correlation was observed between the percentage of correct answers of young boys and their parents. Young boys' knowledge score about HPV and vaccination was significantly correlated with vaccine intentionality.

Discussion: Lack of knowledge on essential points. Parents' knowledge is better than that of young boys, who are the final decision-makers when it comes to vaccination. Our study has several strengths : a diversified perspective depending on the different types and locations of practice, a fairly large sample of target audience along with their close parent. The information sheet distributed at the end of each completed questionnaire allowed for the proposal of preventive measures.

Conclusion: Link established between the knowledge of young boys and their parents suggests the importance of prevention and the information provided about HPV and vaccination by GPs and other media.

ID 1377- Integrating Preventive Medicine into Chronic Disease Management

Erika KHUU [(1)] , Sohela MOUSSAOUI [(1)], Nicolas VIGNIER [(2)], Kim BONELLO [(1)], Elise ARCHER [(1)]

(1) Sorbonne Université, Paris, France
(2) Sorbonne Paris Nord, Paris, France

Context: Migrants experience persistent disparities in health access and outcomes, notably in immunization, due to vulnerabilities from interrupted vaccination in origin countries, inconsistent schedules, and marginalization within host systems. In Europe, they face challenges shaped by cultural, structural, and experiential factors that differ from native-born populations.

Objectives: This systematic review aimed to synthesize qualitative and quantitative evidence on vaccine hesitancy among migrant populations in Europe.

Methods: Eight databases (PubMed/MEDLINE, PsycINFO, EMBASE, Scopus, CINAHL, Web of Science, ERIC, and Cochrane Library) were searched for primary studies published in English or French between January 2000 and December 2024. References from relevant non-primary studies were hand-searched. This review followed Joanna Briggs Institute (JBI) methodology for mixed-methods systematic reviews. Eligible studies explored vaccine hesitancy among migrant populations in Europe. The quality of included studies was assessed using the Mixed Methods Appraisal Tool (MMAT). No studies were excluded based on quality, but MMAT scores informed interpretation. Data extraction used JBI's Mixed Methods Data Extraction Form, and synthesis followed a convergent integrated approach.

Results: Forty-six studies were included (20 qualitative and 26 quantitative). Evidence was synthesized under seven integrated findings: (1) acculturation, (2) distrust in authorities, (3) health literacy, (4) informal information networks, (5) sociocultural determinants, (6) sociodemographic characteristics and (7) vaccine-specific perceptions. No studies were excluded based on quality, but MMAT scores informed interpretation.

Discussion: This review shows that vaccine hesitancy among migrants reflects the combined influence of origin-country beliefs, host-country norms and migration experiences. Persistent cultural attitudes, context-dependent acculturation and regional differences shaped perceptions of risk

and safety. Gendered constraints, low health literacy and language barriers limited informed decision-making and encouraged reliance on informal and transnational networks where misinformation can spread. Institutional mistrust, rooted in repeated experiences of exclusion, further contributed to hesitancy.

Conclusion: Vaccine hesitancy among migrants arises from intersecting cultural, structural and migration-related factors that influence trust and information access. Community-led and culturally adapted strategies using trusted messengers show promise for improving confidence. Priorities for research include longitudinal and participatory designs, broader inclusion of understudied groups and examination of gendered dynamics and transnational information flows, along with evaluations of structural and policy interventions.

(1) Assimefac, Foggia, Italie
(2) Assimefac, Lecce, Italie
(3) Assimefac, Mattinata, Italie

Context: Prevention and treatment of addictions in the family medicine setting

Objectives: Alcohol consumption and binge drinking represent a public health problem. The study investigates young people's perception of the harm caused by alcohol consumption, evaluating correlations with binge drinking, and analyses prevalence, patterns, and related risky behaviors.

Methods: The study involved 106 young people, 59 males and 47 females, aged 18-30 (53.8% aged 25-30 and 46.2% aged 18-24). Participants were administered an anonymous multiple-choice questionnaire consisting of two parts: one examining habits, knowledge, and risk perception, and one regarding general information, following the AUDIT questionnaire, sponsored and recommended by the World Health Organization (WHO). The main alcohol-related risk behaviors analyzed were: drunkorexia, drunk driving, alcohol-related road accidents, and episodes of violence/self-harm.

Results: The survey highlighted high alcohol consumption, which has spread through binge drinking. Most young people demonstrate a lack of awareness of the risks associated with alcohol consumption, persisting in risky behaviors such as drunk driving.

Discussion: Despite European and WHO policies and a decline in the incidence among young people, the early onset of alcohol consumption increases the risk of abuse and dependence, with physical and behavioral consequences.

Conclusion: The results suggest the need to increase awareness of alcohol-related problems adopting prevention strategies.

Primary care resilience

ID 2219- Primary Health Care in the Shadow of War

Selma KAYA [(1)] , Nagihan YILDIZ ÇELTEK [(1)], Nebahat Bilge BALIM [(2)], Hatice Belkıs BULUT [(3)]

(1) Tokat Gaziosmanpaşa University, Tokat, Türkiye
(2) Süleyman Demirel University, Isparta, Türkiye
(3) İstanbul Bakırköy Dr Sadi Konuk Education And Research Hospital, İstanbul, Türkiye

Context: Armed conflicts disrupt health systems not only through acute injuries but also by limiting access to routine and preventive health services. Vulnerable populations, especially those with chronic conditions and mental health needs, are affected first. Despite this, war-related health literature largely focuses on emergency response and hospital-based care, while the role of family medicine and primary health care (PHC) under prolonged conflict conditions remains less explored. In many settings, family doctors continue to provide first-contact and longitudinal care within their

communities. This issue is particularly relevant for countries such as Turkey due to their geographical proximity and humanitarian engagement with conflict-affected regions.

Objectives: This review aims to synthesise recent evidence on the functioning of family medicine and PHC services in armed conflict settings, focusing on equitable access to care, safety and freedom for health workers and patients, and solidarity mechanisms supporting service continuity.

Methods: A literature search was conducted in November 2025 using PubMed, Scopus, and Google Scholar. Search terms related to family medicine ("family physician", "family doctor", "general practitioner", "primary health care") were combined with war- and conflict-related keywords. Studies published within the last five years were included. Of 405 records identified, 16 studies addressing community-based primary care or family medicine roles in conflict settings met the inclusion criteria. Studies focusing exclusively on hospital-based care were excluded.

Results: The included studies reported widespread disruptions in preventive services and chronic disease management. Continuity of care for non-communicable diseases, particularly diabetes and hypertension, declined in most settings. In contrast, core PHC services such as antenatal care, childhood immunisation, and basic emergency obstetric care were relatively prioritised through family medicine-based structures. Mental health needs, including anxiety, depression, and post-traumatic stress disorder, increased substantially and were often addressed at the primary care level. Telemedicine, mobile clinics, and task shifting to community health workers were commonly used to support service delivery.

Discussion: Family doctors frequently assumed expanded roles beyond clinical care, including psychosocial support, coordination of limited resources, and maintaining trust within affected communities.

Conclusion: Family medicine plays a central yet often overlooked role in sustaining essential health services and supporting health system resilience during armed conflict.

ID 2170- Resident-led crisis staffing: a historical study of a rapid medical reinforcement mobilisation system

Frédérick MONIN

Ufr Santé/université De La Réunion, Saint-Denis, Réunion

Context: During the first COVID-19 wave, health systems faced uncertainty and the need for rapid medical staffing reinforcement. In several settings, junior doctors' representatives initiated mobilisation initiatives. Understanding how residents can take leadership and build an operational reinforcement system may inform preparedness for future crises.

Objectives: To describe the step-by-step construction of a resident-led medical reinforcement mobilisation system during the first COVID-19 wave, and to document its operational deployment.

Methods: Historical approach using contemporaneous heterogeneous sources available during decision-making (11 March–10 May 2020). The corpus included selected email threads and attachments, local/national communications, successive versions of the mobilisation procedure, protocols in use, and digital tools used for monitoring the epidemic and mobilisation. Sources were analysed to reconstruct chronological sequences of the system's construction, model the procedure, and quantify mobilisation.

Results: Five chronological sequences were identified: (1) awareness of anticipated staffing needs, (2) collegial definition of mobilisation criteria, (3) creation of a volunteer pool using an online questionnaire, (4) definition of mobilisation rules and authorisation workflow with institutional actors, and (5) consolidation during implementation through shared digital tracking tools. The system highlighted residents' leadership in proposing rapid, simple solutions based on digital tools and ground-level coordination. Quantitatively, 217 volunteers responded to the mobilisation questionnaire; 130 residents were identified as immediately mobilisable, and 47 residents were effectively redeployed through the procedure.

Discussion: This resident-led, digitally supported process illustrates how junior doctors can contribute to crisis governance and rapid operational coordination when formal staffing pathways are constrained. It also raises questions about the distribution of decision-making and the integration of "bottom-up" initiatives within centralised crisis management.

Conclusion: A resident-led mobilisation system, co-constructed with institutional stakeholders and supported by simple digital tools, can rapidly structure medical reinforcement during a crisis and provides a reproducible model for future emergency preparedness.

ID 2001- In-situ simulation as a system test to improve quality and safety in primary care

Zalika KLEMENC-KETIŠ, Uroš ZAFOŠNIK

Ljubljana Community Health Centre, Ljubljana, Slovénie

Context: Life-threatening emergencies in primary care are infrequent but require rapid, coordinated action across professional and organisational boundaries. Traditional training approaches primarily focus on individual competencies and may overlook system-level weaknesses. In-situ simulation offers a method for testing real-world emergency readiness within everyday clinical environments.

Objectives: This study aimed to assess emergency response readiness, team coordination, and latent safety threats in primary care using interdisciplinary in-situ simulation.

Methods: Interdisciplinary in-situ simulations were conducted across all units of a large urban community health centre in 2025. Scenarios included adult and infant cardiac arrest, as well as outpatient triage, performed in real-world clinical settings such as dental clinics, laboratories, and general outpatient areas. Primary outcomes were the emergency response team's arrival time and adherence to critical resuscitation steps; secondary outcomes focused on identifying organisational and environmental safety threats.

Results: Emergency response teams consistently arrived within the predefined target of 120 seconds. The mean response time was 50.8 ± 24.2 seconds, demonstrating rapid activation across diverse primary care settings. In-situ simulation revealed recurrent latent safety threats, including spatial limitations, delayed access to emergency equipment, and variable familiarity with emergency protocols, particularly in non-traditional clinical environments.

Discussion: The findings suggest that in-situ simulation serves not only as an educational tool but as a practical system test for primary care organisations. While response times met established benchmarks, simulations exposed context-specific vulnerabilities that are unlikely to be identified through off-site or classroom-based training. Interdisciplinary participation proved essential, as emergencies frequently occurred in settings where staff are not routinely exposed to acute care scenarios. By revealing organisational, spatial, and procedural gaps, in-situ simulation enables targeted quality and safety interventions tailored to local practice realities.

Conclusion: In-situ simulation offers a feasible and practical approach to assessing emergency preparedness and enhancing quality and safety in primary care. Embedding this method into routine quality improvement processes may strengthen system resilience beyond the acquisition of individual skills.

ID 1391- The role of general practitioners in responding to a chikungunya virus (CHIKV) outbreak in southern France, 2025

Matthieu DESCHAMPS [(1)] , Albin FONTAINE [(2)], Laura PEZZI [(2)], Xavier DE LAMBALLERIE [(2)]

(1) Département Universitaire De Médecine Générale (dumg), Aix-Marseille University, Marseille, France
(2) Unité Des Virus Émergents (uve, Aix-Marseille University, Università Di Corsica, Ird 190, Inserm 1207,

Irba), 19-21 Bd Jean Moulin, 13005 Marseille, France, Marseille, France

Context: Between August and October 2025, a mosquito-borne chikungunya virus (CHIKV) outbreak occurred in XXX (XXX XXX), with 18 confirmed cases. In response, local general practitioners (GPs) were mobilized to support the identification of suspected cases and raise awareness among patients regarding symptoms and indications for medical care. In parallel, a participatory science initiative was conducted in collaboration with Unité des Virus Emergents (UVE, XXX), supported by local authorities.

Objectives: The project aimed to assess the extent of viral circulation in the city by engaging volunteers, recruited throught their GP, and equipped with household mosquito traps.

Methods: A prospective epidemiological study was conducted in which participants brought collected mosquitoes to their GP's practice. Samples were then tested at UVE for CHIKV detection. All participants received individualized feedback regarding CHIKV detection in mosquitoes collected from their homes, along with targeted recommendations for mosquito-bite prevention and infection risk reduction.

Results: GPs were sensitized to existing clinical recognition tools and weekly updates from health authorities on ongoing CHIKV circulation. During routine consultations, patients were sensitized to ensure early identification of suspected cases, with particular attention given to individuals at higher risk of severe disease. Through GP surveillance, 10 symptomatic patients were identified and confirmed positive for CHIKV by laboratory testing. The participatory science project generated mosquito collections from 33 households and additional public areas, yielding more than 2,500 mosquitoes. CHIKV was detected in one area where human cases had previously been reported. The concerned participant was promptly informed, and vector-control interventions were reinforced due to concurrent virus detection in both mosquitoes and humans.

Discussion: This initiative illustrates how primary care can significantly enhance the response to outbreaks in areas with established mosquitoes. GPs contributed to early case detection, dissemination of accurate health information, and promotion of preventive behaviors. Their close connection to the community facilitated rapid engagement in the participatory science project, generating actionable entomological evidence data supporting timely vector-control measures.

Conclusion: This experience highlights the pivotal role of GPs in detecting and mitigating a CHIKV outbreak in France. Sustained collaboration between clinicians, public health agencies, and research institutions should be promoted to enhance preparedness for future arboviral threats.

ID 1395- Role of the family physician in supporting mental health during wartime: challenges and practical solutions

Taras GRIADIL

Uzhhorod National University, Uzhhorod, Ukraine

Context: The full-scale war in Ukraine has produced a steep rise in population mental-health needs and massive internal and external displacement, straining specialist services and placing primary care at the frontline of psychosocial support. Recent national and international assessments report high burdens of depression, anxiety and PTSD among civilians and internally displaced persons (IDPs).

Objectives: To synthesize evidence from Scopus and Web of Science indexed literature and national reports, to reflect on practice-based experiences from Ukrainian primary care, and to propose pragmatic, scalable interventions family physicians can implement to identify, manage, and refer patients with war-related mental health problems.

Methods: I conducted a focused narrative review of peer-reviewed studies (2019–2025) indexed in Scopus and Web of Science, supplemented with WHO country data and national Ministry of Health reports, and combined these findings with practice-based reflections and a short illustrative case from a primary-care clinic in Ukraine. The 2019 WHO STEPS survey is used as baseline population health data but is contrasted with post-2022 evidence due to massive population displacement and changed risk profiles.

Results: Data taken from population health surveys (WHO STEPS 2019) document important baseline NCD and mental-health risk factors but do not reflect wartime displacement and trauma exposure. Contemporary studies and health-needs assessments indicate that ~1 in 3 adults report symptoms consistent with a mental-health disorder since the 2022 escalation, with even higher rates among IDPs (depression/PTSD estimates frequently >30–50%). Service-level reports highlight expanded primary-care mental-health packages and mhGAP-based training, but coverage and workforce shortages remain critical.

Discussion: I recommend (1) systematized screening in primary care using brief validated tools; (2) stepped care with low-intensity psychosocial interventions delivered by trained family physicians/nurses; (3) clear referral pathways to specialist MHPSS (mental health and psychosocial support); (4) integration of telemedicine for displaced populations; and (5) workforce support and rapid training roll-out (mhGAP, brief CBT skills).

Conclusion: Family physicians play a key role in conducting screening, identifying mental health disorders, and providing appropriate interventions during wartime. Rapid adaptation of clinical workflows, targeted workforce training, and strengthening of referral pathways are realistic priorities for reducing the mental-health care gap in conflict settings.

ID 565- Scaling simulated clinical stations to strengthen patient safety and emergency preparedness in primary care teams

Anna ANDRES LORCA, Sonia MARTIN MARTIN, Elisabet DESCALS SINGLA, Jordi SERRABOGUÑA BRET, Marta MILLAN FERNANDEZ, Ermengol COMA REDON, Sara RODOREDA NOGUEROLA, Eduardo HERMOSILLA PEREZ

Institut Català De La Salut, Barcelona, Espagne

Context: Simulation-based education is increasingly recognized as a key strategy to promote patient safety and improve the management of emergencies within Primary Care Teams (PCT). The Catalan Health Institute (ICS) implemented a large-scale programme of Simulated Clinical Stations to enhance competencies in urgent and high-risk situations across 186 primary care teams in Catalonia. This study evaluates the programme's educational impact in terms of knowledge acquisition and professional satisfaction.

Methods: A prospective pre–post observational study including 8,916 professionals (physicians, nurses, administrative staff) was conducted at the CAP Balmes simulation centre. Participants completed nine standardized simulated stations using trained actors and structured checklists. Knowledge was assessed through pre/post tests (0–10 scale), and satisfaction through a 76-item Likert scale questionnaire (0–6). Data were collected anonymously. Statistical analyses involved independent t-tests and effect size estimation.

Originality: the objective is to assess the effectiveness of a multi-station simulation programme in improving (1) knowledge related to critical emergency codes (sepsis, stroke, AMI, suicide risk, CPR/BLS) and (2) perceived usefulness and satisfaction among multidisci

Lessons learned and future implication: Globally, mean knowledge scores increased from 5.1/10 to 7.6/10 (+49%, $p < 0.001$; effect size $d = 1.2$). Improvements were consistent across all scenarios: • Sepsis Code: +83% • Suicide Code: +74% • AMI/Stroke: +36% • BLS/CPR: +29%

Discussion: This large-scale intervention demonstrates that structured simulation with standardized scenarios and trained actors is feasible, impactful, and transferable across diverse primary care settings. Beyond clinical competence, the programme strengthens teamwork, communication, and ethical decision-making in complex cases, including chronic care situations with shared decision preferences (e.g., PIIC No-RCP scenarios).

Conclusion: Simulated Clinical Stations are a scalable and high-value educational strategy that significantly improve emergency preparedness and patient-safety competencies in primary care. Their multidisciplinary, immersive and reproducible format offers a robust model for other healthcare systems seeking to enhance workforce readiness and quality of care.

ID 90- Resilient at the Frontline: Strengthening Local Health Systems and Primary Care under Crisis in Southern Thailand

Orawan TAWAYTIBHONGS [(1)] , Chaisiri ANGKURAWARANON [(2)], Joris MICHIELSEN [(3)]

(1) Ministry Of Public Health, Nonthaburi, Thaïlande
(2) Research Institute For Health Sciences, Chiang Mai University, Chiang Mai, Thaïlande
(3) Institute Of Tropical Medicine, Antwerp, Belgique

Context: Thailand's deep southern provinces have experienced recurring shocks from public health emergencies, natural disasters, and prolonged sociopolitical instability. Strengthening local health system resilience is essential to maintain essential services and protect vulnerable populations. This study explored how local health actors—across public, private, and community sectors—demonstrated absorptive, adaptive, and transformative capacities within a decentralized health governance framework.

Objectives: The primary objective was to examine the processes and enablers of local health system resilience in southern Thailand. The secondary objectives were (1) to assess governance and leadership mechanisms facilitating cross-sector coordination, and (2) to identify community and innovation strategies that strengthened primary care resilience during crises.

Methods: A qualitative case study was conducted in a district hospital in the deep south of Thailand. Thirty-seven participants were purposively selected, including health professionals, public health officers, family physicians, nurses, non-communicable disease (NCD) patients, village health volunteers (VHVs), community and religious leaders, local government representatives, and private partners. Inclusion criteria included the ability to communicate in Thai and willingness to participate with informed consent. Exclusion criteria were inability to communicate in Thai, unwillingness to participate, or non-residency based on census records. Data were collected through in-depth interviews and document review, and analyzed thematically using a resilience framework emphasizing absorptive, adaptive, and transformative capacities.

Results: Eight themes emerged: (1) preparedness and planning through early emergency operations and local resource mobilization; (2) strong governance linking hospitals, local governments, and communities; (3) dedicated workforce resilience despite burnout; (4) community-led logistics mitigating supply shortages; (5) digital platforms supporting communication and teleconsultation; (6) flexible service delivery ensuring care for fragile populations; (7) community participation driving shared ownership of health initiatives; and (8) psychological support fostering solidarity and compassion. These mechanisms collectively enhanced system functionality under crisis.

Discussion: Resilience in Thailand's local health systems is both institutional and social—rooted in trust, collaboration, and community participation. Digital innovation and faith-based solidarity supported rapid adaptation and sustained service delivery.

Conclusion: Synergistic governance, community engagement, and adaptive innovation underpin local health system resilience. Strengthening these elements is vital for building people-centred, resilient primary health care and advancing universal health coverage in fragile contexts.

ID 1700- Building the Foundations of Primary Care: Expert Recommendations for Quebec's First Government Policy

Mylaine BRETON [(1)] , Catherine LAMOUREUX-LAMARCHE [(1)], Elise BOULANGER [(2)], Marie-Dominique BEAULIEU [(3)], Karina PRÉVOST [(1)], Catherine BOUFFARD-DUMAIS [(4)], Sophie BOIES [(1)], Antoine GROULX [(1)]

(1) Université De Sherbrooke, Longueuil, Canada
(2) Université Mcgill, Montréal, Canada
(3) Université De Montréal, Montréal, Canada
(4) Université Laval, Québec, Canada

Context: Primary care (PC) is widely recognized as the foundation of effective and equitable health systems. In Quebec, access to a regular source of PC remains a major challenge.. In this context, the Quebec government initiated the development of its first provincial PC policy and mandated an independent expert committee to formulate evidence-informed recommendations.

Objectives: The objective is to synthesize the committee's work and outlines a pragmatic roadmap to strengthen PC in Quebec.

Methods: The mandate was conducted over four months using three sequential components integrating scientific and experiential knowledge: 1) a targeted review of literature and policy syntheses and a jurisdictional analysis of six countries (United Kingdom, Sweden, Netherlands, Norway, France, Canada) and three provinces (Ontario, Alberta, Quebec); 2) 59 semi-structured consultations with more than 210 participants across Quebec and 3) an in-person forum with 135 participants to enrich preliminary recommendations. The final recommendations were developed during a two-day meeting, aligned with Quebec system values and the quintuple aim.

Results: Evidence synthesis emphasized that no single "best" PC model exists; performance depends on coherent system configurations adapted to context. Nevertheless, international consensus converges on several core features: a clear policy vision, financing aligned with health objectives, governance structures linked to communities, formal attachment to reinforce continuity and accountability, interprofessional teams, and strong coordination across services. Findings from the consultations revealed a fragmented, hospital-centered system characterized by inequitable access and insufficient continuity, while existing performance indicators were perceived as volume-focused and insufficiently oriented to quality and value. The committee proposed six recommendations: (1) a comprehensive PC workforce development strategy; (2) universal patient registration within interprofessional teams; (3) strengthened local governance; (4) sustained investment in research and data infrastructure; (5) dedicated and protected public funding for PC; and (6) population-level performance measurement focused on outcomes important to patients.

Discussion: The Quebec's first government PC policy can serve as a strategic lever to address the PC crisis if reforms are implemented as a coherent package rather than selectively.

Conclusion: Achieving the proposed vision requires a concrete, phased action plan, and long-term investments in teams, governance, financing, and data infrastructure.

ID 715- Using Established World Health Organization protocols to reduce cost and improve health outcomes in Eastern Europe

Daniel RICKS [(1)] , Robert BATES [(2)], Jane RICKS [(1)]

(1) Independant Researcher, Salt Lake City, États-Unis
(2) Brigham Young University, Provo, États-Unis

Context: Globally, over 7 billion people are at risk for not receiving adequate health care. As a country becomes more developed, the causes of morbidity and mortality change. This is called epidemiologic transition. To help countries in epidemiologic transition, the World Health Organization (WHO) has created early diagnosis and management protocols, called "Package of Essential NCD Interventions" (PEN). PENs are designed to help this transition from communicable diseases to non-communicable diseases (NCD)s, and to be less labor-intensive and more affordable than developed world standards.

Objectives: The objective is to discuss PEN implementations in Eastern Europe, their outcomes, and implications for further healthcare improvement.

Methods: European countries were stratified according to an adapted five-stage model of epidemiological transition aligned with WHO priorities. Published data were reviewed to identify sites across Europe where PEN protocols were implemented. A literature search was done to look for outcomes data from these programs.

Results: At least 5 countries have implemented PENs, Kyrgyzstan, Moldova, Tajikistan, Ukraine, and Uzbekistan. Published results are available from Moldova, Tajikistan, and Ukraine. Sample **Results:** Moldova showed cost-effectiveness, Tajikistan improved hypertension (HTN) control, and statin prescribing, and Ukraine showed improved HTN control and decreased reliance on donor funding. Other findings will be presented.

Discussion: Most countries are facing high morbidity and mortality from NCDs. PENs are proving to be effective in improving health in a cost-effective manner in Eastern Europe. Similar findings are seen in countries such as Costa Rica, Thailand, and Viet Nam, with dramatic improvements in their management of NCDs and improvement of life expectancy with PEN implementation. We believe similar outcomes can be achieved with the implementation of PENs both locally and throughout entire countries.

Conclusion: The countries who have implemented PENs have uniformly had positive results both in improving health care and/or in creating cost savings. This shows that more widespread implementation of PENs may be useful to improving health care in Eastern Europe and throughout the world. Since health dollars are limited, wise use of these funds is warranted. PENs are one cost-effective method for health improvements in developing countries.

ID 1138- Towards a Sustainable Future in Primary Care: First Results from a National Implementation Project

Jan JANSEN, Jessica MERKX

Dutch College Of General Practitioners, Utrecht, Pays-Bas

Context: Healthcare significantly contributes to climate change, which poses a major threat to public health. Previous initiatives have introduced tools and guidelines to reduce the environmental footprint of general practice. Building on this foundation, a national implementation project was launched to prioritize sustainable goals in primary care. Which mitigation measures have the greatest impact on climate change?

Methods: The project, funded by the Dutch Ministry of Health, involves several stakeholders. Two sub-projects were prioritized: (1) A scientific impact analysis of GP care, including a literature review of life cycle assessments and expert consultation to identify ten high-potential mitigation actions. (2) Development of a national roadmap for sustainable GP care, integrating existing initiatives and aligning with the Green Deal Sustainable Healthcare 3.0.

Originality: Across Europe, healthcare systems are adopting sustainability strategies to cut emissions and waste. Initiatives include national decarbonisation roadmaps, circular procurement, and eco-design for medical devices. Supported by the EU Green Deal and Horizo

Lessons learned and future implication: The impact analysis revealed environmental hotspots in prescribing, diagnostics, and practice management. Ten mitigation actions were evaluated for feasibility and potential climate impact. The roadmap outlines a phased transition strategy for Primary car

Discussion: Within the Sustainable Development Goals, gains can be achieved in primary care. For some Green Deal objectives, such as health promotion, the environmental impact is difficult to quantify, but it also is important to consider these in the analyses.

Conclusion: Sustainable GP care is achievable through targeted actions and coordinated implementation. These first results provide a foundation for scaling up and embedding sustainability in clinical practice. Primary care can play a leading role in planetary health.

Corresponding author: Jessica Merkx, j.merkx@nhg.org

ID 621- Major funding and policy change in XXXX general practice

Michael WRIGHT

Unsw/racgp, Sydney, Australie

Context: XXXX is currently undergoing major primary care reform including shifts in funding and organisational structure general practice. This presentation will outline recent policy changes and their impact on the availability and financial viability of high-quality general practice services

Objectives: To outline changing nature of general practice consultations To outline recent policy changes and the impacts on the delivery of high-quality primary care.

Methods: Quantitative data analysis of health utilisation statistics, and results from a survey of 2416 general practitioners (GPs) commissioned by the national GP college/assocation

Results: Psychological/mental health conditions rank highest of commonly treated conditions, followed by women's health and endocrine conditions. Average consuttation length has increased to 20 minutes, and is nearly 22 minutes for female GPs, 57% of GPs work in multidisciplinary teams, with 2/3 of GPs wanting to provide more multidiscipllinary teams but report time and inadequate remuneration as barriers. More than 80% of GPs report providing care which was preveiously referred to other medical specialists. Since 2014 the percentage of Health funding allocated to comprehensive primary care is decreasing, reflecting both static general practice investment and increasing costs of hospital care.

Discussion: General practice care is becoming more complex and GPs are managing more care in the community. Current funding models provide greatest reward for short consultations. There is an increasing need for funding to support more preventative care and multidisciplinary teams based care.

Conclusion: These results indicate growing complexity in general practice consultations reflecting population ageing and increasing multimorbidity. Current financial incentives are greatest for short and simple consultations. Incentive redesign is needed to better support patients requiring complex care, and the primary care workforce delivering this care.

ID 1038- "Beyond the Blueprint: Thailand's Primary Health System Act 2019 and the Realities of PHC Governance on the Ground."

Orawan TAWAYTIBHONGS

Division Of Primary Care Support, Ministry Of Public Health, Nonthaburi, Thaïlande

Context: Thailand's primary healthcare (PHC) system, crucial for universal coverage, faces intense pressures: resource scarcity, aging populations, rising non-communicable diseases, and workforce burnout. The 2019 Primary Health System Act aimed to reshape governance. This presentation explores the dynamic interplay between national policies and local realities.

Methods: Our mixed-methods study primarily employed a qualitative case study. We analyzed the 2019 Act and related policies, alongside semi-structured interviews with policymakers, health administrators, and community representatives across national, subnational, and local levels, yielding granular implementation insights.

Originality: This research offers a unique multi-scalar analysis of Thai PHC governance. Beyond broad decentralization, we investigate how the Primary Health System Act 2019 is implemented in practice amid resource scarcity and changing demographics, specifically exam

Lessons learned and future implication: Lessons highlight the integration of innovative solutions, such as enhanced supportive supervision and self-care promotion, to build workforce resilience. Adaptable governance that addresses

transport infrastructure and professional development is vital f

Discussion: Thailand's challenges—resource scarcity, workforce burnout, and demographic shifts—mirror global concerns about the sustainability and equity of the health system. This necessitates comprehensive policy re-evaluation. The discussion connects findings to broader international efforts, emphasizing integrated, preventative care models and robust governance for sustainable outcomes.

Conclusion: Urgent, comprehensive reforms are paramount for Thailand's PHC. Success hinges on the 2019 Act bridging national mandates with local realities. This strategic shift towards integrated, preventative care, supported by resilient infrastructure and a motivated workforce, is crucial for equitable and sustainable health for all citizens.

ID 558- Primary Health Care Models: A Comparative Analysis in EU Countries

Sabine MORA-MIEZE, Laura KLINTSONE, Liena GASINA, Ilze GROPE

Rigas Stradins University, Riga, Lettonie

Context: Primary health care (PHC) systems within the European Union (EU) vary considerably in governance, financing, workforce structure, accessibility, and digital/infrastructural resources. Understanding these differences is essential for strengthening PHC performance and guiding effective policy development. Finland, Slovakia, Estonia, Lithuania, and Latvia represent diverse PHC approaches shaped by diverse historical, economic, and organisational contexts.

Objectives: To analyse PHC models across Finland, Slovakia, Estonia, Lithuania, and Latvia, assessing how differences in governance, financing, workforce organisation, accessibility, and system resources correspond to variations in health outcomes.

Methods: A comparative cross-sectional analysis was conducted using OECD Health Statistics 2023, WHO European Health Information Gateway, and national health system reports from 2015–2024. Indicators included general practitioner (GP) density, workforce metrics, service accessibility, digital/infrastructure availability, chronic disease management, and avoidable hospitalisations. Qualitative analysis examined PHC organisation, gatekeeping, digital integration, and community-based care. Findings synthesised quantitative trends with policy contexts.

Results: Finland and Estonia demonstrate strong gatekeeping, clearer PHC entry points, and a predominance of group or integrated practices. Lithuania combines capitation-based financing with growing community care integration, while Latvia and Slovakia use mixed financing and feature more solo practices. Higher GP density in Finland, Estonia, and Lithuania is associated with better access and continuity of care. Estonia has the most advanced digital PHC infrastructure, followed by Finland and Lithuania. Avoidable hospitalisations are higher in Latvia and Slovakia.

Discussion: Despite shared EU policy frameworks, substantial differences remain in PHC organisation and performance. PHC models with strong gatekeeping, stable financing structures, group practices, and integrated community services achieve greater efficiency and improved outcomes. Solo practice dominance, limited integration, and underdeveloped digital systems in Latvia and Slovakia contribute to higher avoidable hospitalisations. Variations in financing and workforce shortages affect accessibility and continuity of care.

Conclusion: PHC systems that combine strong gatekeeping, group or integrated practices, and reliable digital and community-based services achieve better accessibility, continuity, and chronic disease outcomes. Strengthening these features—particularly in countries relying on solo practices or mixed financing—can enhance efficiency and reduce avoidable hospitalisations. Further research should focus on longitudinal evaluation of PHC reforms and opportunities for cross-country learning.

Primary healthcare bricks & builders

ID 1926- Optimizing Clinical Documentation in Primary Care: Leadership, Advocacy, and Health Systems Strengthening

Ernest EKEZIE [(1)] , Dikmen EKIN [(2)], Asiedu ANDREA [(1)], Klutse MAKAFUI [(1)], Khan UMBER [(3)], Melbaliz VELEZ-AFANADOR [(1)], Abiodun OTOLORIN [(1)], Oyeyemi OLANIRAN [(1)]

(1) Howard University Hospital, Dept Of Community And Family Medicine, Washington, Dc, États-Unis
(2) Trakya University School Of Medicine, Family Medicine Department, Edirne, Türkiye
(3) Shirley Health Partnership, Southhampton, Royaume-Uni

Context: Clinical documentation is foundational to high-quality primary care but remains variable in accuracy, completeness, and usefulness. While often viewed as administrative task, documentation plays a critical role in clinical decision-making, population health measurement, health policy, and advocacy. In U.S. primary care settings, studies report that 40–50% of patient issues discussed during visits are incompletely captured in clinical notes, leading to missed opportunities for follow-up and care coordination. Poor documentation undermines quality measurement, risk adjustment, and system-level planning. Conversely, optimized and structured documentation improves outcomes, increasing compliance by 15–20% and enhancing population health metrics reporting.

Objectives: To review existing literature on clinical documentation practices in primary care, examining documentation quality, impact on care delivery and continuity, and implications for leadership, advocacy, and health systems strengthening, with a focus on family physicians.

Methods: A structured literature search was conducted using PubMed, Scopus, and Google Scholar for English-language studies published between 2013 and 2025. Search terms included "primary care documentation," “clinical note quality,” “electronic health records,” “documentation workflow,” and “health systems.” Inclusion criteria encompassed peer-reviewed studies evaluating documentation outcomes related to care quality, workflow efficiency, population health measurement, or system performance. Non–primary care specialties and non-empirical reports were excluded. Findings were synthesized narratively to identify key trends and leadership implications.

Results: A prospective observational study of 49 primary care encounters in the U.S. Veterans Affairs system demonstrated frequent omission of patient-initiated concerns and unverified information in nearly half of clinical notes. Structured and standardized documentation improved documentation quality scores by approximately 12.8 points compared with unstructured notes. Consistent documentation patterns correlated with improved efficiency and reduced clinician burden. Family physician–led practices implementing standardized documentation protocols demonstrated enhanced care continuity, improved risk adjustment accuracy, and more efficient reporting for quality improvement and policy initiatives.

Discussion: Highlight documentation as critical for improving clinical quality, population health measurement, and system accountability. Optimized documentation supports accurate representation of patient complexity, strengthens continuity of care, and enables actionable data for advocacy and policy engagement.

Conclusion: Optimized clinical documentation improves care quality, efficiency, and population health monitoring, influencing health policy and system performance. As family physicians, leveraging documentation as a leadership and advocacy tool.

ID 1794- The new French professional framework for general practice: a tool for advancing the specialty

Racha ONAISI [(1)] , Jacques BATTISTONI [(2)], Pauline BERTOIS [(3)], Olivier CADIOU [(4)], Frederic CHEVALLIER

[5], Antoine DE BECO [6], Eric MAY [7], Yohan SAYNAC [8]

(1) Cmg, Bordeaux, France
(2) Cmg, Caen, France
(3) Cmg, Lyon, France
(4) Cmg, Nancy, France
(5) Cmg, Ermont, France
(6) Cmg, Verrières-Le-Buisson, France
(7) Cmg, Malakoff, France
(8) Cmg, Pantin, France

Context: In a context of crises and challenges (aging population with increasing multimorbidity, decreasing number of healthcare professionals, need for a One Health approach, numerical revolution...), where social determinants of health need to be better adressed, primary care, and notably general practice, are a chance to build and strenghten a more sustainable, resilient and efficient healthcare system. This requires to better define our profession, for both GPs and all stakeholders involved in health and health policies.

Methods: The XXX College of General Practice (XXX) missionned a 9-member steering committee from its member structures to update the previous professionnal framework. A collaborative and iterative process was conducted. We reviewed pre-existing frameworks in XXX and in the literature. We sought for contributions on the present and future perspectives for general practice from the structures representing the profession, from representatives of other primary and secondary healthcare professionnals, from patient's representatives and from stakeholders and experts in healthcare policies. A concertation conference gathering representatives from the XXX structures was held in december 2024. The steering committee subsequently synthetised these data and analysed it in light of the existing and upcoming challenges to produce a document, that was approved by the XXX structures in March 2025.

Originality: This updated professional frameworks presents the values, missions and competencies of general practice in the XXX context, aligned with international definitions. Its originality lies in its articulation around missions, derived from the population's he

Lessons learned and future implication: Despite diversity and divergences, the XXX structures agreed on the updated professionnal framework. Since its publication, it was presented to several stakeholders and in debates about general practice. It will continue to be presented, notably to the na

Discussion: Presenting our work could participate in inspiring participants from other countries to conduct similar works while providing us with a broader vision to enhance our ongoing national advocacy work.

Conclusion: This work is in line with goal 1 (advancing Family Medicine) of WONCA strategic plan 2023-2027.

ID 1744- Linking SNOMED CT to ICPC-3: a pathway for survival for the primary care classification

Joseph ROUMIER, Bianca DE SÁ E SILVA, Oliver VAN HECKE, Diego SCHRANS, Jan DE MAESENEER, Robert VANDER STICHELE

Ghent University, Ghent, Belgique

Context: Health care systems are rapidly undergoing digital transformation, after relative slow adoption of medical informatics standards. E-health organisations are transforming national health care sectors and promoting the use of SNOMED CT as a reference terminology. The position of domain-specific classifications such as ICPC-3 within this transformation remains unclear.

Objectives: To describe the methodologies used for mapping the reference terminology SNOMED CT as source to the International Classification of Primary Care (ICPC-3) as target; to report on preliminary results; to describe planned future work and strategies.

Methods: Three different approaches were used: 1) using the Belgian Bilingual Biclassified thesaurus (a large, aligned collection of Dutch and French words and phrases used in primary care), linked to a dyad of ICPC-2 and ICD-10 codes, and to SNOMED CT as a starting point. An ICPC-2 to ICPC-3 conversion table was used to generate a selection of possible ICPC-3 classes per SNOMED CT concept, followed by human validation; 2) Semantic manual comparison of the two hierarchies by studying

parents and children in SNOMED CT and class labels, exclusion and inclusion terms in ICPC-3; 3) Automated mapping based on label similarity (exact string match and fuzzy matches) validated by experts.

Results: ICPC-3 candidate matches were selected for 4.163 SNOMED-CT concepts. After filtering for mappings with only one candidate, the conversion table approach retrieved 1339 SNOMED-CT concepts and 343 ICPC-3 classes. The manual approach was applied to 1 of the 200 clinical issues for graduate and vocational training in general practice, starting with a use case on “low-back pain” and identifying 250 concepts. Results from the automated mapping approach are still pending and will be presented at the time.

Discussion: Three methods for mapping were established and validated in a sample of SNOMED CT codes and a collection of ICPC-3 classes. Further progress can be made by using crowdsourcing with international teams of researchers and Primary Care teaching facilities.

Conclusion: It is possible to construct sophisticated terminological resources that link language, reference terminologies and aggregation terminologies, which may support medical documentation and clinical coding by general practitioners at the point of care, either directly or as part of AI solutions.

Corresponding author: Joseph Roumier, joseph.roumier@ugent.be

ID 1568- Academic family medicine - keep growing it!

Amanda HOWE

University Of East Anglia, Norwich, Royaume-Uni

Context: The status of family medicine as a speciality requires academic leads for both primary care teaching and research. In medical education, there is clear evidence that graduates in medicine are more likely to choose family medicine if they have had positive role models in their medical schools, and good clinical placements with family doctors. But in many countries, opportunities to develop an academic career are underfunded compared to other specialities; and posts in universities for family doctors are few in proportion to their overall numbers and needs. This presentation will summarise the data from one country, show reasons why this matters, and also show things that we can do to help .

Methods: Slide presentation of history of family medicine in the UK, its academic profile, current challenges, evidence of need for change, and examples of good practice that can alter the situation in a sustainable manner.

Originality: This is my own synthesis of different reports, policies, and national databases. I have been involved with these discussions ar a national level.

Lessons learned and future implication: Academic family doctors are essential for teaching medical students about family medicine - its patients, its contribution to population health, and its core clinical expertise. They are also vital for medical research, to recruit in primary care and give

Discussion: Attendees can consider the extent to which they and their member organisations get involved with teaching and research, and how to contribute to this aspect of our speciality from a practical and professional perspective.

Conclusion: This will be an awareness raising presentation, and hopefully will engage the audience to consider their own collaborations with academic colleagues.

ID 1489- Primary care experience in Canada: results from the 2025 OurCare National Survey

Tara KIRAN

St. Michael's Hospital & University Of Toronto, Toronto, Canada

Context: Access to primary care remains a persistent challenge in XXX, compounded by limited transparent and timely reporting across jurisdictions. OurCare, the country’s largest public

engagement initiative on primary care, engaged nearly 10,000 people to create the OurCare Standard—defining what people expect from their primary care system.

Objectives: To assess the extent to which primary care in xxx is meeting patient and public expectations set out in the OurCare Standard.

Methods: We conducted a cross-sectional, bilingual online survey developed with input from clinicians, researchers, policy-makers, and patient and caregiver advocates. Eligible participants were national residents aged 18 or older. Respondents were recruited through a proprietary online panel and public outreach, including television, radio, newspapers, social media, and partner networks. Only complete responses were analyzed. Data were weighted to reflect the xxx adult population on sex, age, education, region, language, immigration-status, and race. All analyses used weighted data.

Results: We analyzed 16,299 complete responses. Overall, 81.0% (95% CI: 79.9%-82.2%) reported having a family doctor or nurse practitioner, and an additional 1.4% (95% CI: 1.0%-1.7%) reported receiving care from a primary care clinic or team. Only 36.9% of those with a regular clinician obtained a same-day (20.1%, 95% CI: 18.1%-22.1%) or next-day (16.8%, 95% CI: 14.8%-18.8%) appointment for an urgent issue. 11.6% of people with a regular clinician reported experiencing some form of discrimination, compared to 22.8% of those without one. 67.2% of people with a regular clinician were satisfied or very satisfied with supports for their general well-being versus 28.7% of those without. Only 27.8% of respondents were satisfied (22.3%, 95% CI: 21.1%-23.5%) or very satisfied (5.5%, 95% CI: 4.9%-6.1%) with how the country's primary care system is working.

Discussion: Despite universal health insurance, OurCare survey results suggests that almost 1 in 5 people in XXX do not have access to primary care. Only a minority of those with primary reported timely access for an urgent issue. Those without a regular primary care clinician report more discrimination and less support for general well-being.

Conclusion: The current primary care system in XXX falls short of people's vision for an accessible, wellness-oriented, inclusive and responsive system.

ID 1129- Expert Generalists as Bridge-Builders: Strengthening Primary Care

Jan JANSEN, Laura DE VRIES

Dutch College Of General Practitioners, Utrecht, Pays-Bas

Context: Primary care faces growing complexity, driven by demographic shifts, chronic disease, and digitalization. These pressures risk reducing care to protocols and productivity, undermining humanistic values. This paper introduces the Dutch model of the kaderhuisarts — a general practitioner with advanced expertise. This ‘expert generalist’ offers a structured approach to maintain quality and innovation in primary care.

Methods: Supported by national GP organizations (LHV, NHG, InEen, UNH), this model combines 10 medical subspecialty training programs and 11 expert groups across domains such as asthma/COPD, cardiovascular disease, diabetes, mental health, elderly care, palliative care, urogynaecology, musculoskeletal medicine, sexual health, and emergency care.

Originality: Expert generalists strengthen primary care by leading quality improvement and innovation, ensuring consistent standards through regional collaboration and guideline implementation, and supporting cooperation with secondary care.

Lessons learned and future implication: They provide consultation, deliver tailored education, and contribute to guideline development, policy and research. Their competencies—advising, initiating projects, teaching, and driving research—position them as bridge-builders between science and prac

Discussion: A structured analysis of the training programs and expert groups, articles in the opinion journal 'Huisarts en Wetenschap' and feedback from the national GP organizations provide a picture of structured development and recent reform towards uniform training and governance in the Dutch expert generalist model over 20 years. They sustain person-centered care, strengthen quality, and

enhance collaboration and resilience in healthcare systems.

Conclusion: By investing in expert generalists, health systems can mitigate fragmentation and reinforce fraternity and solidarity. In an era of efficiency and scarcity, such commitment is essential—without it, primary care risks losing its human soul.

ID 579- Determining and disseminating research priorities in primary care; what's next after deciding the Top Ten?

Laura O'CONNOR, Susan M SMITH, Andrew MURPHY

University Of Galway, Galway, Irlande

Context: Chronic conditions are extremely common, with approximately 1 million people in Ireland affected by the top 4 conditions alone. This is expected to significantly increase in the future due to Ireland's aging population. The HRB Primary Care Clinical Trials Network, using the James Lind Alliance (JLA) Priority Setting Partnership (PSP) method, have developed a Top Ten list of priority research questions for managing chronic conditions in primary care in Ireland.

Objectives: The JLA method results in ranked lists of unanswered research questions which can be used to direct researchers, funders, and other key interest holders to topics most important to those directly affected by a given condition. In this PSP, the objective was to provide a foundational resource for people wishing to carry out impactful research in primary care in Ireland and beyond.

Methods: The project was led by a steering group of patients and representatives, carers, and clinicians, and all stages of the process centred these interest holders. In the PSP method, partnerships collect submissions to be grouped and formed into indicative questions, checked against existing literature to identify under-researched topics, and ranked in a process that centres patients, carers, and clinicians.

Results: This resulted in 20 ranked priority questions, with a focus on the Top Ten which covers a range of areas including information exchange, non-drug treatments, multidisciplinary care, and use of health care data.

Discussion: Our work since the determination of the top priorities has been to promote this as a tool to align research and service provision to the priorities of patients, carers, and healthcare professionals. Alongside traditional dissemination, this has involved engaging with funders, researchers, patient organisations and health services. This presentation will reflect on the value of the process in determining research priorities, and on key learnings from the equally important work to integrate priorities into active research.

Conclusion: The use of the equitable JLA PSP method results in a robust and meaningful output of prioritised research topics, ready for us in Ireland and beyond. The integration of such priorities into research and service provision is a key part of the process, though comparatively understudied and unaddressed by resources.

Public health

ID 1035- Examining policies and trends in ADHD diagnosis and management in primary care in children and youth: an International Consortium of Primary Care Big Data Researchers (INTRePID) study

Karen TU, Carla LAPADULA, Tokuharu TANAKA, Debra BUTT

University Of Toronto, Toronto, Canada

Context: Attention Deficit Hyperactivity Disorder (ADHD) is a common condition in children and youth, with varying levels of primary care involvement across countries. Primary care involvement in ADHD diagnosis and management has the potential to improve efficiency, cost-effectiveness and equity for ADHD care.

Objectives: This study examined policies with respect to primary care physicians (PCPs) ability to diagnose and prescribe ADHD medications and analyzed ADHD-related visits to primary care amongst 5-19 year olds across nine INTRePID countries: Australia, Brazil, Canada, Indonesia, Mexico, Norway, Peru, Sweden, and the US.

Methods: A document review and key informant survey was conducted in PCPs in each country. ADHD-related visit rates (2018–2023) were calculated as a percentage of total visits. Negative binomial regression estimated rate ratios (RRs, 95% CI) across Pre-pandemic (2018–2019), Pandemic (2020–2021), and Recovery (2022–2023) periods, adjusting for sex, seasonality, and offsetting by total visits. Sex-specific RRs were derived from stratified analysis.

Results: The ability for PCPs involvement in ADHD varied by country, with Canada and the US having full abilities, Australia recently introducing reforms, and all other countries having significant restrictions. Overall, North America had the highest ADHD-related visit rates: US (8.15%), Mexico (1.99%), and Canada (1.31%), while Indonesia had the lowest (0.03%). During the pandemic, rates increased in all countries with significant increases ranging from rate ratio (RR) 1.87; (95% CI: 1.61–2.17) to RR:1.16; (95% CI: 1.05–1.27) compared to the pre-pandemic. Rates remained higher than in the pre-pandemic during the recovery period in all countries, although differences were non-significant in Indonesia and Mexico. Across all countries, visit rates were 1.66 to 5.86 times higher in males than females. However, relative increases during the pandemic and recovery periods were more pronounced in females in over half of the countries.

Discussion: ADHD-related primary care visits varied across countries, likely reflecting differences in care models and cultural factors. However rates increased over time, particularly among females in all countries.

Conclusion: Better integration of ADHD care in primary care could help reduce care gaps globally.

Corresponding author: Karen Tu, k.tu@utoronto.ca

ID 850- Primary Care Mortality Committee: Innovation, Quality and Humanization

Maria ARENAS, Marta BERTRAN, Laura PALLAS, Carolina ECHEGARAY, Montañes FRANCIISCO, Cereijo ANA CLARA, Gurt ALBA, Dominguez OLGA, Del Val MIQUEL

Parc Sanitari Pere Virgili, Barcelona, Espagne

Context: The implementation of a Mortality Committee at CAP of Barcelona represents an innovative initiative within the field of primary care, aimed at improving care quality and clinical safety through the systematic analysis of death cases. Although mortality committees are a well-established practice in hospital settings, their application in a primary care centre is still uncommon, which gives the project a clearly distinctive and pioneering value within the primary care network.

Objectives: • To systematically review and analyze the deaths registered within the scope of the Primary Care Centre (CAP). • To identify opportunities for improvement in clinical practice and continuity of care. • To promote a culture of patient safety and shared learning within the healthcare team. • To generate recommendations to optimize care pathways and coordination with other levels of healthcare. • To monitor the implementation of adopted measures.

Methods: • Each selected case will be presented anonymously and structured according to a standard template (clinical summary, social context, chronology, critical points, reflections). • The analysis will follow a qualitative, non-punitive review model, based on continuous learning and improvement. • The conclusions will focus on: o Identifying contributory factors (clinical, organizational, communicative, social). o Proposing concrete and feasible improvement actions. o Sharing identified good practices.

Results: Sixty successful cases from the last three months were reviewed. The mean patient age was 80 years. Sixty percent had not attended the Primary Care Centre in the preceding three months, and 50% were not correctly classified as PCC-MACA. Ninety percent had an individualized care plan, while 40% had made two emergency department visits in recent years. None had received a condolence or support communication, and 90% of

records showed incomplete coding of successful outcomes.

Discussion: Overall, this proposal represents a step forward in organizational innovation and the culture of quality in primary care, with the potential to be replicated in other centers across the network, strengthening CAP BCN commitment to excellence, humanization, and the continuous improvement of health services.

Conclusion: Represents a cultural shift and a new way of working within primary care quality standards. It should be mandatory committee across all primary care services in Europe

ID 489- The impact of non-pharmaceutical interventions on anxiety: evidence from the COVID-19 pandemic in four African countries

Marianne CASTELNAU [(1)] , Jule BECK [(2)], Mekdim Dereje REGASSA [(3)], Wolfgang STOJETZ [(4)], Tilman BRÜCK [(5)], Anke HOEFFLER [(2)]

(1) Sorbonne Université, Paris, France
(2) Universität Konstanz, Konstanz, Allemagne
(3) Leibniz Institute Of Vegetable And Ornamental Crops, Großbeeren, Allemagne
(4) International Security And Development Center, Berlin, Allemagne
(5) Humboldt-University Of Berlin, Berlin, Allemagne

Context: Non-pharmaceutical interventions (NPIs) were implemented worldwide to limit the spread of COVID-19. While effective in reducing transmission, concerns emerged about their effects on mental health. In low-income countries, impacts may be especially severe due to limited mental healthcare. However, evidence on mental health impacts of NPIs in these countries remains scarce.

Objectives: To investigate the association between NPI stringency and anxiety in XXXX countries during the COVID-19 pandemic, to explore the differential effects of specific NPIs across population groups.

Methods: Data were extracted from the Life with Corona XXXX survey, a cross-sectional phone survey conducted throughout 2021 in XXXX, XXXX, XXXX, and XXXX (24,000 observations). Adult participants were randomly selected from pre-existing databases, using stratified random sampling by age, gender and residence. Survey data were combined with policy data from the Oxford COVID-19 Government Response Tracker. Anxiety symptoms were assessed using the GAD-7 scale. Multivariable logistic regression models and interaction analyses were performed, including country- and month-fixed effects.

Results: Higher policy stringency was associated with increased odds of anxiety symptoms (OR= 1.15, 95% CI: 1.11–1.20). Among specific policies, school closures (OR= 1.70, 95% CI: 1.54–1.87) and public transport closures (OR= 2.15, 95% CI: 1.83–2.54) showed the strongest associations with anxiety. Interaction analyses revealed that women, adults over 25, and individuals from higher socioeconomic groups were more affected by school closures, while men, adults under 25 or over 55, and those from the highest socioeconomic group were more affected by transport restrictions.

Discussion: This study is the first to examine the mental health impact of different NPIs across XXXX. Its large sample and consistent findings across sensitivity analyses strengthen the robustness of the findings. However, aggregated NPI data and the cross-sectional design limit causal inference. The association between NPIs and anxiety likely reflects multiple pathways, including economic hardship, reduced mobility, domestic tensions, and social isolation.

Conclusion: Integrating mental health considerations into public health preparedness and policy design is essential to ensure equitable and effective responses in future health crises. For general practitioners, awareness of anxiety linked to restrictive policies is essential, as they are often the first point of contact for distressed patients.

ID 470- The impact of retrieving financial incentives and information provision on

primary care quality: a randomized clinical trial (RCT) in Catalonia

Ermengol COMA [1] , Roger ESTEBAN-FABRÓ [2], Elisabet BALLÓ [3], Eduardo HERMOSILLA [2], Leonardo MÉNDEZ-BOO [1], Carolina GUIRIGUET [1], Gabriel FACCHINI [4], Catia NICODEMO [5], Josep VIDAL-ALABALL [6]

(1) Institut Català De La Salut, Barcelona, Espagne
(2) Idiap Jordi Gol, Barcelona, Espagne
(3) Institut Català De La Salut, Girona, Espagne
(4) University Of London, London, Royaume-Uni
(5) University Of Oxford, Oxford, Royaume-Uni
(6) Institut Català De La Salut, Vic, Espagne

Context: Financial incentives and information provision are common strategies to improve quality of care. Because they are often applied together, it has been difficult to distinguish their individual effects. In Catalonia (Spain), both have been used in the public health system for nearly 20 years, but many quality indicators have plateaued. This study aims to identify the specific impact of financial incentives and information provision on quality of care.

Objectives: To evaluate the impact of removing financial incentives and information provision via an online platform on primary care quality indicators.

Methods: An unblinded cluster randomized controlled trial is being conducted with 63 primary care practices and 1,433 professionals (GPs and nurses). They were randomized into three groups: (1) control, unchanged; (2) removal of financial incentives for 7 quality-of-care indicators; and (3) removal of both financial incentives and information for those indicators. The primary endpoint is the monthly result for the seven indicators; secondary variables include PCP, professional and patient characteristics. Mixed models will be used to compare the intervention effects among groups. Results are monitored weekly from February to December 2025.

Results: As of November 2025, incentive removal caused significant reductions in 3/7 indicators: 2.7% drop for arterial pressure (AP) control in diabetic patients, 4.1% for AP control in chronic renal failure, and 6.3% for inhaler technique verification. Removing information significantly reduced inhaler technique verification results (extending to a 14.5% drop), AP control in ischemic heart disease (7.3% drop) and diagnostic adequacy of hypertension (11.9% drop); the latter two were not affected by incentive removal alone. AP control and treatment adequacy in hypertense patients were unaffected by the interventions. Final results will be presented at the congress.

Discussion: The varied effects across indicators suggest that some professional practices are well established and less dependent on external support, while others rely more on financial or informational reinforcement. Tailoring quality improvement strategies to the maturity and nature of each indicator may enhance their long-term effectiveness.

Conclusion: We identified the distinct effects of information and financial incentives to guide the design of more efficient and sustainable quality improvement initiatives in primary care.

ID 443- Integrating GP Health Records with Exposure Data: Methods and Lessons from Intego-MGZ

Pieter JANSEN [1] , Simon BEERTEN [1], Arne JANSSENS [1], Katrien DE TROEYER [2], Tine DE BURGHGRAEVE [1], Maarten CASPERS [1], Hans HOOYBERGHS [3], Bart BAUTMANS [4], Bert VAES [1], Gijs VAN POTTELBERGH [1]

(1) Ku Leuven, Leuven, Belgique
(2) University Of Antwerp, Antwerp, Belgique
(3) Vito, Mol, Belgique
(4) Flemish Government Department Of Care, Brussels, Belgique

Context: Environmental stressors, such as heat stress, low air quality, traffic noise and the absence of green spaces are adversely associated with public health. Understanding these associations at a local level is crucial for monitoring health impacts and evaluating policy decisions related to environmental health. Primary care health data offer several advantages in this aspect, as they can detect more subtle and earlier health impacts, allow long-term monitoring of environmental health and involve a generalist approach, containing a wide range of health impacts while also considering the patient's social context.

Objectives: In this paper, we explore whether routinely collected primary care morbidity data can be linked with environmental data, the methods used, the possibilities of this linked dataset and its strengths and limitations.

Methods: Intego, a Flemish primary care morbidity registry containing medical and demographic information from general practitioners' electronic health records, was linked to several environmental stressors at the home address of a patient. Data on temperature, humidity, air pollutants, traffic, noise levels and green spaces were retrieved from several Flemish and Belgian data sources.

Results: The resulting dataset, "Intego-MGZ", includes information on environmental stressors for 318,835 patients after the last linkage, in addition to demographic and primary care health data. This dataset enables comprehensive environmental health analyses.

Discussion: With this dataset, we will be able to perform elaborate analyses to better understand the impact of environmental stressors on public health. Furthermore, possible health effects of mitigating policy decisions can be monitored. Future linkages can be performed periodically to track long-term environmental health trends in Flanders.

Conclusion: The methods described in this article stress the importance of general practitioner data in environmental health research. As a first point of contact for many patients experiencing early symptoms due to environmental factors, general practitioners play a crucial role in environmental health research and adaptation strategies.

ID 283- Knowledge, Attitudes, and Practices of Health Officials in Dengue Prevention in Sri Lanka

Umber KHAN [1] , M.I. M SHUJA [2], A. C. Aara THILFAR [2]

(1) Shirley Health Partnership, Southampton, Royaume-Uni
(2) Faculty Of Medicine And Allied Sciences, Rajarata University Of Sri Lanka., Colombo, Sri lanka

Context: The National Dengue Prevention and Control Strategy (2019–2023) was developed to strengthen disease surveillance and community engagement. Despite this, recurrent outbreaks indicate ongoing operational shortcomings. Health officials serve as the vital link between national policy and grassroots implementation; however, empirical evidence describing their knowledge, attitudes, and practices (KAP) remains limited. Understanding these dimensions is crucial for translating policy into effective local action.

Objectives: To assess the knowledge, attitudes, and practices of health officials regarding national dengue prevention strategies and to identify determinants influencing their field-level implementation capacity.

Methods: A descriptive cross-sectional mixed-methods study was conducted among 80 health officials, including Medical Officers, Public Health Inspectors, Field Workers, and administrative personnel from regional and national health institutions. A WHO-adapted and locally validated KAP questionnaire was administered using stratified random sampling according to professional category, with systematic replacements for non-respondents. Additionally, ten key informant interviews were conducted with purposively selected program stakeholders. Quantitative data were analyzed using descriptive statistics, one-way ANOVA, and chi-square tests, while qualitative data underwent thematic content analysis.

Results: Adequate knowledge (≥4/5) was demonstrated by 27.5% of participants, 51.3% expressed favorable attitudes (≥20/25), and only 11.3% reported good preventive practices (≥20/28). Knowledge and practice varied significantly by job category ($p = 0.007$ and $p = 0.006$), whereas attitudes did not ($p = 0.080$). No significant correlations were observed between KAP scores and years of service ($r = 0.18$, $p = 0.115$) or sex ($t(57) = 1.53$, $p = 0.131$). Qualitative findings highlighted gaps in timely resource mobilization, intersectoral

collaboration, role-specific training, and integration of surveillance systems.

Discussion: Despite a comprehensive national strategy, frontline health officials showed low knowledge and practice levels, with disparities across professional categories. Systemic factors—such as delayed resources, weak intersectoral coordination, and insufficient role-specific training—appear to drive these gaps more than individual characteristics. Strengthening communication pathways, ensuring equitable resource allocation, and implementing targeted capacity-building initiatives are essential to enhance translation of policy into effective field-level dengue control.

Conclusion: Bridging operational gaps through structured training, timely resource distribution, and improved coordination is critical to improve dengue prevention performance and achieve sustainable outcomes in Sri Lanka.

ID 58- Urban Rural Disparity in Reproductive and Child Health Care in India

Dewaram NAGDEVE

International Institute For Population Sciences, Mumbai, Inde

Context: The Reproductive and Child Health (RCH) Programme launched in 1997, aims to reduce maternal, infant, and child mortality by improving healthcare access in rural areas. Key components include prenatal care, safe delivery, postnatal services, immunization, nutrition, adolescent health, family planning, and empowering women through reproductive health awareness and services.

Objectives: To examine the urban-rural disparity in the maternal and child health input, its utilization, and output during NFHS –1 and NFHS-5.

Methods: This study analyzed data from NFHS-I (1992–93) and NFHS-V (2019–21), covering 89,777 and 7,24,115 women respectively, using bivariate analysis and chi-square tests.

Results: India made significant progress in reproductive and child health, especially in rural areas between 1992–93 and 2019–21. Improvements were seen in antenatal care, immunization, institutional deliveries, and contraceptive use. Maternal education emerged as a strong predictor of better health outcomes. Scheduled castes and tribes saw notable gains, while socio-religious groups showed varied progress. Mortality rates declined across all groups, with sharper drops in rural areas. Chi-square analysis confirmed strong links between socio-economic factors and improved health service utilization and outcomes.

Discussion: India witnessed significant improvements in reproductive and child health across urban and rural areas, though notable disparities remain. Antenatal care, institutional deliveries, immunization, and treatment for childhood illnesses improved, with rural areas showing higher percentage gains. Yet, urban areas retained higher absolute service utilization. Gaps in full immunization and antenatal visits narrowed considerably. Maternal education emerged as the strongest determinant of improved outcomes, alongside caste, residence, and birth order. Mortality rates declined across all demographics, especially in rural areas. Chi-square analysis confirmed strong associations between socio-economic factors and health outcomes, stressing the need for equitable healthcare access.

Conclusion: India saw major improvements in reproductive and child health, though urban-rural disparities persist between 1992–93 and 2019–21. Rural areas recorded larger relative gains in institutional deliveries and contraceptive use, yet urban areas remained ahead overall. Maternal education strongly influenced positive health outcomes. Socio-demographic factors like caste, religion, and residence showed significant associations with health indicators. Addressing these disparities requires targeted interventions, improved rural outreach, and inclusive health policies to ensure equitable healthcare access for all population groups in India.

Pulmonary infections

ID 1839- BREATH-EPOC: Bronchial exacerbations and tracking in health. Population-based registry of exacerbations of chronic obstructive pulmonary disease

Brenda Biaani LEÓN GÓMEZ [(1)] , Erazo SUSANA [(2)], Núria MONTELLÀ JORDANA [(3)], Candela SANCHO [(1)], Faranak NOORIANKAFSHGARI [(1)], Rosa Maria GARCIA SIERRA [(1)], Pere TORÁN MONSERRAT [(3)]

(1) Institut D'investigació En Atenció Primària De Salut Jordi Gol (idiapjgol), Barcelona, Espagne
(2) Institut Català De La Salut, Cardedeu, Espagne
(3) Institut Català De La Salut, Barcelona, Espagne

Context: Exacerbations of chronic obstructive pulmonary disease (COPD) are a key determinant of clinical deterioration, healthcare resource use and mortality. However, most of the evidence comes from hospital settings and selected series, with a scarcity of population-based data in primary care that would allow the real burden of exacerbations, their evolution and potential inequities in management and outcomes to be described.

Objectives: To develop an ambispective, population-based registry of COPD exacerbations in primary care (BREATH-EPOC) and, in the medium term, to describe incidence, clinical progression, healthcare utilisation and mortality, as well as potential inequities in these outcomes according to sociodemographic and clinical characteristics.

Methods: BREATH-EPOC is a population-based, multicentre registry of COPD exacerbations in primary care within the Institut Català de la Salut in Mataró (five primary care centres). Adults aged ≥35 years with a COPD diagnosis recorded in the electronic health record and/or spirometry consistent with COPD (post-bronchodilator FEV_1/FVC <0.70 or z-score <−1.64), clinically stable for ≥2 weeks and providing informed consent will be included. The registry is organised by exacerbation episodes (first event within a defined period, with ≥72 hours of stability required to separate episodes). Follow-up will last 24 months from the first exacerbation included, combining face-to-face visits (baseline and 24 months), telephone contacts (12 months) and systematic review of medical records (6 and 18 months) to collect exacerbations, hospitalisations, treatments, comorbidities and mortality.

Results: The registry is in the implementation phase in the five participating primary care teams, with recruitment pathways already defined. The presentation will report early implementation indicators, including the number of eligible and included patients, basic age and sex distribution, the frequency of exacerbations recorded in the first months and the completeness of key variables.

Discussion: BREATH-EPOC will provide a stable framework to monitor COPD exacerbations in a population-based primary care context, enabling estimation of the real burden of episodes, description of their clinical course and analysis of healthcare utilisation and mortality, with an equity perspective.

Conclusion: BREATH-EPOC aims to address the current lack of community data on COPD exacerbations and to generate transferable local evidence to optimise clinical practice, planning and interventions for patients with COPD.

ID 1171- Consultations, etiology and recovery in older people consulting in European primary care for acute respiratory tract infections

Alike VAN DER VELDEN [(1)] , Ushma GALAL [(2)], Oliver MARTYN [(3)], Christopher BUTLER [(2)]

(1) University Medical Center Utrecht, Utrecht, Pays-Bas
(2) University Of Oxford, Oxford, Royaume-Uni
(3) Sanofi Vaccines, Copenhagen, Danemark

Context: Respiratory tract infections (RTIs) cause significant morbidity and mortality in older adults and high-risk populations. However, limited data exists on the incidences and clinical burden of respiratory viruses in primary care patients with RTI. Understanding these factors is crucial for informing public health policies and prevention strategies.

Objectives: To estimate the clinical burden and disease course of Respiratory syncytial virus (RSV), Human metapneumovirus (HMPN) and Human parainfluenza viruses (HPIV) compared to other

respiratory viruses in older adults presenting to primary care in five European countries.

Methods: This observational study is enrolling patients aged ≥60 years and those 50-59 years who are eligible for influenza vaccination, presenting to their GP with RTI symptoms of ≤10 days duration. The study operates in UK, France, Spain, Italy, and Germany with structured monthly recruitment targets to enable monthly and full year incidence estimations. GPs register participant's baseline data and take a throat/nose swab for multiplex PCR analysis. Participant follow-up is through self-completed diaries for 28 days (symptoms, recovery, and EQ-5D) and clinical records (re-consultations and complications).

Results: Currently 946 participants are enrolled. Respiratory viruses were detected in 60.6%: Human rhinovirus (20.2%), HPIV (8.8%, predominantly PIV-3: 5.8%), Influenza (7.4%), SARS-CoV-2 (6.4%), HMPV (5.4%), and RSV (3.3%). Among 394 participants with complete data, the mean age was 69 years, with substantial comorbidity. Vaccination rates were: SARS-CoV-2 (93%), Influenza (45%), and Pneumococci (27%). Time to return to usual daily activities varied by viral pathogen, with symptoms from Influenza infection lasting longest. Time to full recovery was taking significantly longer. Mean EQ-5D VAS score improved from 61 to 80 within 14 days post-consultation. Healthcare utilization included GP re-consultation (14%) and hospital visits for RTI-related complications (2%). Updated data, also per viral etiology, will be presented.

Discussion: PCR surveillance, combined with monthly numbers of all presenting older patients with RTI that is captured in the study, demonstrate substantial burden of a range of respiratory viruses in older adults presenting to primary care. These epidemiological data are relevant to inform targeted prevention strategies.

Conclusion: Recovery times and healthcare re-consultation rates suggest significant clinical impact of respiratory viruses in elderly.

ID 966- Prolonged respiratory symptoms in a socially vulnerable young adult leading to a diagnosis of cavitary pulmonary tuberculosis

Clara RICART PLANAS, Pau VILURBINA PÉREZ

Semfyc, Camfic, Barcelona, Espagne

Context: Prolonged respiratory symptoms are frequently encountered in general practice and are often attributed to benign or self-limiting conditions. However, when symptoms persist in socially vulnerable patients, serious infectious diseases may be overlooked. This practice-based reflection presents a case of cavitary pulmonary tuberculosis (TB) in a young adult living in precarious housing, illustrating diagnostic challenges and the central role of primary care in early case detection.

Methods: A 23-year-old man presented repeatedly over three months malaise, odynophagia, cough with nocturnal predominance, dysphonia, mechanical chest pain and reduced appetite. Additionally he mentioned one recent unique mild self-limited hemoptysis. No fever or rhinorrhea. His social context included living in an inadequately conditioned commercial space. Physical examination was unremarkable. Initial blood tests showed mild inflammatory markers without specific abnormalities. Due to the chronicity, lack of improvement, and social vulnerability, pulmonary TB was suspected. Chest radiography revealed a left apical cavitary lesion. Sputum culture and molecular testing confirmed Mycobacterium tuberculosis without rifampicin resistance. The patient was referred to Pneumology. Standard quadruple therapy was initiated, alongside respiratory isolation, compulsory notification, and contact tracing. The patient followed the indications, nowadays he is pending a check-up at Pneumology.

Originality: Although TB remains present in Europe, its occurrence in young immunocompetent patients without clear epidemiological exposure can delay diagnosis. This case highlights the diagnostic value of integrating social determinants and longitudinal assessment in

Lessons learned and future implication: This case emphasizes the importance of maintaining a low threshold for TB testing in persistent respiratory symptoms, particularly in patients living in

precarious conditions. It underscores the need for improved coordination among primary care, hospital,

Discussion: This experience highlights the broader impact of structural determinants on health and supports the role of primary care in early identification of complex infectious diseases.

Conclusion: Holistic primary care assessment, integrating biomedical and social factors, is crucial for timely TB suspicion and diagnosis while promoting equity and humanistic practice.

ID 795- Avoidable hospital admissions for COPD: A case-control study on associated factors

Ana Rita QUEIRÓS [(1)] , Ana Rita PRATAS [(2)], Beatriz SIMÃO PARREIRA [(2)], Adriana COSTA [(2)], Ana Patrícia LOURENÇO [(2)], Leila AMARO CARDOSO [(2)], Clara BARROS FONSECA [(1)], Jorge ALMEIDA [(2)]

(1) Usf Garcia De Orta, Porto, Portugal
(2) Hospital De São João, Porto, Portugal

Context: Chronic obstructive pulmonary disease (COPD) is a major public health problem due to its high prevalence, morbidity and mortality. Acute exacerbations are a frequent cause of hospital admission and contribute considerably to healthcare burden. In Portugal, the primary care performance indicator “Hospital admission rate for asthma or COPD in adults” classifies these episodes as avoidable admissions. However, this classification needs to be questioned, as it may oversimplify the clinical and social complexity underlying each case and overlook factors beyond the reach of primary care teams.

Objectives: This ongoing study aims to identify factors associated with hospital admissions considered avoidable due to COPD exacerbation. It compares patients admitted to hospital (cases) with patients with COPD followed in primary care without admissions (controls). Additional objectives include assessing the adequacy of pharmacological treatment according to COPD severity and exploring how sociodemographic, clinical, behavioural and biological characteristics influence admission risk.

Methods: This observational, analytical case-control study includes patients admitted with COPD exacerbation to the Internal Medicine Department of a Portuguese hospital during 1 year (cases). Controls are patients with COPD followed at a primary care center with no admission for exacerbation during the same period. Variables collected comprise demographic data, clinical history, treatment, laboratory information and primary care follow-up. Statistical analysis involves group comparison and multivariable logistic regression to identify independent factors associated with admissions classified as avoidable.

Results: The study is expected to identify a combination of clinical and contextual determinants that contribute to admissions labelled as avoidable. These findings may show that such admissions do not necessarily indicate shortcomings in primary care provision.

Discussion: By examining factors influencing admissions considered avoidable, this study may contribute to a more balanced understanding of performance indicators and highlight elements outside the control of primary care services.

Conclusion: The results may support a more equitable and accurate interpretation of avoidable COPD admissions within the Portuguese primary care evaluation framework. The study is at the moment ongoing and full results will be available for presentation at WONCA Europe 2026.

ID 660- The predictive value of socioeconomic position and migration background for complicated lower respiratory tract infections

Hanneke BORGDORFF [(1)] , Ernst VAN DOKKUM [(1)], Naomi KRAAIJENBRINK [(1)], Martijn SIJBOM [(1)], Saskia

LE CESSIE [2], Adriënne VAN DER SCHOOR [3], Leo VISSER [4], Cees VAN NIEUWKOOP [5]

(1) Department Pheg & Health Campus The Hague, Lumc, Leiden, Pays-Bas
(2) Department Clinical Epidemiology, Lumc, Leiden, Pays-Bas
(3) Academic Collaborative Centre For Public Health Lumens, Infectious Disease Control, Leiden And The Hague, Pays-Bas
(4) Department Lucid Subdepartment Of Infectious Diseases, Lumc, Leiden, Pays-Bas
(5) Haga Teaching-Hospital And Health Campus The Hague, The Hague, Pays-Bas

Context: Evidence on risk factors for a complicated course of lower respiratory tract infections (LRTIs) in primary care remains limited and often consensus-based. While population-based studies have linked socioeconomic position (SEP) and migration background to complicated LRTIs, their predictive value in primary care is still unclear. Consequently, these factors are not incorporated within current guidelines, which may contribute to health inequalities.

Objectives: The aim of this study was to develop a prediction model for complicated LRTIs in general practice, integrating established prognostic factors and assessing the added value of SEP and migration background.

Methods: Routine care data from Dutch general practices (n ≈ 750,000 adult patients) from 2014 to 2023, excluding the COVID-19 period, were linked to sociodemographic and hospital insurance claims data from Statistics Netherlands. Adults presenting with LRTI complaints were included. Complicated LRTI was defined as all-cause hospitalisation or mortality within 30 days. Logistic regression models were constructed with established prognostic factors; SEP and migration background were subsequently added. LASSO selection refined the prediction model, and goodness of fit, discrimination, and calibration were compared between models, with internal and external validation.

Results: We identified 186,094 LRTI episodes, of which 2.19% progressed to a complicated course within 30 days. Predictors included male sex, older age, chronic comorbidities, hospitalisation in the previous year, current oral corticosteroid use, recent antibiotic use, and a clinical diagnosis of pneumonia. Lower SEP was also associated with increased risk: after adjustment for established factors, patients in the lowest SEP category had an adjusted odds ratio of 1.46 (95% CI: 1.31–1.62) compared with the highest.

Discussion: Our findings highlight that socio-economic determinants play a significant role in infectious disease outcomes in primary care. Addressing these factors in prevention and clinical decision-making has the potential to reduce health inequities. However, the effectiveness, feasibility and acceptibility of incorporating SEP into guidelines and risk tools warrent further research.

Conclusion: Socioeconomic position is an independent predictor of a complicated LRTI course in primary care.

Corresponding author: Ernst Van Dokkum, e.d.van_dokkum@lumc.nl

ID 479- Epidemiology of RSV among adults in a POCT cohort: A Primary Care Observational Study in England across 2023–25 (ObservatARI)

Fatima BATOOL, Uy HOANG, Jose ORDONEZ-MENA, Jennifer RADIN, Andre ARAUJO, Xinchun GU, Xuejuan FAN, Ellya ENESCA, Elizabeth BUTTON, Simon DE LUSIGNAN

University Of Oxford, Oxford, Royaume-Uni

Context: Respiratory syncytial virus (RSV) is increasingly recognized as a significant cause of acute respiratory infections (ARI) in older adults. Its burden in primary care among adults aged 40+ remains poorly characterized due to limited testing.

Objectives: We aimed to describe the positivity, symptomatology and risk factors of RSV compared to COVID-19 and influenza A/B among patients presenting with acute respiratory infection (ARI).

Methods: Twenty-one practices within the Oxford-RCGP Research and Surveillance Centre (RSC) – the English sentinel surveillance network – used Cepheid GeneXpert point of care test (POCT) for multiplexed reverse transcription polymerase chain reaction to test nasopharyngeal swabs collected from patients aged 40+ with ARI between October

2023 and January 2025. Patients were included if they had a coded ARI within the preceding 10 days including: influenza-like illness (ILI), lower/upper respiratory tract infection (LRTI/URTI), and exacerbations of chronic lung disease. Patients were excluded if they did not have a coded ARI, an RSV positive test within past 28 days, or symptom onset >10 days prior to the visit.

Results: 4,320 patients were swabbed and after applying exclusion criteria 3,098 were eligible for analyses. Influenza A had the highest positivity (5.99%, 95% CI: 5.24-6.83), followed by COVID-19 (5.87%, 5.13-6.71), RSV (4.15%, 3.53-4.87), and influenza B (0.29%, 0.16-0.54). RSV positivity was highest among patients aged 60–74, and those residing in rural areas. Cough, breathlessness, and abnormal lung sounds appeared more prevalent among RSV cases. Influenza A was most common in patients with ILI (65.7%), RSV in those with LRTI (56.6%) and COVID-19 in those with either ILI (44.9%) and LRTI (44.9%).

Discussion: We estimated the positivity of RSV, COVID-19 and influenza among medically attended ARIs in adults aged 40+ in primary care in England.

Conclusion: Implementing RSV vaccination programs in older adults could help alleviate the burden of RSV in the community.

Research in Primary Care

ID 2225- What should be the content of a policy for the development of general practice and primary care research?

Hector FALCOFF [(1)], Dorien ZWART [(2)] , Juan Antonio LOPEZ RODRIGUEZ [(3)], Andree ROCHFORT [(4)]

(1) European Association Of Quality And Safety In General Practice-Family Medicine. Acronym Equip, Paris, France
(2) European Association Of Quality And Safety In General Practice-Family Medicine. Acronym Equip, Utrecht, Pays-Bas
(3) Semfyc, Madrid, Espagne
(4) European Association Of Quality And Safety In General Practice-Family Medicine. Acronym Equip, Dublin, Irlande

Context: The topic is particularly relevant in France, where, in 2025, under the auspices of the Ministry of Health, a working group was established to define a national policy for supporting and developing primary care research (PCR). The European General Practice Research Network published an important document entitled "Research Strategy for General Practice in Europe 2021." This work updates a previous one from 2009. The strategy proposes four general objectives : • define research priorities in general practice/family medicine ; • strengthen research capacity ; • develop and promote high standards in research practice ; • facilitate the knowledge transfer from research to clinical practice. The strategy is intended to serve as a basis for developing specific plans in each country, taking into account its characteristics, its specific needs, and its initial level of research capacity. The impact of the strategy can be measured in terms of: • capacity building ; • scientific productivity (dissemination of research results) ; • establishment of networks and collaborations • involvement of stakeholders, policymakers, and the public ; • improved health of citizens.

Objectives: - To identify what has been done in the countries of the workshop participants, and at what level (macro, meso, micro). - To identify obstacles, levers and success factors.

Teaching method and workshop: Participants will exchange ideas in small groups on PCR policies in their respective countries. Have the general objectives outlined above been translated into operational objectives and action plans ? If so, what is known about their impact? What barrier

Expected outcomes: At the end of the workshop, participants will be able to initiate a dynamic for developing a policy to support PCR, tailored to the needs of their country, and in partnership with other stakeholders.

Conclusion: In all European countries, healthcare systems face significant challenges. Finding solutions requires the development of primary care research policies based on internationally shared analysis of successes and failures.

Research in Primary Care

ID 2256- Empowering Dutch National Primary Care: Building Sustainable Research Infrastructures for Innovation and Knowledge Sharing

Marcia SPOELDER [(1)] , Henk SCHERS [(1)], Leo VAN ROSSUM [(2)], Suzanne SCHAVEMAKER [(2)], Edward WORTMAN [(2)]

(1) Radboudumc, Nijmegen, Pays-Bas
(2) Nederlands Huisarts Genootschap, Utrecht, Pays-Bas

Context: Within the Netherlands, we are performing a national collaborative project (2024-2027) to enhance the collaboration between the seven existing Practice-Based Research Network (PBRN) and the Dutch College of General Practitioners. A PBRN is a collaboration of primary care clinics and clinicians working with researchers to ask and answer real-world questions; essentially acting as "clinical labs" for primary care research. In recent years, regional primary care organizations have become increasingly active and visible. In this project, we explore how the former PBRNs can best collaborate with these more regionally organized stakeholders to gather more aggregated research questions from clinical practice.

Objectives: Within this workshop, we will reflect on our lesson's learned thus far and we hope to inspire and learn from other countries to execute comparable national innovation projects.

Teaching method and workshop: In the first 30 minutes we will take along the participants through our experiences and results thus far in this national collaboration project. We will present and focus on three main topics: Governance, Data infrastructure and Knowledge Dissemination (1

Expected outcomes: Attendees will learn the following; Governance: How to develop a national governance model with a clear coordination point to foster collaboration between the regional primary care networks. Data Infrastructure: How to create an integrate and stan

Conclusion: Attendees will be enriched with knowledge on how information is collected from the regions and aggregated at the national level, how this can be assessed, evaluated, discussed, and then returned to the regions. This applies, for example, to tools, working methods, and more formal matters such as contracts and agreements.

ID 1788- Building a national primary care data warehouse in France: early implementation in a European and global perspective

David DARMON [(1)] , Olivier SAINT LARY [(2)], Olivier CHANELIÈRE [(3)], Matthieu SCHUERS [(4)]

(1) Université Côte D'azur, Nice, France
(2) Université Versailles Saint Quentin, Paris, France
(3) Université Lyon 1, Paris, France
(4) Université Rouen Normandie, Paris, France

Context: Across Europe, the development of health data warehouses has accelerated to support research, quality improvement, and health system performance, notably in the context of secondary use of health data and cross-border interoperability. However, worldwild primary care (PC) data remain fragmented despite their role in population health. Internationally, PC data networks such as the Canadian CPCSSN and the UK CPRD have demonstrated the value of routinely collected PC data for learning health systems. In France, no national infrastructure previously aggregated routine general practice data. The Plateforme de Données en Soins Primaires (P4DP) was launched to address this gap through a publicly governed, secure, and interoperable PC data warehouse.

Objectives: To describe the governance model, technical architecture, and stakeholder engagement strategy of P4DP and report early implementation milestones and initial analytic outputs.

Methods: We conducted a descriptive mixed-methods study of the design and early implementation of P4DP. Governance was analysed

through document review and stakeholder mapping involving general practitioners, patient partners, researchers, and authorities. PC data were extracted from EHR and related systems, transformed using standardised terminologies, and stored in a secure cloud infrastructure compliant with GDPR. Interoperability relied on common data principles and standards. International collaborations informed governance and data quality frameworks.

Results: a multi-stakeholder steering committee was operational, with active patient partner involvement. The technical infrastructure was deployed, EHR connectors developed, and first data ingestion completed, including prescription data from more than 10,000 patients across pilot sites. Initial outputs included prototype dashboards addressing practice-level feedback.

Discussion: Early findings highlight that integrating PC into national and European health data ecosystems is feasible but requires governance models adapted to community-based practice, strong professional engagement, and alignment with international interoperability standards. Compared with international networks, P4DP illustrates how publicly governed infrastructures can emerge within the European regulatory context and contribute to globally connected learning health systems.

Conclusion: The P4DP early implementation demonstrates the feasibility of a national PC datawarehouse aligned with European and global health data ambitions. These results provide transferable lessons for countries seeking to strengthen PC research capacity and support internationally interoperable learning health systems.

ID 1697- Rapid Recruitment into a Primary Care Digital Therapeutic Trial Using a Direct-to-Patient Strategy: The RiSolve Study in XXX

Saravana Pandian BOOMINATHAN [1] , Laura O CONNOR [1], Geoffery W CUNDIFF [2], Brendan STAUNTON [3], Emma CARR [3], Ciara MATTHEWS [4], Gopavaram Laalasa REDDY [5], Andrew W MURPHY [6]

(1) Hrb-Primary Care Clinical Trial Network, University Of Galway, Galway, Irlande
(2) Amara Therapeutics, Galway, Ireland; University Of British Columbia Faculty Of Medicine,, Vancouver, Canada
(3) Amara Therapeutics, Galway, Galway, Irlande
(4) University Of Galway, Galway, Irlande
(5) Hrb-Clinical Research Facility Galway,university Of Galway, Galway, Irlande
(6) Hrb Primary Care Clinical Trials Network And Discipline Of General Practice, University Of Galway, Galway, Irlande

Context: Recruitment remains a major challenge in primary care clinical research, where traditional practice-based identification often results in slow enrolment and delayed study timelines. Direct-to-patient strategies are increasingly recognised as effective alternatives that broaden reach and reduce burden on primary care sites. RiSolve, a prospective remote study evaluating a prescription digital therapeutic for overactive bladder (OAB) in women, implemented a combined traditional and digital recruitment approach across XXX.

Objectives: To evaluate the feasibility, speed, and effectiveness of a direct-to-patient, multi-channel recruitment strategy for enrolling women with bothersome OAB symptoms into a fully remote primary care study.

Methods: RiSolve is a prospective, single-arm, fully remote study including women (≥18 years) with bothersome OAB symptoms. Recruitment combined paid Meta social-media advertising, Google search visibility, direct-mailing GP practices through the HRB Primary Care Clinical Trials Network XXX (PC-CTNI), in-practice posters and leaflets, liaison with two urogynaecology units, advertisement in local pharmacies and snowball advertising. Interested individuals were directed to review online participant information and study team contact details. Weekly metrics captured expressions of interest, invitations issued, responses, screenings, and consents. Descriptive analysis summarised recruitment volume and engagement patterns.

Results: Over 5 weeks, 208 expressions of interest were received, 204 (98%) via social media, with three from in-practice posters and one via GP referral. Sixty potential participants were screened, and 47 were enrolled (ages 43-78, median age 61). The mean recruitment rate was 9.4 participants per

week, indicating a rapid enrolment pace for an interventional primary care study in XXX using a direct-to-patient approach. Recruitment increased steadily over the 5-week period, indicating strong public engagement with targeted digital outreach.

Discussion: Direct-to-patient engagement substantially reduced reliance on GP-led identification and facilitated rapid enrolment. Social-media advertising was the primary driver of participation, demonstrating public receptivity to digitally delivered recruitment for women's health research.

Conclusion: The RiSolve study shows that rapid and efficient recruitment into a primary care digital-therapeutics trial is achievable using a direct-to-patient, social-media-enabled strategy. These findings support the feasibility of decentralised recruitment approaches in primary care trials, although further work is needed to confirm sample representativeness.

ID 1420- Exploring clinical audit as a tool in collaborative research approaches in general practice

Emma TONNER [(1)], Stephen WOOLFORD [(2)]

(1) University Of Leeds, Leeds, Royaume-Uni
(2) City St George's University, London, Royaume-Uni

Context: Clinical audits are widely utilized in general practice, varying from small-scale initiatives within individual clinics to comprehensive efforts embedded in research and quality improvement programs. Audits enable practitioners to reflect critically on their actions and identify opportunities for improvement and can also provide data for real life research. Audits' potential as a collaborative approach bridging clinical practice and research remains underexplored.

Methods: Session discussions will be introduced by brief presentations of audit projects in UK and Denmark general practice. In the UK, the Primary care Academic CollaboraTive (PACT) has built a network of over 1000 clinicians, delivering audit projects at scale which provide participants with benchmarked data for quality improvement while contributing to national research. The PACT project ('Why Test' study) collected data from >2,500 patients with recent blood tests in primary care. From Denmark, we will present two in-depth audits of patient trajectories: atrial fibrillation without anticoagulants and suspected familial hypercholesterolemia in high-risk hypercholesterolemia. These examples illustrate diverse methodologies, clinician-driven or researcher-led, and provide a foundation for participants to discuss scope, versatility, and early impact of collaborative audit approaches.

Originality: These networks and approaches are believed to be original and this is first international colloboration, comparing approaches and sharing best practice that we know of in Europe. This is designed by English and Danish practioners and reflects an ongoing c

Lessons learned and future implication: Different approaches will be explored and shared, including successess and challenges of creating a network of more than 1000 Primary Care staff who receive personalised feedback and contribute to national priorities and how a data-driven approach can be

Discussion: This interactive workshop aims to initiate dialogue on strategies to engage general practitioners beyond traditional academic environments in collaborative audit projects to inform a broader research agenda. The session concludes with an open discussion, encouraging participants to share experiences and insights for potential future collaborations. Participants will gain insights into the dual role of clinical audits, enhancing quality improvement in clinical practice and contributing meaningfully to general practice research.

Conclusion: Clinical audit and quality improvement, delivered through collobortative networks can be hugely powerful in creating effective and sustainable change in General Practice.

ID 447- From Data to Solidarity: Nivel-PCD as a Pillar for Liberté, Égalité, and Fraternité in Primary Care Research

Joost VANHOMMERIG, Karin HEK, Lotte RAMERMAN, Mariette HOOIVELD, Renee VELDKAMP, Carliene VAN DRONKELAAR, Lucy OVERBEEK

Nivel, Utrecht, Pays-Bas

Context: Nivel Primary Care Database (Nivel-PCD) is a nationwide infrastructure in the Netherlands that integrates longitudinal, pseudonymized data from general practitioners (GPs), out-of-hours services, and allied health professionals. With a coverage of 1.8 million registered patients in general practices and >69% of the population for urgent care, Nivel-PCD enables research on epidemiology, healthcare utilization, and quality of care.

Objectives: To describe the structure, coverage, and governance of Nivel-PCD as a national primary care data resource; to highlight the types of data collected and their potential for epidemiological and health services research; to outline strengths, limitations, and opportunities for linkage with other datasets; to inform researchers about access procedures and ethical considerations for using Nivel-PCD.

Methods: Nivel-PCD aggregates coded data from electronic health records across multiple primary care disciplines, such as GPs, out-of-hours GP services, physio-, exercise and speech therapists, and dietitians. Governance ensures privacy through pseudonymization, opt-out options, and strict adherence to GDPR. Data linkage with socioeconomic and secondary care sources supports comprehensive analyses. Researchers worldwide can access data under transparent governance protocols.

Results: Nivel-PCD has supported studies on disease surveillance, medication adherence, health inequalities, and policy evaluation. Its multidisciplinary scope fosters equity in research opportunities and informs improvements in care delivery. Examples include monitoring influenza trends, assessing socioeconomic disparities in out-of-hours care, and evaluating the impact of COVID-19 on healthcare utilization.

Discussion: Nivel-PCD promotes liberté through open access for bona fide researchers globally, enabling scientific freedom and innovation. It advances égalité by ensuring representative coverage across regions and demographics, reducing bias and supporting equitable health insights. Finally, it strengthens fraternité by fostering collaboration among GPs, allied health professionals, and researchers to advance a Learning Health System for the common good.

Conclusion: Nivel-PCD exemplifies how shared data infrastructures can unite stakeholders in primary care research, ensuring that knowledge generation serves all citizens equally and strengthens solidarity in healthcare. Future developments include leveraging artificial intelligence to enrich data quality and accelerate insights.

Rural

ID 1555- Complex unified approach for management of incontinence in rural setting

Serguei KISSELEV

Sheffield Medical Centre, Sheffield, Australie

Context: Urinary incontinence is a very common condition, affecting up to half of all women and a significant portion of older men, with major impact on quality of life. In rural communities, limited access to specialist care makes management challenging. At our medical centre in Tasmania, we introduced a structured program of Complex Unified therapy to provide a non-invasive, practice-based solution. Between 2018 and 2025, 91 patients both men and women of varying ages and comorbidities underwent 228 treatment courses.

Methods: Patients received either basic or maintenance courses. Outcomes were assessed at completion and during follow-up. A ≥50% improvement in bladder control was achieved in 62.73% of patients, including complete recovery in 6.59%. Less than 50% improvement noted in 23.68% and no improvement in 13.9%. Approximately half of patients sustained improvement for ≥18 months.

Results were compared with published benchmarks for surgical and conservative therapies.

Originality: Our outcomes exceeded typical conservative therapy results (40–60% improvement, 20–30% non-response) and approached surgical benchmarks for medium-term durability, without the risks of invasive procedures. This data demonstrates that our structured and un

Lessons learned and future implication: Strengths included accessibility, safety, and patient acceptability. Active sceening program was implemented. No specific selection criterias were applied. All procedures were adjusted according to patients tolerance. Limitations in need for repeated cour

Discussion: Rural primary care can deliver effective continence management with outcomes comparable to international benchmarks. Introduction of active screening program following structured therapy into everyday practice expands the role of general practitioners, enhances patient confidence, autonomy, and reduces inequities in access to care.

Conclusion: Primary care is able to provide positive outcomes across diverse populations. Our patients can achieve effective bladder control, gain functional and psychological improvement, return self-confidence. This program required minimal space, has affordable cost to establish and training available

ID 1352- Advancing primary care access for long-acting contraception- the role of task sharing

Wendy V. NORMAN, Enav ZUSMAN, Fatemeh KHORAMI, Laura SCHUMMERS

University Of British Columbia, Vancouver, Canada

Context: Access to long-acting contraceptives is limited in rural areas of Canada and many countries, due to the paucity of trained primary care inserters. In our context pharmacists are able to prescribe all contraceptives, and all are available without cost. Could the pressure on family physicians be reduced if pharmacists perform insertion of subdermal implants in the pharmacy?

Objectives: We aimed to understand pharmacist's perception of the potential feasibility, training needs, requirement for resources, readiness, and any barriers or facilitators, to implement sub-dermal implant insertion.

Methods: We recruited community pharmacists representing the range of geographic regions of the Canadian province of British Columbia for semi-structured interviews. Our thematic analysis used an inductive approach, developing overarching themes after identifying experiences and perceptions.

Results: Among the twelve participants we learned pharmacists have strong interest to provide implant insertions. They identified in-person training, staffing support, consultation spaces that are private, adequate funding, access to a booking system and increased public and clinician awareness and support as facilitators. We also learned that pharmacists see physical space constraints, potential workload, liability concerns, care pathways for removal, and the potential for resistance from physicians as potential barriers. Participants emphasized the importance of affordable certification programs with options for ongoing recertification and that training should ideally be integrated into pharmacy education and existing continuing education training platforms.

Discussion: We found pharmacists assessed this practice as feasible, with a range or requirements to support implementation identified, largely relating to training and supportive infrastructure.

Conclusion: Pressure on rural family physicians could potentially be relieved through task sharing of subdermal contraceptive implant insertions with pharmacists. Next steps will involve addressing regulatory, logistical, and interprofessional frameworks. Engaging pharmacists to support some primary care tasks has the potential to support family physicians in busy practice settings.

Corresponding author: Enav Zusman, enav.zusman@ubc.ca

ID 745- Strengthening Equity, Continuity and Community-Oriented Primary Healthcare through Structured Community Engagement in Rural Settings

Natalie DALY [1] , Carl DEANEY [2], Ellis VICTORIA [3], Jean DEANEY [4], Michelle DAFF [5], Stephanie KOLIANDRIS [3]

(1) Gpa, Louth, Royaume-Uni
(2) Gp, Louth, Royaume-Uni
(3) Practice Nurse, Louth, Royaume-Uni
(4) Ceo, Louth, Royaume-Uni
(5) Hca, Louth, Royaume-Uni

Context: Community engagement is central to the principles of WONCA Europe, supporting equity, continuity, participation and community-oriented primary care. Rural populations often face additional barriers to accessing services, including reduced transport options, socioeconomic constraints and variability in health literacy. This project evaluated how structured, proactive community engagement activities can strengthen primary healthcare delivery, empower local populations and enhance health outcomes.

Objectives: Examine how a structured programme of community engagement, including patient surveys, community-group attendance and collaboration with the Patient Participation Group (PPG), could enhance delivery, accessibility and responsiveness of primary healthcare services in a rural general-practice setting.

Methods: A mixed-methods approach was undertaken. Engagement activities: consultations with the PPG, attendance at multiple community groups, a patient survey assessing interest in interactive health-education sessions. Quantitative data were obtained from survey responses, while qualitative insights were generated from patient feedback during group sessions. Thematic analysis explored perceptions of accessibility, trust, preferred learning approaches and community priorities.

Results: Survey data showed high engagement, with 94.83% (n=477) consenting to participate. 80% expressed interest in attending interactive health-education sessions. The most requested topics were blood pressure, weight management and lifestyle change. Preferred venues were local village halls (74%), with a weekday session preferred by 90% of respondents. The age distribution indicated strong engagement among older adults (42% aged 56–69; 32% aged ≥70). Qualitative findings highlighted trust, continuity and a desire for practical, relatable education as key enablers of community participation. Barriers included limited confidence in managing health conditions and uncertainty about what services were available.

Discussion: Qualitative insights showed that trust, familiarity and relational continuity drive effective engagement, with community-based approaches perceived as more personal and less intimidating than practice-based ones. However, barriers such as low confidence and limited awareness of services highlight the need for ongoing, adaptable engagement. Early outcomes were positive, but evaluation was limited.

Conclusion: Meaningful, structured community engagement promotes trust, strengthens relationships and improves the responsiveness of primary healthcare. By involving communities as partners in the design and delivery of services, primary care can become more equitable, person-centred and sustainable. Community-based educational approaches offer a scalable model aligned with WONCA principles, particularly in underserved or rural contexts.

ID 243- Training Needs and Influencing Factors Among Rural-oriented General Practitioners in Chongqing, China: A Latent Profile Analysis

Xintao HUANG, Huisheng DENG

Huangxt@hospital.cqmu.edu.cn, Chongqing, Chine

Context: Rural-oriented general practitioners (GPs) are core grassroots healthcare workforce trained via China's "Rural-oriented Medical Education Project" to address rural physician shortages and improve primary care quality, requiring 6-year mandatory service. They face limited career development and low retention (only 16%). Targeted CME can

enhance professional identity and retention, but existing programs overemphasize clinical skills, misalign with practical needs, lacking systematic training needs assessment and factor analysis.

Objectives: Systematically assess CME needs priorities of rural-oriented GPs in Chongqing to identify key competency gaps; classify heterogeneous subgroups via Latent Profile Analysis (LPA); explore impacts of personal, professional, and family factors on needs types, providing evidence for targeted CME curriculum design and policy optimization.

Methods: A cross-sectional survey was conducted (July-August 2025) among 508 rural-oriented GPs in 38 Chongqing counties via stratified sampling based on economic, demographic, and geographical conditions. Validated Chinese HHTNA (high reliability, assessing skill importance/proficiency) and a demographic questionnaire were used. Data were analyzed with SPSS 29.0 (descriptive statistics, regression) and Mplus 8.3 (LPA).

Results: All 37 skills showed significant training needs ($p<0.001$), with Clinical Research and Evidence-Based Practice most urgent (mean difference 1.60), key gaps including paper writing and project design. LPA identified three subgroups: low (46.46%), medium (41.14%), high (12.40%) demand (high-demand group also needed Management and Organization). Higher title, monthly income ≥7000 CNY, and research engagement were negative predictors (OR>1.5); having one child was positive (OR=0.26-0.49).

Discussion: Rural-oriented GPs have widespread and heterogeneous training needs, with clinical research gaps mismatching current CME focus. Family responsibilities (e.g., childcare) divert energy, increasing needs; GPs with higher title/income have lower needs due to better resource access. A tiered, demand-driven CME system integrated with promotion incentives is needed. Limitations include self-reported data; future studies require objective assessments and longitudinal tracking.

Conclusion: Rural-oriented GPs in Chongqing have significant competency gaps, with Clinical Research and Evidence-Based Practice as top priorities. A tiered, demand-driven CME system integrated with promotion, salary incentives, and flexible learning (e.g., online courses) is needed to ensure equitable resource access, enhance competence and long-term retention, supporting primary healthcare sustainability.

ID 133- Bridging the Rural Gap: Economic Evaluation of Community First Responders and Access to Defibrillators in Out-of-Hospital Cardiac Arrest, Lincolnshire UK

Mehrshad PARVIN HOSSEINI

University Of Lincoln, Lincoln, Royaume-Uni

Context: Responsed time in Out-of-hospital cardiac arrest (OHCA) episodes remains a critical determinant of survival, with outcomes significantly poorer in rural areas due to delayed emergency medical service (EMS) arrival. In the UK, approximately one in four patients achieve return of spontaneous circulation (ROSC) by ambulance handover, yet fewer than one in ten survive to hospital discharge. Community First Responders (CFRs), trained local volunteers, provide early support and can respond to any medical emergencies to help ambulance services within Lincolnshire, UK. Access to defibrillators (ADs) also represent a potentially life-saving intervention in time-critical circumstances and proposed as critical interventions to bridge rural-urban gap in emergency care. However, evidence on their economic value and practical impact within the UK context remains limited.

Objectives: To evaluate the accessibility and effectiveness of CFRs and defibrillators in improving OHCA outcomes in rural Lincolnshire, and to assess their cost-effectiveness within National Health Syestem (NHS) policy frameworks.

Methods: A mixed-methods approach comprising: (i) a scoping literature review of AD-related quality-adjusted life year (QALY) evidence; (ii) analysis of anonymised data from East Midlands Ambulance Service (EMAS) and the Lincolnshire Integrated Voluntary Emergency Service (LIVES); and (iii) comparison of OHCA outcomes with and without CFR attendance. Key predictors included rurality, call category, clinical condition, age, sex, ethnicity, deprivation index, conveyance, and response times.

Results: CFRs attended 17.7% of OHCA episodes, arriving before EMS in 38% of cases. CFR attendance reduced mean response time to 7.45 minutes, compared with 9.19 minutes for ambulance crews. However, CFR attendance was not associated with significant improvement in ROSC or 30-day survival. This study economic modelling, informed by Smith et al. (2020), estimated incremental per-patient CFR programme costs of £203, while AD improves access but may exceed the £30,000 per QALY cost-effectiveness threshold, with estimated NHS costs of £22 million annually.

Discussion: These findings suggest that while CFRs reduce response times, survival benefits are limited and AD can provide cost-effective contributions to rural emergency care.

Conclusion: While CFR reduce response times, they do not appear to improve survival outcomes independently. Nevertheless, both CFR and AD interventions may represent cost-effective strategies when assessed within NHS thresholds, particularly in rural settings.

Safer sex

ID 1717- Why and how should we talk about sexuality with patients in general medicine?

Philippe ZERR [(1)] , Maximilian Gstrein HASSANALY [(2)]

(1) Cnge, Levallois Perret, France
(2) Cnge, Paris, France

Context: Sexual health concerns everyone, regardless of age or sexual orientation. In 2015, the WHO recommended training primary healthcare providers in sexual health knowledge and developing communication skills related to sexuality (World Health Organization. Brief Communication on Sexuality (BCS). Recommendations for a public health approach. WHO 2015. 70 p). In France, the High Council for Public Health (HCSP) has just published a report on sexual and reproductive health (HCSP High Council for Public Health. Sexual and reproductive health. HCSP information, no. 339 – April 26, 2016. 92p.). The HCSP proposes implementing a national sexual health strategy to ensure physical, emotional, mental, and social well-being related to sexuality from birth to old age for the entire population.

Objectives: Engage participants to train them to discuss sexuality in general practice. The workshop aims to enable physicians to discuss sexuality with patients easily and fluently. This requires understanding the medical circumstances that justify addressing sexuality, knowing how to use appropriate language, and knowing when to discuss it.

Teaching method and workshop: A group quiz, a list of keywords and situations justifying discussions about sexuality, and a debate in the room will clarify the topic. Practical examples will be illustrated by the three speakers to discuss the importance of screening for medication-rel

Expected outcomes: Participants should find it easier to discuss sexuality with their patients, thanks to the practice, ideas, and vocabulary provided by the group during the workshop.

Conclusion: Why and how should we discuss sexuality with adolescents and adults? Understanding the importance of this topic for the patient is essential to initiating discussions and making sexuality a topic easily addressed during consultations. Discussing sexuality with patients in primary care is a skill that can be learned.

Corresponding author: Philippe Zerr, docteurzerr@gmail.com

ID 1581- HIV Pre-exposure Prophylaxis: Issues and Determinants of Adherence. The Ad-PrEP Study

Angélique SAVALL, Menad SI MOHAND, Louise LEMAITRE

Department Of Education In General Practice, Saint Etienne, France

Context: In the context of persistent new HIV infections and evolving sexual practices associated with increased risk, pre-exposure prophylaxis (PrEP) has emerged as a key component of combination prevention strategies. Although its efficacy is well established, adherence in real-world settings remains a major challenge.

Objectives: To explore the determinants and barriers to PrEP adherence from the users' perspective.

Methods: This qualitative study was based on 13 semi-structured individual interviews with current and former PrEP users. Participants were recruited through purposive sampling on a voluntary basis. Data analysis followed a grounded theory approach.

Results: Daily dosing was the preferred regimen among participants. Adherence was supported by a sense of personal and collective safety, regular medical follow-up, and an improvement in sexual well-being. Conversely, stigma, social vulnerability, and the persistent taboo surrounding sexual health were major barriers contributing to treatment discontinuation.

Discussion: Identifying barriers to adherence, investing in sexual health, and normalizing PrEP use appear to be key levers for strengthening HIV prevention. The future of PrEP lies in a more personalized approach, tailored to users' individual trajectories and needs, in order to foster sustained and inclusive adherence.

Conclusion: PrEP fosters reassurance, autonomy, and sexual fulfilment for users when supported by stable, non-stigmatizing follow-up in primary care. Long-acting PrEP should be viewed as a complementary tool rather than a substitute for oral PrEP, whose relational and continuous nature remains essential to sustained engagement and equitable sexual health.

Corresponding author: Angélique Savall, a.savall@univ-st-etienne.fr

ID 1370- From Risk Categories to Sexual Behavior: Optimizing STI Screening and PrEP Protocols to Avoid Over-Diagnosis. Data from the AUSL-Reggio Emilia's "Spazio Sessualità e Salute" Primary Care Clinic.

Davide VALLE, Francesca BONVICINI, Gabriele GAZZANEO, Marina SPARANO, Valentina MENOZZI, Federico DAOLI, Carmen CASONI, Alessia ALDINUCCI, Ilaria CASTAGNI

Primary Care Department, Ausl-Irccs Reggio Emilia, Reggio Nell'emilia, Italie

Context: In the Reggio Emilia Local Health Authority (AUSL), the "Spazio Sessualità e Salute" (SSS) clinic of the Primary Care Department coordinates the sexually transmitted infections (STI) network and manages pre-exposure prophylaxis (PrEP) prescriptions, replacing the Infectious Diseases Department in this role.

Objectives: To characterize SSS users and identify determinants shaping infection risk perception among users and healthcare staff.

Methods: We conducted a descriptive analysis of testing and counselling data for new users enrolled from Jan 1 to Dec 31, 2024, and for users prescribed PrEP at least once from Jan 1, 2019, to Aug 31, 2025.

Results: In 2024, 533 new users were enrolled: 65.1% male (208 heterosexual, 142 MSM), 33.8% female and 1.1% transgender; mean age was 35 (range 17-78). Asymptomatic presentation was prevalent in MSM (70.0%) and women (66.8%), whereas heterosexual men were mostly symptomatic (54.8%). While ~86% of users received serological testing, MSM underwent multisite microbiological testing twice as often (~50%) as heterosexuals. Past STIs were more common in MSM (33.8%) than in heterosexual men (15.4%) or women (13.4%). Syphilis and Gonorrhoea prevalences were higher in MSM, while Chlamydia was higher in women (0.187) and heterosexual men (0.169). Coinfection rates were higher in MSM (4.1%). Among 198 PrEP users (89.9% MSM), 64.1% had a history of STIs, yet 65.7% received no new STI diagnoses during the study period.

Discussion: Asymptomatic Chlamydia and Gonorrhoea were detected almost exclusively in MSM. Coinfection rates in MSM dropped to levels comparable to heterosexuals (1.63%) when excluding asymptomatic cases of Gonococcal and Chlamydia trachomatis infections. Strict PrEP and MSM protocols require comprehensive screening even without symptoms. This leads to higher detection of asymptomatic infections, some of uncertain clinical significance, potentially overestimating MSM risk while underestimating risk in heterosexual groups where screening is less aggressive.

Conclusion: Prevalence differences often reflect testing disparities rather than behavioural risk alone. PrEP serves as a protective tool for high-risk users rather than merely facilitating condomless sex. Implementing counselling and screening based on specific sexual behaviours, rather than broad risk categories, could improve efficiency and support more equitable, non-stigmatising care. PrEP screening intervals should be reviewed to mitigate risk of over-diagnosis and over-treatment.

ID 1360- "Spazio Sessualità e Salute" AUSL-Reggio Emilia: an Integrated Primary Care Model to boosting HAV, HBV, and HPV Vaccination Coverage in PrEP Users and At-Risk Populations.

Davide VALLE, Francesca BONVICINI, Gabriele GAZZANEO, Marina SPARANO, Valentina MENOZZI, Federico DAOLI, Carmen CASONI, Alessia ALDINUCCI, Ilaria CASTAGNI

Primary Care Department, Ausl-Irccs Reggio Emilia, Reggio Nell'emilia, Italie

Context: Rising sexually transmitted infections (STIs) incidence and the introduction of pre-exposure prophylaxis (PrEP) demand new organisational strategies. In the Reggio Emilia Local Health Authority (AUSL), STI management is entrusted to the Primary Care Department, and the "Spazio Sessualità e Salute" (SSS) clinic coordinates the STI network. At SSS, vaccinations are actively offered to users in guideline-defined at-risk categories, and to users with comparable sexual behaviours (e.g., unprotected oral-anal sex with multiple partners), alongside test & counselling activities and PrEP prescription.

Objectives: To assess whether this integrated primary care model improves vaccination coverage in key populations, and to compare our coverage with published data.

Methods: We analyzed SSS vaccination reports (Jan 1, 2019–Aug 31, 2025), focusing on PrEP users during this period and new patients enrolled from Jan 1 to Dec 31, 2024.

Results: Annual vaccine doses (HAV, HBV, HPV) consistently exceeded new enrollments (e.g., 2023: 474 doses vs. 329 users). HPV doses doubled from 2019 (179) to 2024 (396), while HAV and HBV remained stable. Coverage increased across all 2024 cohorts (MSM, heterosexual men, women). Among MSM, coverage rose significantly from baseline: HAV (18.3% to 71.1%), HBV (72.5% to 81%), and HPV (16.2% to 90.1%). PrEP users showed similar gains: HAV (44% to 71.2%), HBV (84.8% to 95%), and HPV (36.4% to 85.9%). Among heterosexual men and women, coverage also improved: HAV from 10.1% and 15.9% to 19.7% and 26.2%, respectively, and HPV from 2.4% and 43.2% to 14% and 63.4%.

Discussion: The rise in HPV vaccinations reflects expanded eligibility for free doses and a decreasing male-to-female ratio among new users (from 3.49 in 2019 to 1.90 in 2025). Comprehensive counselling helps identify risk factors beyond assigned categories. Literature, including data from the Bologna STI centre, reports lower vaccination coverage (e.g., 41.3% for HPV among MSM), often due to Behavioural and Social Drivers (BeSD) barriers such as service fragmentation, access difficulties, lack of awareness, stigma and mistrust.

Conclusion: An integrated primary care model combining prevention, diagnosis and treatment facilitates user access, improves vaccine coverage from baseline, optimises STI management and can help to overcome BeSD barriers, supporting more equitable care for stigmatised high-risk populations.

ID 1339- The influence of partner attractiveness on condom use to prevent sexually transmitted infections among 18–25-year-olds.

Guillaume CONORT, Tiphaine HERAULT, Andréa MATHIEU

Département De Médecine Générale De L'université De Bordeaux, Bordeaux, France

Context: Sexually transmitted infections (STIs) can have a significant impact on sexual and reproductive health. Although condoms are an essential prevention tool, decisions about using them are often based on emotion.

Objectives: This study aimed to assess the link between attractiveness and condom use, and to identify characteristics of partners and relationships that are associated with condom use and perceived STI risk among young people in XXX.

Methods: A cross-sectional observational study was conducted from May to October 2025 among young people aged 18 to 25 living in XXX. Sociodemographic data and characteristics of partners and relationships during the most recent sexual encounter were collected using a self-administered questionnaire. Mixed models were used to identify factors associated with condom use and perceived risk of STI among partners.

Results: A total of 913 responses from 610 participants were analysed. Higher perceived attractiveness was associated with lower condom use (adjusted odds ratio = 0.83, p = 0.004) and a lower perceived risk of the partner having an STI (p < 0.001). Condom use and risk perception varied according to sexual practices, type of relationship, having multiple partners, beauty, trust, feelings and how long participants had known their partners (p < 0.01).

Discussion: Our results suggest that attractiveness has an independent effect on preventive behaviour. They confirm that the observed effect relates not only to intention, as demonstrated in previous studies, but also to self-reported behaviour. Furthermore, the factors actually associated with condom use differ significantly from those reported by participants as influential. These findings highlight the importance of incorporating emotional and subjective factors, particularly attraction, into sexual health prevention programmes for young people. However, the overrepresentation of women and students limits the generalisability of the results. Further qualitative research into attraction could provide a more in-depth exploration of this subjective concept and its influence on condom use decisions.

Conclusion: Partner attractiveness is negatively associated with condom use. Prevention strategies should take these emotional and relational factors into account to enhance the effectiveness of conventional cognitive and informational interventions.

ID 1018- Implementing a structured sexuality education intervention for adolescents in residential care: a family medicine approach

Catarina ALVES [(1)] , Rita AMARAL [(2)], Maria Francisca FREITAS [(1)], André FERNANDES [(1)], Sandra SANTOS [(3)], Viviana BARREIRA [(4)], Rita AMORIM [(1)], Carlos Franclim SILVA [(5)]

(1) Unidade De Saúde Familiar Horizonte, Unidade Local Saúde De Matosinhos, Matosinhos, Portugal
(2) Unidade De Saúde Familiar Aníbal Cunha, Unidade Local Saúde De Santo António, Porto, Portugal
(3) Unidade Cuidados Continuados Matosinhos, Unidade Local De Saúde Matosinhos, Matosinhos, Portugal
(4) Unidade De Cuidados De Saúde Personalizados Norte São Roque, Unidade De Saúde Local Entre Douro E Vouga, Oliveira De Azeméis, Portugal
(5) Unidade De Saúde Familiar Horizonte, Unidade Local Saúde De Matosinhos; Faculdade De Medicina Da Universidade Do Porto, Matosinhos, Portugal

Context: Sexuality education in XXX residential youth institutions is frequently inconsistent, despite the complex needs of the young people they support. A structured sexuality education intervention was therefore developed for two residential care institutions. This initiative aligns with the community mission of family medicine and primary care (PC), by promoting health literacy, reducing risk behaviours, and fostering health development in vulnerable populations.

Objectives: The primary objective was to evaluate the impact of a participatory sexuality education session on adolescents' attitudes toward sexuality using a validated instrument. Secondary objectives included identifying institutional needs and contextual factors that may support long-term, primary care-led health promotion strategies.

Methods: A mixed-methods design was adopted. In the qualitative phase, focus groups with multidisciplinary staff explored institutional contexts, priority themes, and perceived challenges related to sexuality education. These findings informed the adaptation of the educational sessions to the characteristics of each institution's population. In the quantitative phase, following each session, adolescents completed a validated instrument assessing attitudes across domains such as sexual health, relationships, consent, digital behaviour, and gender norms. Data was analysed to examine variations between institutions and age groups. The intervention was delivered by primary care (PC) professionals, reinforcing intersectoral collaboration with residential care settings.

Results: Qualitative analysis revealed a lack of structured sexuality education, variability in staff confidence, concerns regarding digital exposure, consent, contraception, emotional development, and cultural diversity, as well as strong openness to collaboration with PC professionals. Quantitative results included more positive and informed attitudes toward sexuality, improved risk perception, and increased willingness to seek guidance from professionals.

Discussion: The integration of qualitative contextual assessment with the validated instrument ensures that the educational content is tailored to each institution's needs. The involvement of PC professionals reinforces the discipline's role in promoting equity, strengthening intersectoral links, and delivering developmentally appropriate health education in vulnerable youth.

Conclusion: This study identifies important gaps in sexuality education within residential youth care and demonstrates the feasibility of implementing a structured, participatory intervention supported by PC. Findings will guide the development of a scalable, sustainable sexuality education programme embedded within PC practice.

ID 225- Closing the Gap in Female Diagnostics: An Adolescent Case of Missed STI Diagnosis and the Need for Gender-Sensitive Care

Belen TORRES PASTOR [(1)] , Irene CORTIJO VALENTIN [(1)], Manuela CABALLERO SANCHEZ [(1)], María Alejandra VELASQUEZ RODRIGUEZ [(1)], Claudia MORIYON MARTÍ [(2)], Maud Sekyirah YEBOAH BINEY [(2)]

(1) Primary Care Center Doctor Cirajas, Madrid, Espagne
(2) Primary Care Center Avenida De Aragón, Madrid, Espagne

Context: Sexually transmitted infections (STIs) are rising worldwide, particularly among adolescents, reflecting changing sexual behaviors and inconsistent barrier use. In women, these infections are often mild or asymptomatic, unlike men whose infections usually cause clear urethral symptoms, delaying diagnosis and increasing the risk of infertility or chronic pelvic pain. Recognizing these disparities is essential to improve gender equity in healthcare.

Methods: A 17-year-old female with no relevant medical history presented with a 5-day history of right lower quadrant pain, anorexia, and nausea. Laboratory results were normal, and abdominal ultrasound was inconclusive for appendicitis. She was discharged with analgesia. No pregnancy test was performed, and sexual history was not obtained. Twenty hours later, she returned to primary care with persistent pain. A new anamnesis, including pregnancy risk and recent sexual activity, revealed a recent unprotected encounter. A targeted gynecological examination, including bimanual pelvic assessment, showed cervical motion tenderness, raising suspicion for pelvic inflammatory disease (PID). She was referred to the gynecology emergency department and admitted. During hospitalization, Chlamydia trachomatis infection was confirmed, and her clinical course was favorable.

Originality: This case highlights the diagnostic gap affecting adolescent females with abdominal pain and the clinical value of cervical motion

assessment—a simple maneuver that can be performed in primary care to detect early pelvic infection.

Lessons learned and future implication: In young women, sexual history and pregnancy risk should be routinely assessed when evaluating abdominal pain. High suspicion for Chlamydia and possible gonococcal coinfection, combined with targeted pelvic examination and prompt empiric antibiotic therap

Discussion: STIs in women often present with mild or nonspecific symptoms, leading to misdiagnosis. In pelvic inflammatory disease Chlamydia trachomatis is the most frequent pathogen, often coexisting with Neisseria gonorrhoeae. Early empiric antibiotic therapy was initiated in our patient, preventing serious complications such as infertility, tubo-ovarian abscesses, and chronic pelvic pain.

Conclusion: In primary care, we already have most of the tools needed to raise clinical suspicion or establish an early diagnosis of STIs, making it our responsibility to maintain a high index of suspicion. Integrating these practices may reduce gender-related diagnostic disparities.

Seasons of change: motherhood and menopause

ID 2253- Menopause Care for Women with Mild Intellectual Disabilities

Kirsten BEVELANDER, Monique KOKS-LEENSEN

Radboudumc, Nijmegen, Pays-Bas

Context: Menopause is a significant life stage that can involve complex physical and psychological changes. For women with a mild intellectual disability (MID), these changes may be even more challenging due to communication barriers, limited health literacy, and fragmented care. Despite this, little is known about how these women experience menopause or receive treatment. Current clinical guidelines rarely address this group, leaving healthcare providers without clear strategies for tailored support.

Objectives: This study aims to explore how women with MID experience menopause, what support they receive, whether symptoms are recognized, and what barriers exist in accessing appropriate care. We also aim to identify gaps in clinical practice and outline priorities for future research and guideline development.

Methods: We use a qualitative design based on semi-structured interviews with three stakeholder groups: women with MID who are experiencing menopause, informal caregivers such as family members or support workers, and healthcare providers including general practitioners and specialists. Interviews focus on symptom recognition, treatment experiences, communication challenges, and decision-making processes. Data will be analyzed thematically to identify patterns and unmet needs.

Results: Preliminary results will be presented and discussed in detail.

Discussion: The absence of tailored guidelines and structured care pathways for women with MID during menopause creates inequities in health outcomes. There is an urgent need for research on symptom prevalence and accessible communication tools adapted to this population.

Conclusion: Menopause care for women with MID is an overlooked area in clinical practice. Developing inclusive guidelines and training for healthcare professionals is essential to ensure equitable, person-centered care.

ID 2244- Self-Experimentation in Nutrition and Heart Health During Menopause

Kirsten BEVELANDER, Julia VAN CALIS, Marjoleine LODEWIJK

Radboudumc, Nijmegen, Pays-Bas

Context: The Menofood project is a citizen science project, addressing real-world health questions by involving citizens in research. We investigate the relationship between nutrition, menopausal symptoms and cardiovascular health. Many women adjust their diets during menopause to relieve symptoms such as hot flashes, anxiety, and poor sleep, yet these changes may also impact heart health negatively. Despite this, little is known about what women actually do in practice. Many experiment extensively with their own health, often guided by conflicting advice. To address this gap, Menofood combines four complementary studies: a pragmatic literature review, a nationwide crowdsourcing study, a focus group study, and a cohort study. The project works with a community of over 800 women and 20 citizen scientists who actively contribute to research design, data collection, interpretation, and communication.

Objectives: This presentation focuses on the crowdsourcing and focus group study, which aimed to collect real-world experiences with diets, herbs, supplements, and hormones during menopause, identify patterns in self-management strategies, and uncover gaps between public health messaging and lived experiences.

Methods: A campaign was launched inviting women to share their experiences through an online platform. Participants described symptoms, dietary adjustments, and sources of information. Next, more in-depth focus groups were held.

Results: Findings reveal a wide range of approaches to managing menopausal symptoms through nutrition and complementary strategies. Women reported experimenting with specific foods, herbal remedies, and dietary supplements, often in combination with hormone therapy. Practices and motivations varied greatly, influenced by multiple and often conflicting information sources. These findings highlight the lack of clear, evidence-based guidance and the complexity of self-management strategies.

Discussion: Crowdsourcing proved effective for engaging a large, motivated community and generating rich qualitative data. Insights underscore the need for personalized, evidence-based guidance and demonstrate how participatory approaches can bridge research and practice.

Conclusion: The Menofood project illustrates the potential of citizen science to co-create knowledge that reflects both scientific evidence and lived experience. Beyond generating insights, this approach delivers a knowledge agenda that identifies priority areas for future research on nutrition, menopause, and cardiovascular health, informing clinicians about what patients are actually doing and where guidance is needed.

ID 2209- Correlation of The Diet Diversity with Osteoporosis in Elderly in Southeast of Iran

Fariba YADOLAHI, Hoda SHARIFI

Faculty Of Medicine, Zahedan University Of Medical Sciences, Zahedan, Iran, République Islamique d'

Context: Osteoporosis is a worldwide public health concern. Proper nutrition plays an important role in osteoporosis prevention and treatment.

Objectives: This paper aims to provide a correlation between dietary diversity score and osteoporosis in Iranian elderly and provide some recommendations for improvement.

Methods: We recruited 426 elderly aged 45–85 from southeast of Iran in this study. Dual-energy X-ray absorptiometry (DXA) was used for measuring the bone mineral density of lumbar vertebrae and femoral neck. Convenience sampling method was utilized to select the participants, which included two groups: case (n = 213) and control (n = 213). Data was collected using demographic and information questionnaires, a valid 147 item food frequency questionnaire, and a physical activity questionnaire. Statistical analyses were conducted using SPSS-26, and p-values less than 0.05 were deemed to be statistically significant.

Results: The mean ± standard deviation of dietary diversity score (DDS) was lower in participants with

osteoporosis cases than in control ($p < 0.001$). After adjusting the confounding variables, the risk of osteoporosis had an inverse relationship with the diversity score of vegetable (OR = 0.17; 95%CI: 0.06–0.24), bread and cereal (OR = 0.31; 95% CI: 0.04–0.75) and fruit (OR = 0.36; 95%CI: 0.26–0.49) ($p < 0.05$). Nevertheless, no visible correlation was seen between the triads of DDS, dairy and meat diversity score, and osteoporosis.

Discussion: The southeast of Iran, bordering Pakistan and Afghanistan, suffers from poor nutrition and low socio-economic status. This is the first study to demonstrate the correlation between osteoporosis and food diversity in southeastern Iran. Elderly people with a low food diversity score have limited access to healthcare services. This region faces an increasing burden of non-communicable diseases, including osteoporosis, in the near future.

Conclusion: The study found the significance of addressing osteoporosis risk with the diversity score of food in older adults. Healthcare policymakers and administrators can use these findings to identify and alleviate dominant factors contributing to osteoporosis.

ID 1997- Mothers' knowledge, attitudes, and practices regarding infant feeding after the earthquake in a disaster area: the case of XXX

Raziye Sule GUMUSTAKIM, Zeynep Yasemin TAS

Kahramanmaraş Sütçü İmam University Faculty Of Medicine, Kahramanmaraş, Türkiye

Context: Disasters pose significant health risks, particularly for vulnerable populations such as mothers and infants. In emergency settings, continuous access to breast milk—the safest and most reliable source of infant nutrition—is frequently disrupted by psychological stress, lack of privacy, inadequate hygiene conditions, loss of social support, and the uncontrolled distribution of breast-milk substitutes.

Objectives: This study aimed to examine infant feeding-related challenges experienced by mothers residing in a container city following the magnitude 7.4 earthquake that caused widespread destruction in XXX.

Methods: This analytical cross-sectional study employed a mixed-methods design. In the quantitative phase, a questionnaire including sociodemographic characteristics and the 17-item Infant Feeding Attitudes Scale (IFAS) was administered to 115 mothers living in the container city. In the qualitative phase, in-depth interviews were conducted with 15 mothers selected through purposive sampling, with interview durations ranging from 6 to 32 minutes. Quantitative data were analyzed using DataBeeg 1.0, and qualitative data were analyzed with MAXQDA version 24.

Results: Most participants reported substantial difficulties in accessing appropriate breastfeeding spaces after the disaster, as well as experiencing cracked or painful nipples and limited access to healthcare services. The majority of mothers received infant formula as humanitarian aid; however, key safety criteria such as expiration dates and age appropriateness were often overlooked. IFAS scores were significantly associated with the number of children ($p<0.05$) and were positively correlated with maternal age ($r=0.268$) and the age of the first child ($r=0.222$). Qualitative analysis identified three main themes: post-disaster experiences, infant feeding experiences, and expectations. Predominant challenges included poor hygiene, lack of privacy, and heightened anxiety. Although breast milk was widely perceived as healthy and protective, many mothers reported a perceived reduction in milk supply due to stress.

Discussion: The findings are consistent with the existing literature indicating that post-disaster conditions negatively affect breastfeeding practices through both environmental and psychological stressors. Furthermore, the widespread and uncontrolled distribution of infant formula poses additional risks by undermining breastfeeding practices and increasing the likelihood of unsafe feeding.

Conclusion: These findings underscore the need for comprehensive, coordinated, and sustainable mother and baby-centered interventions within disaster management strategies.

ID 755- Determinants of Early Breastfeeding Cessation in Primary Care: The STOPALMA Prospective Study

Romane GRZESKOWIAK

Aix-Marseille Université, Marseille, France

Context: Breastfeeding provides major health benefits, yet France reports comparatively short breastfeeding duration. Understanding early determinants is essential, particularly in primary care.

Objectives: To identify factors associated with early breastfeeding cessation and examine the involvement of general practitioners (GPs) in breastfeeding support.

Methods: We conducted a prospective observational study between October 2024 and March 2025 in two French maternity units, including one accredited by the Baby-Friendly Hospital Initiative (BFHI). Breastfeeding women ≥18 years completed structured questionnaires at discharge, three months (M3) and six months (M6). Primary outcome was breastfeeding duration; secondary outcome was maternal satisfaction. Additional items described healthcare professionals consulted and breastfeeding-related experiences.

Results: Among the 128 included women, 46.9% were still breastfeeding at three months and 28.1% at six months. Among those who stopped before six months, the median duration was 12 weeks (IQR 7.5–16). Prenatal breastfeeding information had been received by 62% of participants, almost exclusively from midwives (91%). Only 7% of women who sought help for breastfeeding difficulties consulted a GP, and those followed exclusively by GPs tended to breastfeed for a shorter period (median 6 vs 12 weeks, p=0.13). Breastfeeding pain was reported by nearly half at M3 and was associated with lower maternal satisfaction (5.9 vs 7.3; p=0.014) and a shorter, although non-significant, duration (8 vs 12 weeks, p=0.062). Exposure to judgmental remarks was strongly associated with lower maternal satisfaction, and women still breastfeeding at six months were statistically less exposed to such remarks than those who had weaned earlier. Giving birth in a BFHI-accredited maternity was associated with longer duration (23 vs 10 weeks; p=0.005). Maternal satisfaction with breastfeeding support was also associated with perceived support (p=0.040), yet 33% reported a weaning that was imposed or not aligned with their initial intentions.

Discussion: Institutional and relational environments influenced breastfeeding outcomes. BFHI-accredited care supported longer duration, while judgmental remarks, insufficient support and breastfeeding pain were linked to poorer outcomes. GPs were rarely involved, and exclusive GP follow-up tended to be associated with shorter duration.

Conclusion: Better integration of general practitioners into structured postpartum care may help sustain breastfeeding and reduce premature weaning.

ID 108- General Practitioner perspectives on implementation of osteoporosis prevention in perimenopausal women

Rim GHALI, Barbara HUNTER, Jo-Anne MANKSI-NANKERVIS, Jasna ALEKSOVA

University Of Melbourne, Department Of General Practice And Primary Care, Melbourne, Australie

Context: Osteoporosis carries a high economic and social disease burden, affecting one in three women and one in five men over the age of 50 worldwide. Worldwide, osteoporosis is estimated to affect 200 million women. The rate of bone mineral density (BMD) decline accelerates dramatically in perimenopause such that almost half of all women will have osteopaenia or osteoporosis following menopause. Osteoporosis prevention involves arresting BMD decline primarily through lifestyle modifications, such as structured exercise programs and optimisation of nutrition and calcium intake. However, osteoporosis incidence in women continues to rise.

Objectives: To explore perspectives of xxx General Practitioners of osteoporosis prevention in perimenopausal women and associated barriers to preventative care advice and implementation.

Methods: 15 General Practitioners (GPs) were interviewed on their experience of osteoporosis prevention in perimenopausal women using semi-structured interviews based on the theoretical domains and COM-B frameworks. Interviews were recorded, de-identified and analysed using and inductive and deductive approach utilising NVivo software.

Results: Barriers to implementation of osteoporosis prevention consultations with perimenopausal women include competition from multiple presenting complaints, complexity of guideline recommendations and restrictions on rebates for screening investigations. GPs who prioritised preventative care actively screened for and discussed preventative health activities with women prior to menopause. GPs reported varied comfort with complex guideline recommendations and variable grades of associated evidence.

Discussion: This study explores the barriers to implementation of osteoporosis prevention in primary care. The findings demonstrate areas for improvement of preventative health strategies for women, with potential behaviour change for practitioners. Health system changes to address gaps in funding for screening programs in women in this age group are also potential sites of improvement and we will reflect on a new xxx health assessment strategy in perimenopause that may serve to address this gap.

Conclusion: GP reported barriers to osteoporosis prevention in perimenopausal women provide insight into potential areas to address to optimise clinical practice. Increased health service prioritisation of preventative care and increased access to DEXA scans for at-risk populations warrant future exploration.

ID 94- The role of social support in menopausal symptoms

Snežana KNEŽEVIĆ

Academy Of Applied Studies Polytechnic, Belgrade, Serbie

Context: Menopause transitions significantly impact women's quality of life through vasomotor, psychological, and physical symptoms affecting daily functioning and well-being. While social support is widely recognized as beneficial for various health outcomes, its specific role in managing menopausal symptoms remains inconsistent across research literature, with conflicting findings regarding its effectiveness for different symptom types.

Objectives: This literature review evaluated current evidence on how social support influences menopausal symptom management, assessed the effectiveness of social support interventions compared to lifestyle modifications, and identified barriers to implementation in primary care settings.

Methods: A literature search was conducted in PubMed, Cochrane Library, and Web of Science databases for peer-reviewed studies published from 2015 to 2024. Inclusion criteria required original research examining quantifiable relationships between social support measures and validated menopausal symptom assessments. Data extraction focused on symptom types, measurement methods, and intervention outcomes. Twenty-three studies met the inclusion criteria.

Results: Analysis revealed that participation in structured social groups correlated with significantly reduced depressive symptom severity ($p<0.001$) and improved quality-of-life scores in four longitudinal studies. However, a rigorous nine-year prospective cohort study found no significant association between social support and vasomotor symptom frequency or intensity after adjusting for confounding variables (OR=1.08). Stress significantly exacerbated vasomotor symptoms (21% increased frequency), but social support failed to demonstrate a buffering effect in multivariate models. Complementary lifestyle interventions showed superior evidence for symptom amelioration compared to social support alone, particularly whole-food plant-based diets, regular physical activity, restorative sleep, substance avoidance, and stress reduction techniques. Primary care implementation barriers included time constraints (81%) and difficulties facilitating behavior change (89%).

Discussion: Evidence suggests social support contributes meaningfully to psychological well-being and quality of life during menopause but demonstrates limited direct effects on vasomotor symptoms. The superiority of lifestyle interventions highlights the importance of multi-component approaches in menopausal care.

Conclusion: Primary care protocols should integrate validated social support assessments alongside evidence-based lifestyle interventions for comprehensive menopausal management. Future research should develop optimized integrated models and evaluate practical implementation strategies for primary care settings.

Second sex, first care: women's health

ID 2098- Integrated Community Women's Health Hubs: Improving Access, Equity and Efficiency

Aamena SALAR [(1)] , Susheelwant RANDHAWA [(1)], Naresh RATI [(1)], Vincent SAI [(2)], Mina GUPTA [(2)], Nina JHITA [(2)]

(1) Modality Llp, Nationwide, Royaume-Uni
(2) Modality Partnership, Nationwide, Royaume-Uni

Context: Women's health services across the UK are often fragmented, with long waits, limited community provision and high reliance on hospital-based care. National gynaecology waiting lists have risen sharply, leaving many women waiting far beyond acceptable timeframes. Deprived and ethnically diverse patients face barriers including travel distance, limited appointment availability and lack of culturally tailored support. We established integrated community-based women's health hubs to address these gaps. Hubs aimed to consolidate assessment, diagnostics and treatment into local, accessible settings while reducing unnecessary secondary-care referrals and improving equity of access.

Objectives: To evaluate the impact of a community women's health hub on: Access to women's health services Waiting times and referral patterns Equity of reach among deprived and diverse populations System efficiency and ability to manage demand closer to home

Methods: A service evaluation was undertaken across multiple community hub sites. Activity data, waiting times, triage outcomes, diagnostic throughput and patient experience were reviewed. Workforce, governance and community-engagement activities were analysed to understand enablers of service effectiveness.

Results: The service covered a population of more than 100,000, predominantly deprived and ethnically diverse, women. 800–1,000 appointments delivered per month across multiple community locations. Average waits were <34 days, significantly shorter than national averages. Electronic triage was completed within five days, with an 8.6% onward referral rate, indicating strong management within primary care. The service s. 79% would recommend the service, 34% higher than outpatient comparators. The model reduced unnecessary referrals, increased community diagnostic capacity, and supported consultant oversight while shifting care closer to home. Service responsiveness compared favourably with national outpatient benchmarks, offering substantially shorter waits for assessment and treatment.

Discussion: Integrated community hubs can substantially improve access, streamline pathways and reduce reliance on hospital services. Multidisciplinary teams, accessible locations and flexible hours supported equity and demand management. Workforce development and consultant-supported governance were key to safety and sustainability.

Conclusion: A community women's health hub model can deliver faster, fairer and more comprehensive care, particularly for underserved groups. This approach offers a scalable model for improving women's health outcomes, relieving pressure on secondary care and may inform international efforts to modernise primary care.

Corresponding author: Aamena Salar, aamena.salar@nhs.net

ID 2097- Integrated Community Women's Health Hubs: Improving Access, Equity and Quality in Primary Care

Aamena SALAR [(1)] , Susheelwant RANDHAWA [(1)], Naresh RATI [(1)], Vincent SAI [(2)], Mina GUPTA [(2)], Nina JHITA [(2)]

(1) Modality Llp, Nationwide, Royaume-Uni
(2) Modality Partnership, Nationwide, Royaume-Uni

Context: Women often face long waits, fragmented pathways and limited access to timely gynaecological care. Many services traditionally operate within overstretched hospital settings with significant backlogs and systemic access barriers for disadvantaged patients. Primary care teams sought to improve access to women's health support by developing a community-based model that offered earlier intervention, reduced pressure on secondary care and improved accessibility.

Methods: An integrated community women's health hub model was established across multiple accessible primary care sites. Clinics were delivered by multidisciplinary teams including GPs with extended roles, nurses with specialist training and visiting secondary care clinicians. As demand increased, workforce development became essential; primary care staff undertook structured postgraduate training, competency frameworks and supervised practice to expand local capability. Co-design sessions with patients highlighted the need for welcoming environments and accessible locations. The model emphasised responsive delivery, with clinics adapted according to patient feedback, DNA rates and local transport considerations. Strengths included reduced travel burden, shorter waits and a consultation style aligned with primary care values—time for shared decision-making, explanation and support. Limitations included initial workforce capacity, requiring investment in GPwER and specialist nurse development to sustain growth.

Originality: Unlike traditional hospital-centric pathways, this model relocated women's health services into familiar, community settings while maintaining high-clinical-quality. The hub structure integrated primary and secondary care expertise, creating a seamless pa

Lessons learned and future implication: Common themes in patient feedback emphasised convenience, supportive environments and a more personal consultation style. The model demonstrated that equity improves when services are brought closer to home. Future phases will focus on increasing diagnost

Discussion: The experience showed that community-based women's health services can reduce reliance on secondary care, improve patient experience (79% patients would recommend) and address waiting lists (average waits <34 days).

Conclusion: An integrated primary care-based women's health hub model delivered 800-1000 appointments per month, improving access, equity and quality while offering a scalable, sustainable framework for modern women's health services internationally.

ID 1931- Impact of Gender Norms on Women's Care Pathways: From Sexist Biases to Medical Violence

Angelina PACE

Faculté De Médecine De Strasbourg, Strasbourg, France

Context: Although healthcare systems promote equality and universal access to care, women's care pathways remain permeated by sexist violence rooted in gender stereotypes. These biases can infiltrate everyday clinical encounters and lead to discrimination, loss of trust and, in some cases, medical violence. While research on obstetric and gynecological violence has expanded in recent years, medical violence experienced by women across healthcare settings remains insufficiently explored, particularly from the perspective of primary care.

Objectives: To describe and analyse forms of medical violence linked to gender stereotypes as experienced by women throughout their care pathways.

Methods: A qualitative study was conducted in 2020-2021 using twenty semi-structured interviews with adult French-speaking women. Participants were recruited via social media and snowball sampling. Interviews explored experiences of care across different medical settings. Data were analysed using a phenomenological thematic

approach, with double coding and triangulation to enhance analytical rigor.

Results: Analysis led to the development of a "pyramid of medical violence," ranging from the trivialization of sexism to explicit forms of violence embedded in rape culture. Intermediate levels included derogatory remarks, sexist discrimination in research and clinical practice, reification of patients and deprivation of autonomy. Participants frequently reported a sense of dispossession of their identity, body and healthcare decisions. These experiences were linked to societal injunctions surrounding "femininity," internalized sexist norms and normative control over reproductive health. Consequences included resignation, avoidance of male healthcare providers and, in some cases, renouncement of medical care. Conversely, some women developed coping strategies based on solidarity, peer support and empowerment.

Discussion: Findings are consistent with existing literature and highlight medical violence as a systemic phenomenon rather than the result of isolated individual behaviors. Limitations include potential selection bias related to voluntary participation, as well as recall and social desirability biases. However, the qualitative design allowed for in-depth exploration of lived experiences that remain largely invisible in clinical practice.

Conclusion: Gender stereotypes significantly shape women's care pathways and can generate forms of medical violence. Raising awareness among healthcare professionals, particularly in general practice, is essential. Integrating training on gender bias, intersectionality and patient participation into healthcare education appears necessary to foster compassionate, trust-based care environments.

ID 1606- Assessment of the quality of care of lesbian cisgender women in general practice in France

Léa COSSON

Université Paul Sabatier, Toulouse, France

Context: Lesbian cisgender women face specific health issues and barriers to healthcare access which can affect their quality of care.

Objectives: This study set out to assess the quality of care of lesbian cisgender women in general practice in France using the PCPCM (Person Centered Primary Care Measure). Secondary objectives aim to assess the influence of coming out to their practitioner and the invisibilization of lesbian identity by the health care provider on the quality of care.

Methods: A quantitative, observational, cross-sectional study based on a self-administered online questionnaire aimed at french cisgender lesbian women over the age of 18. Quality of care was assess using the PCPCM (Person Centered Primary Care Measure). A Comparison with a representative sample of French general population was done using a Wilcoxon test.

Results: 1000 lesbian cisgender women fully responded to the questionnaire. They experience lower quality of care compared to the sample of the general French population (2,70 vs 2,96, $p < 0,05$). Lesbian cisgender women who have come out to their practitioner report better quality of care than those who have not (2,81 vs 2,45, $p < 0,05$). Lesbian cisgender women whose identity is invisibilized have worse quality of care than those whose identity is acknowledged after coming out (2,39 vs 3,07, $p < 0,05$).

Discussion: Our findings are consistent with American, Australian, and British studies reporting a poorer self-perceived health status among lesbian women.These results are explained by the minority stress framework, which includes negative medical experiences and fears of discrimination.Conversely, American, Canadian, and Israeli papers highlight that physician awareness of a patient's sexual orientation is associated with improved use of the healthcare system, particularly regarding preventive strategies.

Conclusion: Cisgender lesbian women experience poorer healthcare quality, as assessed by the PCPCM, compared with the general French population. Coming out to one's physician improves

healthcare quality for french cisgender lesbian women, provided that this information is integrated into the clinical encounter to adapt communication and patient management accordingly. Further research is needed to develop recommendations for general practitioner to prevent lesbian invisibility.

ID 574- Developing a sexual health empowerment intervention for migrant women in primary care: a participatory multi-methods study

Lisa OUANHNON [(1)] , Julie DUPOUY [(1)], Marie-Anne DURAND [(2)], Aurore PALMARO [(1)]

(1) Dumg De Toulouse, Toulouse, France
(2) Université De Lausanne, Toulouse, France

Context: Migrant women experience major inequalities in sexual health, linked to social vulnerability and barriers to care. Although GPs are often their main point of contact with the health system, existing sexual health interventions are rarely adapted to primary care. They also tend to be heterogeneous, seldom grounded in empowerment principles, and rarely designed with migrant women themselves.

Objectives: To co-develop a primary care intervention to enhance migrant women's empowerment in sexual health, using a participatory and multi-step process.

Methods: We used three complementary approaches: a systematic review of sexial health empowerment interventions for migrant women; a Photovoice qualitative study with purposive sampling and phenomenology-inspired thematic analysis; and a consensus method (Nominal Group Technique) with migrant women, GPs and social workers. This methodology placed women's perspectives at the centre, with professionals contributing to feasibility and implementation in primary care.

Results: Across all steps, women expressed a need for accessible information, supportive communication, and recognition of their migration trajectories, vulnerabilities, and experiences of violence. The systematic review revealed gaps (especially around sexual violence, consent and care navigation) and highlighted the effectiveness of culturally adapted multimodal approaches. Photovoice showed women's willingness to become active agents of their health and to transmit knowledge within their communities. The NGT identified shared priorities: clear GP–patient dialogue, linguistic mediation, support for administrative navigation, simple educational tools, and opportunities for collective learning and peer support.

Discussion: This participatory multi-method design generated co-constructed priorities to guide the development of an adapted ENVOL intervention. Strengths include the integration of three complementary methods and the central involvement of migrant women, supported by professionals to ensure feasibility. A key limitation is the locally recruited sample, which may limit generalisability.

Conclusion: This multi-method participatory process provides a strong foundation for developing an adapted intervention in primary care. By mobilising coordinated care structures such as MSPs and CPTS, and integrating emerging roles including health mediators, this approach may strengthen access to sexual health support for migrant women. Ultimately, such an intervention has the potential to reduce sexual health inequalities and offer a transferable model for community-centred, empowerment-based primary care interventions.

ID 448- Underuse, overuse, and guideline-based use of cervical cancer screening: Social disparities in temporal screening trajectories in the French CONSTANCES cohort

Jeanne SASSENOU, Laurent RIGAL

Université Paris-Saclay, Paris, France

Context: The Pap test has been an important part of women's medical care for 40 years. Its utilization

over time allows us to study both under- and over-screening.

Objectives: Our objective is to study the trends over time in each woman's screening status while simultaneously examining both its underuse and overuse in France.

Methods: This study analyzes data from the CONSTANCES cohort, a general-purpose epidemiologic cohort designed to study a wide range of health problems in the general population. Inclusion in this cohort began in 2012 and concluded in 2021. Our final sample included 55,141 women. We used sequence analysis methods to characterize trajectories of cervical cancer screening use for each woman. We then obtained 3 clusters of sequences. We performed bivariate analyses by comparing variables of interest according to each woman's cluster membership.

Results: This study divides screening into 3 groups: a group of overscreened women who are socially advantaged, in good health and followed by a gynaecologist, a second group of underscreened women who are socially less advantaged, have less frequent gynaecological check-ups and are in poorer health, and an intermediate group up-to date. Our study shows that 70.7% of our sample was screened more often than necessary according to the guidelines for at least some periods of this study. Once a woman "adopted" a screening rhythm, it appeared to continue over time.

Discussion: Starting screening is therefore a decisive stage: it determines what follows. In our work, more than half the women in the overscreened group had seen a gynecologist. These results indicate that gynecologists play a role in overscreening.This raises questions about health care professionals' lack of adherence to guidelines. Indeed any guidelines may conflict with the principles of professional independence and of the freedom to prescribe — both fundamental principles of medical practice in France. The frequency at which Pap tests should be performed is not well known by women.

Conclusion: Our results showed an unequal distribution of social, demographic, and health characteristics across screening patterns. The majority of our sample was screened more often than necessary according to the guidelines then in effect.

ID 1993- Importance of a comprehensive approach in prevention and control of new tobacco and nicotine products use among adolescents and young adults

Joana MATOS BRANCO [(1)] , Sara GAMBOA MADEIRA [(2)], Francisco SANDE NOGUEIRA [(3)], Pedro FERREIRA SOUSA [(4)]

(1) Usf Águas Livres, Uls Amadora Sintra, Lisboa, Portugal
(2) Usf Serra Mãe, Uls Arrábida, Setúbal, Portugal
(3) Usf São João Evangelista Dos Loios, Uls São José, Lisboa, Portugal
(4) Usf Almonda, Uls Médio Tejo, Torres Novas, Portugal

Context: Tobacco use remains one of the leading preventable causes of morbidity and mortality worldwide. In recent years, the increasing consumption of new tabaco and nicotine products, such as heated tobacco products, electronic cigarettes and nicotine pouches, has raised particular concern among adolescents and young adults. These products are often perceived as less harmful, contributing to earlier initiation, dual use and sustained nicotine dependence. Primary care, particularly family medicine, plays a central role in prevention, early identification and intervention, requiring a comprehensive and age-adapted approach.

Objectives: To highlight the importance of a comprehensive, multidisciplinary and preventive approach to tobacco and new nicotine product use among adolescents and young adults, emphasizing the role of family medicine in health promotion, risk reduction and behavior change.

Methods: Narrative review of the literature combined with clinical experience from primary care practice and intensive smoking cessation counseling, focusing on epidemiology, determinants of use, health impacts, and effective preventive and therapeutic interventions targeting adolescents and young adults. Evidence-based strategies implemented in family medicine settings were analyzed, including brief interventions, motivational

interviewing, family involvement and community-based actions.

Results: The literature demonstrates a growing prevalence of new nicotine product use among young populations, often associated with misinformation, social influence and targeted marketing. Evidence supports that comprehensive interventions — integrating individual counseling, family engagement, school and community involvement, and public health policies — are more effective than isolated actions.

Discussion: In primary care, brief opportunistic interventions, non-judgmental communication, and tailored prevention strategies improve awareness, reduce initiation and support cessation. Addressing psychosocial factors and comorbid risk behaviors is essential for long-term effectiveness.

Conclusion: A comprehensive approach to the prevention and control of tobacco and new nicotine product use among adolescents and young adults is essential. Family physicians are uniquely positioned to intervene early, promote health literacy and coordinate preventive strategies across individual, family and community levels. Strengthening training, resources and integrated policies in primary care is crucial to reduce nicotine dependence and its long-term health consequences.

ID 2194- How can primary care support adolescents who smoke? A literature review of communication-based interventions

Eren YANIK, Rumeysa KAYACAN, Ikbal Humay ARMAN

Department Of Family Medicine, School Of Medicine, Istanbul Medipol University, Istanbul, Türkiye

Context: Tobacco use, including cigarette smoking and electronic cigarette use, often begins during adolescence and remains a major preventable cause of morbidity. Despite regular contact with adolescents and their families, primary care settings frequently miss opportunities to identify and address youth smoking and vaping due to communication barriers, confidentiality concerns, and time constraints.

Objectives: To synthesize the literature on communication-based strategies used in primary care to identify, prevent, and address smoking and vaping among adolescents.

Methods: We conducted a narrative literature review using a structured search of PubMed, including studies published between 2010 and 2025. Search terms combined adolescents, smoking or vaping, primary care, and communication-based interventions. Quantitative, qualitative, and mixed methods studies relevant to family medicine practice were included, while studies conducted exclusively outside primary care settings or without a communication component were excluded. Two reviewers independently screened and synthesized eligible studies, with a third reviewer providing oversight and resolving discrepancies.

Results: A total of 17 studies were included. Four key themes emerged. First, routine tobacco screening in primary care often under detects electronic cigarette use, highlighting the need for confidential and adolescent focused approaches. Second, brief communication strategies delivered by primary care clinicians, such as motivational interviewing, were feasible and more consistently implemented than referral-based interventions. Third, family focused communication influenced adolescent smoking behaviours, particularly in households with parental smoking. Fourth, digital and blended interventions linked to primary care visits showed promise in improving adolescent engagement. Findings should be interpreted considering heterogeneity across study designs and potential publication bias.

Discussion: Adolescent smoking and vaping are shaped by communication dynamics between adolescents, caregivers, and primary care clinicians. Strengthening communication within this triad may improve early identification and support timely intervention in primary care.

Conclusion: Primary care can support adolescents who smoke or vape through confidential screening, brief counselling delivered by clinicians, family focused communication, and integration of digital tools. Communication based strategies offer

practical and scalable opportunities for prevention and early intervention in routine primary care practice.

ID 1751- What Should Family Physicians Know About Vaping and EVALI? A Scoping Review

Dilan BARAN [(1)] , Melike MERCAN BASPINAR [(1)], Ibrahim SARBAY [(2)], Ismail SARBAY [(3)], Okcan BASAT [(1)], Mustafa CALIK [(4)]

(1) Department Of Family Medicine, University Of Health Sciences, Gaziosmanpasa Training And Research Hospital, Istanbul, Türkiye
(2) Department Of Emergency Medicine, University Of Health Sciences, Gaziosmanpasa Training And Research Hospital, Istanbul, Türkiye
(3) Department Of Thoracic Surgery, Demiroglu Bilim University, Istanbul Florence Nightingale, Istanbul, Türkiye
(4) Department Of Emergency Medicine, University Of Health Sciences, Gaziosmanpaşa Training And Research Hospital, Istanbul, Türkiye

Context: Smoking cessation services face the challenge of vaping being perceived as “not smoking,” a misconception for which youth lungs pay the price and which drives EVALI (e-cigarette or vaping product use–associated lung injury).

Objectives: To map and synthesize the existing evidence on youth vaping–related EVALI with a primary care and family medicine perspective.

Methods: A scoping review following PRISMA-ScR guidelines used an AI-based platform to analyze recent, diverse evidence on EVALI. Searches in Scopus, PubMed, and DergiPark yielded 519 records, with 71 English-language studies from 2019 to 2025 included. These studies, comprising observational, clinical, epidemiological, review, and case series reports, focused on EVALI outcomes in adolescents and adults using e-cigarettes or vaping products. Study selection employed systematic Boolean search strategies, and results were synthesized descriptively and thematically.

Results: Most studies were conducted in high-income countries, mainly the United States(n = 46), England(n = 12),and Türkiye(n = 4). Publication numbers peaked in 2020(n = 30) and 2021(n = 17) before declining after2022.The evidence base was largely driven by public health institutions, led by the Centers for Disease Control and Prevention (CDC) (n = 11), medicine (n = 7),and pediatrics (n = 7),while general practice was minimally represented(n = 1).The mean number of authors per publication was 8.03 ± 7.47 (IQR: 7),reflecting predominantly large,multi-author research teams.Thematic analysis identified eight major themes.The dominant theme was exposure to ENDS and vaping, including nicotine and THC/cannabis use and inhalational exposure to chemical constituents such as vitamin E acetate.Clinical presentation and disease severity ranged from acute lung injury and ARDS to hypoxia,ICU admission, prolonged hospitalization, and mortality.Diagnostic imaging frequently reported chest CT findings, particularly ground-glass opacities, with bronchoscopy and bronchoalveolar lavage used in selected cases. Additional themes included outbreak-driven epidemiology,adolescents and young adults as key risk groups, diagnostic overlap with COVID-19,psychosocial influences on vaping behaviors,and treatment strategies primarily based on supportive care and corticosteroids.

Discussion: EVALI represents a missed prevention opportunity rather than solely a tertiary-care diagnosis, highlighting the critical role of family medicine in early identification through routine vaping assessment in adolescents.

Conclusion: Ask early.Advise clearly.Prevent EVALI in primary care.

ID 1343- The Effectiveness of Breathing Exercises as a Stress-Reduction Method During the Smoking Cessation Process

Gokce ISCAN [1], Güzin ZEREN ÖZTÜRK [2] , Ilknur DEMIR [2], Saliha Büşra AKSU [2], Seçil ARICA [3], Ayşe Didem ESEN [3]

(1) Kütahya Health Science University, Kütahya, Türkiye
(2) 1 Health Science University Şişli Hamidiye Etfal Training And Research Hospital Şişli/istanbul/turkey, İstanbul, Türkiye
(3) 2prof. Dr. Cemil Taşçıoğlu City Hospital Şişli/istanbul/turkey, İstanbul, Türkiye

Context: Smoking cessation is often accompanied by withdrawal symptoms, increased perceived stress, and difficulty maintaining abstinence. Non-pharmacological interventions such as breathing exercises are increasingly used to support individuals during this critical transition, yet their contribution to stress reduction and cessation success remains insufficiently studied. Understanding their potential value may strengthen behavioral support strategies used in primary care smoking cessation services.

Objectives: This study aimed to evaluate the effectiveness of structured breathing exercises in reducing perceived stress during the early phase of smoking cessation and to determine whether these exercises contribute to smoking cessation success at one month.

Methods: This prospective study included adults aged 18–65 years who presented to smoking cessation clinics between April and July 2019. Sociodemographic characteristics, the Fagerström Test for Nicotine Dependence, and baseline Perceived Stress Scale (PSS-14) scores were recorded. PSS was reassessed at the first week, second week, and first month. Participants were categorized into two groups based on whether they regularly practiced the recommended breathing exercises. Within-group changes in stress levels were analyzed using paired statistical tests. Between-group comparisons and one-month cessation outcomes were assessed using chi-square tests.

Results: Breathing exercises were particularly effective during the first week, when withdrawal symptoms are most intense. The rapid reduction in perceived stress supports the use of simple, low-cost breathing techniques as an adjunct in early cessation. However, the lack of difference in cessation outcomes suggests that stress reduction alone may not independently determine cessation success. The imbalance in baseline stress levels and short follow-up period may have influenced results.

Discussion: Breathing exercises were particularly effective during the first week, when withdrawal symptoms are most intense. The rapid reduction in perceived stress supports the use of simple, low-cost breathing techniques as an adjunct in early cessation. However, the lack of difference in cessation outcomes suggests that stress reduction alone may not independently determine cessation success. The imbalance in baseline stress levels and short follow-up period may have influenced results.

Conclusion: Breathing exercises reduced perceived stress during the early stages of smoking cessation but did not increase one-month cessation success. Larger, longer-term randomized studies are needed to clarify their potential contribution to sustained abstinence.

ID 1144- Factors associated with smoking susceptibility among high school students in Southern Greece: FreshAir4LifeGR

Ioanna TSILIGIANNI [1] , Dimitrios VAVOULAS [1], Antonios CHRISTODOULAKIS [1], Theodoros KRASANAKIS [1], Antonia ARAVANTINOU-KARLATOU [1], Sevasti PERAKI [1], M. J. J. Rianne VAN DER KLEIJ [2], Faraz SIDDIQUI [3], Izolde BOULOUKAKI [1]

(1) University Of Crete, Heraklion, Grèce
(2) Leiden University Medical Center, Leiden, Pays-Bas
(3) University Of York, York, Royaume-Uni

Context: Experimentation with smoking during adolescence has been linked to an increased likelihood of nicotine dependence, often persisting in adulthood.

Objectives: To assess students' susceptibility to smoking and to analyze associated factors.

Methods: A cross-sectional study was conducted from April to June 2025. A convenience sample of 638 students aged 12-16 years was selected from 6 schools. Data was collected using a structured questionnaire including sociodemographic, social/environmental and personal variables. The

Expanded Susceptibility to Smoking Index (ESSI) was utilized for non-smoking students to identify those at risk of starting smoking cigarettes and related products, with higher scores indicating higher susceptibility to smoking. Regression analysis was used to examine the factors associated with smoking susceptibility.

Results: Of the 638 participants, 431 (68%) had never tried tobacco, 199 (31%) had tried tobacco products, and 95 (15%) had smoked them in the previous 30 days. Among the non-smokers, 50% and 51% presented medium–high ESSI scores for cigarettes and e-cigarettes, respectively, and 11% presented medium–high ESSI scores for nicotine pouch use. A higher ESSI score for cigarette smoking was associated with older age (OR=1.460,95%CI=1.223-1.742,p<0.001), household exposure to smoking (OR=1.637,95%CI=1.085-2.468,p= 0.019), second hand smoke in public outdoor places (OR=2.019,95%CI=1.285-3.175,p=0.002), having friends who smoke (OR=2.221,95%CI=1.399-3.527,p<0.001) and receiving an offer to smoke within the last 30 days (OR=3.188,95%CI=1.137-8.935,p=0.027). A higher ESSI score for e-cigarettes was associated with older age (OR=1.374,95%CI=1.158-1.629,p<0.001) household exposure to smoking (OR=1.909,95%CI=1.219-2.990, p=0.005), second hand smoke in public indoor places (OR=1.736,95%CI=1.158-2.603,p=0.008), having friends who smoke (OR=2.307,95%CI=1.524-3.493,p<0.001) and receiving an offer to smoke within the last 30 days (OR=2.511,95%CI =1.169-5.396,p=0.018). A higher ESSI score for nicotine pouches was associated with male gender (OR=3.131,95%CI=1.590-6.164,p<0.001) and inversely associated with the perception that nicotine pouches were likely to have an effect on health (OR=0.074,95%CI=0.019-0.280,p<0.001).

Discussion: A significant number of students who have not tried tobacco have some degree of susceptibility to smoking, positively associated with older age, smoking among family members and friends, and exposure to second-hand smoke.

Conclusion: Policymakers could utilize our findings to develop more targeted prevention programs by considering the impact of the social environment and intrapersonal factors on smoking susceptibility.

Corresponding author: Ioanna Tsiligianni, i.tsiligianni@uoc.gr

ID 383- Healthcare providers' knowledge, attitudes and practices on smoking cessation intervention in the Northern Cape

Chika EGENASI [(1)] , Lizwe MUZA [(2)]

(1) University Of The Free State South Africa, Bloemfontein, Afrique du Sud
(2) Robert Mangaliso Sobukwe Hospital, Kimberley, Afrique du Sud

Context: Healthcare providers (HCPs) play a central role in supporting smokers to quit through behavioural counselling and pharmacological interventions. Evidence shows that smokers achieve higher quit rates when assisted by trained professionals. However, the level of HCPs' knowledge, attitudes and counselling skills related to smoking cessation in the study area remains unclear.

Objectives: To assess the knowledge, attitudes and practices (KAP) of HCPs regarding smoking cessation intervention strategies in the Sol Plaatje district, Northern Cape. Setting: Thirteen primary healthcare clinics within the Sol Plaatje Local Municipality, Kimberley, Northern Cape.

Methods: A descriptive, cross-sectional analytical study was conducted among healthcare workers in these facilities using a structured questionnaire.

Results: Of the 165 eligible HCPs invited, 156 completed the questionnaire. Over half (53.9%) were unaware of the South African tobacco cessation guidelines, although 87.2% recognised the importance of counselling patients about smoking and its role in quitting. Most respondents lacked knowledge of the pharmacological treatments recommended for tobacco dependence in South Africa. While 89.7% agreed that smoking cessation counselling is an essential part of their role, fewer than half reported arranging follow-up for patients attempting to quit.

Discussion: Smoking cessation counselling and pharmacological treatment by healthcare providers

(HCPs) are essential for helping smokers quit. This study found that many HCPs had limited knowledge of smoking cessation guidelines and pharmacological options, despite recognising the importance of counselling and its effectiveness. While HCPs understood key health risks of smoking, including its impact on pregnancy and tuberculosis, overall knowledge remained poor. Major barriers identified included a lack of training, inadequate access to guidelines, limited community support resources, and insufficient educational materials. Smoking among HCPs further hindered cessation efforts. Strengthening training and guideline implementation is critical to improving smoking cessation support.

Conclusion: Significant gaps exist in HCPs' knowledge, attitudes and practices relating to smoking cessation. These findings highlight the need for strengthened continuing education and improved dissemination of national smoking cessation guidelines.

ID 323- Understanding tobacco and e-cigarette use among university students: a cross-sectional study

Kamer Billur YÜCEL ÖZDEN [(1)] , Ayşe Gülsen CEYHUN PEKER [(2)]

(1) Republic Of Türkiye Ministry Of Health Kağızman District Health Administration, Kars, Türkiye
(2) Faculty Of Medicine, Ankara University,, Ankara, Türkiye

Context: Tobacco addiction remains a preventable global public health problem. In recent years, growing concern has emerged regarding the increasing use of electronic cigarettes (e-cigarettes) among young people.

Objectives: This study aimed to investigate the prevalence of tobacco and e-cigarette use among university students, their willingness to quit, their awareness of available professional counselling support, and their knowledge related to e-cigarettes.

Methods: This cross-sectional study was conducted between March and June 2024 at a public university in Turkey with participation of 1144 students. Stratified and cluster sampling methods were used. Data were collected via face-to-face questionnaires assessing sociodemographic characteristics, tobacco use behaviours, attempts to quit, the Fagerstrom Test for Nicotine Dependence, and 14 e-cigarette knowledge statements. Informational leaflets on cessation support and e-cigarette harms were provided to participants following the survey

Results: Overall, 40.6% reported current use of any tobacco product and 24.3% reported e-cigarette use; among cigarette smokers, 74.4% had low/very-low dependence. Although 72.8% wished to quit, only 36.9% knew how to access medical counselling and 22.3% had received quit advice in the past year. In multivariable analyses, higher academic year, male gender, and lower-perceived-economic-status were associated with greater odds of tobacco use, while female gender and studying in the Faculty of Medicine were associated with lower odds of tobacco use. E-cigarette use was primarily motivated by flavour, curiosity, and, to a lesser extent, smoking cessation.

Discussion: This study revealed that, despite the sales ban in Turkey, exposure to e-cigarettes has rapidly increased among university students and multi-product tobacco use is widespread. Although most users were willing to quit, they were unaware of available professional support, highlighting the need to improve access to cessation services. These findings emphasize the importance of campus-based interventions, including expanding smoke-free policies, strengthening access to counselling, and ensuring routine cessation advice in student health clinics

Conclusion: Tobacco product use remains widespread among university students, with a growing preference for new-generation products such as e-cigarettes. However, low nicotine dependence levels and high willingness to quit represent a valuable intervention opportunity. Comprehensive university-based programs focused on prevention, awareness, and smoking cessation support are essential to promote healthy lifestyle behaviours in young adults.

(10) Academic Gp Registrar & Visiting Research Fellow, University Of Leeds / Bradford Teaching Hospitals Nhs Trust, Leeds, Royaume-Uni

Context: Social prescribing (SP) connects people to community activities and services to address practical, social and emotional needs. Digital platforms are increasingly used to support referral, and case management and data sharing. Artificial intelligence (AI) tools, such as predictive models, recommender systems, natural language processing, and conversational agents, may further support identification, matching, follow-up, and evaluation. However, there is no international overview of how AI and advanced digital tools are currently used in real-world SP initiatives, and what outcomes, equity implications, and implementation issues are reported.

Objectives: To map and categorise AI and digital health applications used in SP internationally, describe contexts and target populations, summarise reported outcomes and implementation considerations, and identify knowledge and methodological gaps.

Methods: We will conduct a scoping review reported in accordance with PRISMA-ScR. We will include SP initiatives in any country and care setting that uses digital tools across the pathway (case finding, referral, triage, matching, follow-up, monitoring, or evaluation). Eligible sources will include quantitative, qualitative, and mixed-methods studies and implementation/process evaluations published between 2000 and 2025 in English, Portuguese, Spanish, Turkish, or French. We will search MEDLINE, Embase, Web of Science Core Collection, Scopus, and Google Scholar using a predefined strategy combining controlled keywords. Two reviewers will independently screen and extract data, resolving disagreements by consensus or a third reviewer. Tools will be classified as AI-enabled, rule-based, or non-AI digital infrastructure. We will summarise evidence descriptively (country, setting, population, technology type and pathway stage), develop a practical taxonomy and pathway-stage map linking technologies to outcomes (process, wellbeing/clinical, service use, economic and equity-related), and synthesise implementation findings thematically, focusing on barriers, facilitators and ethical issues (privacy, transparency, interoperability, workforce readiness and digital exclusion).

Results: The review process is ongoing, and the results will be presented at the congress.

Discussion: This review will clarify current practice and identify where evidence is concentrated or absent, supporting more consistent evaluation and safer adoption.

Conclusion: An international map of technology-supported social prescribing will inform primary care teams, link workers, and decision makers on effective and equitable design and implementation.

ID 1689- An exploration of psychoeducation and health companions support through social prescribing in improving seniors' mood - a mixed methods pilot study

Hui Li KOH, Yi Xuan Shannon GOH, Poay Sian Sabrina LEE, Yu Cong Eugene CHUA

National Healthcare Group Polyclinics, Singapore, Singapour

Context: Subsyndromal depression (SSD) is highly prevalent among older adults yet remains underrecognised and undertreated. Despite evidence that early intervention may prevent progression to syndromal depression, there is a lack of community and primary care services for seniors with SSD, as most mental health services are diagnosis-dependent.

Objectives: This study aims to develop and evaluate a 12-week community-based intervention programme for seniors with SSD, comprising of psychoeducation sessions and social prescription by health companions. We hypothesised that the intervention programme would be aceptable to the seniors with SSD, reducing their feelings of loneliness and anxiety, while increasing their depression literacy and general well-being.

Methods: This is a mixed-methods study design, combining standardised questionnaires with in-depth interviews to explore participants' outcomes and experiences. Quantitative measures assessed depression (PHQ-9), anxiety (GAD-7), loneliness (UCLA Loneliness Scale v3), well-being (WHO-5), disability (WHODAS 2.0), depression literacy (D-Lit), and health-related quality of life (EQ-5D-5L), alongside sociodemographic and utilisation data on psychological service. Participants aged 55 years and above with SSD (PHQ-9 score 5–9) were recruited via convenience sampling from polyclinics.

Results: Fifteen participants were recruited, of whom nine completed the 12-week intervention, all assessments, and interviews. Pre-post intervention scores showed reductions in median scores in depression (7 to 6), anxiety (4.9 to 4.3), and loneliness (39.8 to 36.2), alongside improvement in health-related quality of life (EQ-5D-5L VAS: 78 to 80). Conversely, median depression literacy decreased (10 to 9) and disability scores increased (5 to 7). Qualitative findings indicated that participants valued small-group, in-person psychoeducation for its human connection, relatability, and practical materials that supported understanding and coping strategies.

Discussion: This pilot study may show positive feedback from the participants and improvement in participants' mood but conclusions are limited by the small sample and high attrition. Unexpected changes in depression literacy and disability suggest the need to refine the programme content. Further research with larger sample is needed to confirm its effectiveness, understand reasons for dropout, and optimise the intervention.

Conclusion: Overall, these findings highlight the potential of a community-based intervention for seniors with subsyndromal depression, while underscoring the need for larger, more robust studies to refine the programme and confirm its effectiveness.

ID 1078- Utilization of Link Working in Social Prescribing: Results from a multi-centre randomised-controlled feasibility trial in Germany

Niklas JESKE [(1)] , Hendrik NAPIERALA [(1)], Stephanie ROLL [(2)], Weronika GRABOWSKA [(3)], Julia UCAR [(3)], Wolfram HERRMANN [(1)]

(1) Charité – Universitätsmedizin Berlin, Corporate Member Of Freie Universität Berlin And Humboldt-Universität Zu Berlin, Institute Of General Practice And Family Medicine, Charitéplatz 1, 10117 Berlin, Berlin, Allemagne
(2) Institute For Biostatistics And Informatics In Medicine And Ageing Research, Rostock University Medical Center, Ernst-Heydemann-Str. 8, 18057 Rostock, Rostock, Allemagne
(3) Charité – Universitätsmedizin Berlin, Corporate Member Of Freie Universität Berlin And Humboldt-Universität Zu Berlin, Institute Of Social Medicine, Epidemiology And Health Economics, Charitéplatz 1, 10117 Berlin, Berlin, Allemagne

Context: Social Prescribing (SP) is an innovative approach to support patients with psychosocial health-related problems through the implementation of a new referral pathway from general practitioners (GPs) to link workers. Link workers consult with the patients and connect them to existing social activities and resources based on the patients' individual needs. So far, there are no studies exploring the utilization of SP in XXX.

Objectives: The objective is to determine the utilization of the offered link working, including number and duration of consultations, form of delivery, no-show rate, recommended social activities and resources.

Methods: Data were collected as part of a multi-centre, 2:1 randomized controlled feasibility trial aimed at patients aged 18 years or older presenting with one or more psychosocial problems at one of nine GP offices in XXX and XXX, XXX. Link working (intervention group) was tested against treatment as usual plus a brochure listing social activities and resources (control group). The utilization of link working for participants in the intervention group was analysed descriptively.

Results: In total, 234 participants (62% female, mean age 57 years, SD = 20) were recruited into the trial. 123 participants were randomized into the intervention group, out of which 114 participants (92.7%) had at least one link working consultation. Preliminary results show that participants had a median of 2 consultations (IQR 1-3, range 1-7) and only 5 participants (4.4%) had more than 5 consultations. The average consultation lasted 40 minutes. Regarding the mode of delivery, 80.4% of consultations took place in person at the GP office, 14.3% via telephone and 5.3% as home visits. Participant no-shows accounted for 18% of scheduled consultations. A broad range of social activities and resources were recommended, e.g. counselling, care and social support services, and recreational activities.

Discussion: The offered link working services were taken up well by the intervention group. In most cases, a maximum of five consultations were sufficient to deliver link working. Consultations were mostly delivered in person at GP offices.

Conclusion: The results expand the understanding of link working utilization and delivery and provide practical information to plan future SP interventions and evaluations.

ID 570- Adapting Social Prescribing to the Needs of People in Potentially Vulnerable Situations: A Co-Creation Process

Philip OESER [(1)] , Simon HÖRMANN [(1)], Alan Vinicius ASSUNÇÃO-LUIZ [(2)], Maria J. MARQUES [(2)], Sónia DIAS [(2)], Moa HALLER [(3)], Stéphanie BAGGIO [(4)], Lene Gissel RASMUSSEN [(5)], Sine AGERGAARD [(5)], Wolfram HERRMANN [(1)]

(1) Charité-Universitätsmedizin Berlin, Berlin, Allemagne
(2) National School Of Public Health, Nova University Of Lisbon, Lisbon, Portugal
(3) Universität Bern, Bern, Suisse
(4) Université De Lausanne, Lausanne, Suisse
(5) Aalborg Universitet, Aalborg, Danemark

Context: Social Prescribing (SP) aims to address social problems in primary care by linking medical services of General Practitioners (GPs) with social support services through a Link Worker (LW). Although existing evidence shows SP can improve wellbeing, SP has not been specifically tailored to meet the needs of people in potentially vulnerable circumstances.

Objectives: To adapt SP to the needs of three groups: a) lesbian, gay, bisexual, transgender, intergender, queer (LGBTIQ) persons, b) first-generation migrants and refugees, and c) older adults living alone.

Methods: The co-creation process followed an adapted framework by Hawkins et al. (2017). In phase one, SP manuals and protocols were reviewed, and workshops with each target group were conducted to develop case vignettes. In phase two, these vignettes formed the basis for co-production workshops that identified adaptations to core SP components, including recruitment strategies, GP and LW training, and considerations of inclusion and equity. In phase three, Local Advisory Boards (LABs) were convened in 10 hubs, comprising representatives from all three groups and GPs. These LABs reviewed the proposed adaptations for local feasibility. Their feedback was combined with earlier findings from earlier phases to derive final to produce final recommendations,

which were then refined and endorsed in a consensus conference with all hubs and stakeholder representatives.

Results: Across co-creation hubs, participants identified barriers to accessing SP. LGBTIQ participants emphasized the need for visibly safe practice environments, including respectful handling of self-identifications and pronouns. Refugees and first-generation migrants described language barriers as the central obstacle and recommended low-threshold explanations and culturally competent LWs. Older adults living alone stressed the importance of overcoming psychological and physical barriers through communication and flexible contact options. Across all groups, participants recommended sensitivity training for practice teams and LWs, and tailored approaches that strengthen trust and social participation.

Discussion: The co-creation process provides important insights into how SP can be tailored to the specific needs and lived realities of the target groups.

Conclusion: The resulting adaptations offer valuable guidance not only for the three groups but also for other populations facing similar vulnerabilities. The next step is to evaluate these tailored interventions in a European randomized controlled trial.

ID 1003- Walking the walk: social prescriptions for movement, nature, and belonging improve health

David SABGIR [(1)] , Julia HOTZ [(2)]

(1) Walk With A Doc, New Albany, États-Unis
(2) Solutions Journalism Network, New York, États-Unis

Context: Social determinants, inactivity, and isolation contribute to chronic disease, yet traditional healthcare often focuses solely on medical interventions. Social prescribing clinician-led referrals to non-medical community-based activities offers a novel approach to improving physical, mental, and social health. This report presents two complementary models: physician-led walking groups and structured social prescribing programs, demonstrating measurable health outcomes across diverse populations.

Methods: Author 1 and Author 2 implemented programs where clinicians referred patients to community activities promoting movement, social connection, and nature exposure. One model, physician-led walking groups, provided low-impact, supervised physical activity with medical oversight. Another model, structured social prescriptions in community settings, connected patients to cycling, swimming, and other activities tailored to individual needs. Outcomes included clinical indicators (e.g., blood pressure, hemoglobin A1c), medication reduction, mental health improvement, and participant adherence.

Originality: Physician-led community movement programs are novel in primary care and distinct from UK-style social prescribing. Combining medical supervision with social and environmental engagement offers a unique framework for sustained behavior change. This dual-mo

Lessons learned and future implication: Programs showed improvements in lifestyle-related disease outcomes, mental health, and patient self-efficacy. Clinicians also reported reduced burnout. Key lessons include the importance of structured referral pathways, accessible activities, and integrat

Discussion: These interventions illustrate practical, low-cost strategies to address chronic disease beyond pharmaceuticals. By fostering social belonging, encouraging physical activity, and exposing patients to restorative environments, primary care clinicians can deliver holistic, patient-centered care. The dual model underscores the value of clinician engagement in both direct activity leadership and referral coordination.

Conclusion: Social prescriptions and physician-led walking programs improve health outcomes, reduce healthcare utilization, and enhance clinician well-being. They operationalize lifestyle medicine principles in real-world settings, offering scalable, evidence-based strategies for primary care worldwide.

ID 944- How to evaluate patient empowerment in primary care? Validation of the Health Empowerment Scale for social prescribing

Karolina GRIFFITHS, Margot GIRARDOT, Antonio LOPEZ

Département Universitaire De Médecine Générale. Faculté De Médecine De Montpellier-Nîmes; Maison De Santé Pluridisciplinaire Montpellier Cevennes, Montpellier, France

Context: Across Europe, general practitioners (GPs) frequently care for patients facing social vulnerability, fragmented access to care and low confidence in managing their health. Social prescribing and health mediation aim to strengthen patient empowerment—defined as an individual's capacity to understand, manage and act on their health. The Health Empowerment Scale (HES) measures this construct, but no validated XXXX version existed, and it had not previously been tested in primary care or in social prescribing programmes.

Objectives: To validate the XXXX version of the Health Empowerment Scale (F-HES) and assess its feasibility for use in primary care social prescribing and health mediation programmes.

Methods: We conducted a prospective study in a multidisciplinary primary care centre in an urban area with high social deprivation. Adult patients completed a questionnaire including sociodemographic items, the EPICES deprivation score, the XXXX HES (F-HES) and the General Self-Efficacy Scale (GSES). Psychometric analyses evaluated internal consistency (primary outcome: Cronbach's alpha), content validity, construct validity and sociodemographic invariance.

Results: A total of 150 patients participated. Completion time for the F-HES was short (approximately three minutes), and items were reported as easy to understand. Internal consistency was high (Cronbach's alpha = 0.83; 95% CI: 0.79–0.87). Content validity was excellent (S-CVI/Ave = 0.89). A moderate positive correlation with the GSES (r = 0.29, p = 0.01) supported construct validity. The scale also demonstrated good sociodemographic invariance, measuring empowerment similarly regardless of native language, deprivation level, chronic disease status or involvement in health mediation. No floor or ceiling effects were observed. Health mediators reported that the tool was simple to administer and useful for identifying unmet needs.

Discussion: The F-HES showed strong psychometric properties and was feasible to implement in a busy primary care setting serving socially vulnerable patients. Its brevity, clarity and stability across subgroups make it suitable for a wide range of primary care contexts.

Conclusion: The F-HES is a valid, reliable and practical instrument for assessing patient empowerment in primary care, and can be used for both clinical evaluation and research within social prescribing and health mediation programmes.

ID 879- Social prescribing in diabetic foot prevention helps introduce evidence-based medicine knowledge into everyday life

Katarina DOSTALOVA [(1)] , Viera DONICOVA [(2)], Iveta KOPALOVA [(3)], Nadezda JANKELOVA [(1)], Kristina DOSTALOVA [(4)], Maria BARTUSOVA [(1)], Sona OSTROVSKA [(5)], Dana CAHOJOVA [(6)], Martin SMATANA [(1)]

(1) Slovak Medical University, Bratislava, Slovaquie
(2) Slovak Diabetes Society, Bratislava, Slovaquie
(3) Slovak Society Of Angiology, Bratislava, Slovaquie
(4) University Le Havre, Le Havre, France
(5) Slovak Society Of General Practice, Bratislava, Slovaquie
(6) Municipality Office Karlova Ves, Bratislava, Slovaquie

Context: Diabetic foot syndrome (DFS) is defined as foot disease in a patient with current or previously diagnosed diabetes mellitus (DM). DM screening and patient dispensary is well established in Slovakia, but the management of DFS prevention remains a major challenge for all specialists involved.ce-based medicine and diabetics.

Methods: The Institute of Health Analyses, Ministry of Health, in cooperation with the Slovak

Medical University analyse DFS in patients with DM in Slovakia.

Originality: In 2015, 358,835 patients with DM were dispensarized in Slovakia (22,675 newly diagnosed), which increased to 464,535 in 2023 (13,931 newly diagnosed). The total number of cases of DFS has a decreasing trend, 5,983 cases in 2023, compared to 6,450 in 2018

Lessons learned and future implication: We bring practice-based reflection of SP in prevention of DFS from the communities of Bratislava III and IV districts: 1. Diet adherence: The Bratislava IV District Municipal Office provides meals for seniors in several ways depending on their health stat

Discussion: Social prescribing (SP) is a person-centered approach used by healthcare workers. SP connects people to non-clinical community activities and services to improve their health.

Conclusion: The level of knowledge and innovation in DM management is constantly improving, but unfortunately, it may not be accessible to patients with adverse social characteristics. SP has the potential to be an effective mediator between evidence-based medicine and diabetics.

ID 2147- Did the HIV/AIDS pandemic present an opportunity to decolonise gender?

Andrey GLADKOV

Rcgp, London, Royaume-Uni

Context: Coloniality has had a profound impact on native populations around the world. The paper explores how the colonial legacy preconditions a disproportionate burden of HIV/AIDS on disempowered groups such as women and gender diverse groups (lesbians, gay men, men who have sex with men, trans people and other identities).

Objectives: This paper aims to fill a gap in research into how coloniality of gender manifests within the context of the HIV/AIDS pandemic and shapes gendered inequalities in prevalence and incidence rates as well as prevention and treatment strategies.

Methods: A scoping literature review was conducted applying a two-stage methodology: a search on Google Scholar using the keywords “HIV”, “gender” and “coloniality” for review articles published to date; and the PubMed database was searched. A critical thematic content analysis was the main method to identify key themes, comparing and contrasting them and contextualising them into a larger body of scholarship.

Results: The first stage of the search identified no systematic review papers into this area, which provides a strong justification for this research. At the second stage 14 papers satisfied the inclusion criteria (n=14). Most of the selected sources were empirical qualitative studies covering seven countries and two large regions Africa, while one paper provided a theoretical framework to conceptualise gender. The sources covered a 34-year date range, from 1989 till 2023.

Discussion: The analysis of the findings revealed the following broad interconnected themes: a) political economy of coloniality of gender; b) coloniality and women; c) coloniality and gender diversity; d) HIV/AIDS activism as a form of challenging coloniality of gender; e) sociocultural intersections between coloniality and gender; and f) neocoloniality of gender.

Conclusion: This paper makes an important contribution to the field of global health research by filling the gap as being the first literature review into the intersectionality of coloniality and gender in the context of HIV/AIDS pandemic. The findings identify several broad themes along which forces of coloniality intersect with gender to produce entrenched inequalities. While there have been successes in challenging coloniality, it has shown resilience and flexibility and taken new forms and channels of oppression of marginalised groups by embracing globalisation.

ID 1934- Investigation of the Relationship Between Smartphone Use and Intuitive Eating Behaviour in Medical Students

Ahmet EMIN, Didem KAFADAR

Istanbul University Cerrahpasa, Istanbul, Türkiye

Context: The widespread use of smartphones has become an integral part of daily life among medical students, raising concerns about problematic use and its potential impact on health-related behaviours, including eating patterns. Intuitive eating, which emphasizes awareness of internal hunger and satiety cues rather than external influences, has gained attention as a positive approach to eating behaviour and overall well-being.

Objectives: The aim of this cross-sectional study is to assess smartphone addiction risk and intuitive eating behaviours among medical students and to investigate their association with sociodemographic characteristics.

Methods: A total of 524 first-, second-, and third-year medical students were included in the study. Sociodemographic Data Form, Smartphone Addiction Scale - Short Form and Intuitive Eating Scale - 2 were applied to the participants face-to-face.

Results: Among all participants, 51,7% were found to be at risk of smartphone addiction. There was a negative correlation between Smartphone Addiction Scale score and Intuitive Eating Scale score. Participants with a chronic disease had a significantly higher risk of having smartphone addiction.

Discussion: In the present study, smartphone addiction was negatively correlated with intuitive eating behaviours, indicating that higher levels of problematic smartphone use are associated with lower intuitive eating scores among medical students. This finding is consistent with previous research demonstrating similar patterns in related contexts, suggesting that behavioural addictions can interfere with adaptive eating attitudes and behaviours.

Conclusion: In conclusion, this study highlights a significant negative association between smartphone addiction and intuitive eating behaviours among medical students, emphasizing the potential impact of problematic smartphone use on healthy eating practices.

ID 1367- Testicular thermal contraception within couples: a qualitative study on the experiences and motivations of partners

Marie BARAIS, Anne Lise ANDRE, Romain VERDEAU

Spurbo Ubo, Brest, France

Context: Contraception is defined by the WHO as 'any method used to reduce the risk of unwanted pregnancy'. The testicular thermal contraception (TTC) method involves moving the testicles up into the groin area to warm them and pause spermatogenesis.

Objectives: In the context of cisgender heterosexual couples, the experiences, motivations and barriers of the partners of TTC users will be explored.

Methods: A qualitative study was conducted in the form of individual interviews. The target population was adult women who wished to participate in this research project and who were or had been in a relationship with someone who used or had used CTT. The interviews were conducted using a semi-structured interview guide, exploring the initiation of CTT and then the experience of daily use. An analysis from a phenomenological-pragmatic perspective was carried out.

Results: Twelve semi-structured interviews were conducted to achieve data saturation. The use of TTC was often motivated by dissatisfaction with available female contraceptives. This led to reflections on the couple's relationship and on the importance and trust placed in contraception. This approach was rooted in a broader commitment that went beyond simple birth control.

Discussion: The male contraception approach was part of a commitment that went beyond the individual. It could be seen as an act of collective reflection on established social norms. The relationship with healthcare professionals was very nuanced, ranging from fear of judgement to anger and regret at the lack of support and, in some cases, collaboration. It would be interesting to examine how general practitioners perceive and obtain information.

Conclusion: This qualitative study explored the perceptions of partners of users of thermal contraception. It highlighted relational and identity issues that had not been widely identified until now. There also appeared to be a desire for couples to jointly develop their contraceptive approach. A comparative study of the experiences of women and men would be interesting in order to understand the different dynamics. This analysis invites healthcare professionals to look into testicular thermal contraception and consider working collaboratively with user associations to offer support and clear information about this still underdeveloped method.

ID 1268- Biodiversity and health: exploring patient and GP perspectives

Manon SCHWEICHER [(1)], Charlotte BRÉDA [(1)] , Flavien COLLART [(2)], Antoine GUISAN [(3)], Nicolas SENN [(4)], Aline SIGRIST [(4)], Justine SINIGAGLIA [(5)], Damien WAGNER [(4)]

(1) Camg/irss/uclouvain, Bruxelles, Belgique
(2) Département De Biologie-Université De Liège, Liège, Belgique
(3) Ecospat Lab Dee/unil, Lausanne, Suisse
(4) Dmf/unisanté, Lausanne, Suisse
(5) Irss/uclouvain, Bruxelles, Belgique

Context: A growing body of scientific studies demonstrates the beneficial impact of nature on health. However, the importance of nature, and particularly biodiversity, for food security, health, and climate preservation appears to be underrepresented in public discourse and is not sufficiently emphasized by healthcare professionals. Research has been conducted in xxx and xxx on patients' and general practitioners' perceptions and understanding of the surrounding biodiversity, its preservation, and the links to their own or patients' health.

Objectives: - Assess individuals' understanding of biodiversity in their surroundings compared to objective measures (high-resolution maps). - Explore perceptions of the link between contact with biodiversity and health and well-being. - Examine the diversity of social practices regarding nature, influenced by personal circumstances. - Investigate the connection between social representations, living context, and current practices. - Develop arguments and communication strategies to raise awareness among the public, GPs, and policymakers about the links between biodiversity, health, and the need to preserve ecosystems

Methods: Qualitative methods -40-50 semi-structured interviews with patients in xxx and xxx - 40-50 semi-structured interviews with GP in xxx and xxx -High-resolution biodiversity maps were used to compare individuals' perceptions with biodiversity data. -Focus groups with patients and GPs to identify strategies for improving communication about biodiversity's health benefits. All data are fully transcribed and analyzed using a comprehensive and thematic approach.

Results: Only partial results are available at this stage of the research (November 25). The available results show that: -Concepts of biodiversity, nature, and environment are not clearly distinguished by patients -Patients showed little awareness of biodiversity's direct effects on physical health. However, they valued the role of nature contact in enhancing their mental health and overall well-being

Discussion: First results show that patients are often willing to talk about their relationship with nature. They, however, have more difficulties with the concept and definition of biodiversity as described by biologists. Patients, also aware of the necessity to be more in contact with nature/biodiversity, the expected benefits remain vague

Conclusion: It seems important to better characterize the biodiversity-health nexus in the context of clinical care, in order to define tools and strategies for daily primary care practices.

ID 1062- The Ethics of Medical Tourism- viewpoint from a NHS Doctor

Sapna AGRAWAL [(1)] , John SPICER [(2)], David MISSELBROOK [(3)]

(1) Gp Birminghamrcgp-Medical Ethics, Birmingham, Royaume-Uni
(2) Gp Croydon, Rcgp-Chair Medical Ethics,, London, Royaume-Uni
(3) Retired London Gp Emeritus Dean, Royal Society Of Medicine Past Associate Professor Of Family Medicine, Rcsi Bahrain, London, Royaume-Uni

Context: Globally, people have more options, contributing to the rise of medical tourism. Three types of medical tourism are discussed: Inbound, outbound and the emerging diasporic medical tourism.

Methods: Turkey welcomed about 1.5 million international health visitors in 2024 (USHAS), generating $3 billion. The global medical tourism market in 2024 was estimated to be $31 billion and it is predicted that by 2030 this will have increased to $87 billion. Popular causes for medical tourism include dental procedures, cosmetic procedures, bariatric surgery, orthopaedic surgery, IVF and ophthalmology. Other popular destinations include the UAE, India, South Korea, Thailand, Spain and Brazil.

Originality: Work done exploring why patients travel abroad include cost saving, long waiting lists, and access to a particular procedure. Factors looking on how people decide destinations include the internet, testimonials, facilitators or medical tourists reports.

Lessons learned and future implication: Research has shown patients will travel for faster access, many combining holidays with a medical procedure. However, quality and accreditation are critical. Differences in local culture or language may lead to suboptimal care and follow-up.. On return, c

Discussion: This presentation aims to discuss the future implications of medical tourism on primary care across the World/Europe, and how technology will expand cross-border care, lead to increasing global competition for patients and possibly the development of specialist hubs in different countries. Medical tourism also highlights health inequalities between those able to afford treatments abroad.

Conclusion: Medical tourism is a rapidly growing field. In the future, insurance providers may start covering treatments abroad. Stronger international standards and regulations will be needed. At this time, medical tourism highlights the need for domestic reform in medical treatment with investment in waiting time reduction, specialist care and price transparency. Countries with high numbers of inbound medical tourists must balance economic benefits with protecting access for their own citizens.

ID 282- Body awareness and prevention of child sexual violence: an experience report

Matheus MATOS, Fabio QUAGLIATO, Soraya VARELLA, Clarice ITO, Maria Eduarda SOUZA, Marcelo DUTRA, Lucila ANGELOTTI

Centro Universitário Barão De Mauá, Ribeirão Preto, Brésil

Context: Child sexual violence represents a severe public health problem and a profound violation of human rights, with lasting physical, emotional, and social consequences. In XXX, vulnerable children often face neglect, domestic violence, and abuse. Schools, as spaces of daily coexistence, are essential for protection and early identification of such situations. This project emerged from a university extension initiative aiming to strengthen child protection through health education.

Methods: The intervention took place at a state school and involved 30 elementary school children, teachers, and six medical students from XXX. Using active learning and playful strategies, activities such as the “Touch Traffic Light” dynamic and the educational song “in this and in that” addressed body boundaries, self-respect, and communication of discomfort. Preparation included meetings with

teachers to adapt language and methods, ensuring cultural sensitivity and emotional safety. The experience was evaluated qualitatively through observations and participant feedback. Strengths included strong engagement and reinforcement of the school's protective role; limitations were time constraints and the need for ongoing teacher training.

Originality: While many prevention programs address sexual abuse through theoretical discussions, this project innovated by integrating ludic, culturally adapted tools within a public-school context and by promoting medical students' direct participation. Literature o

Lessons learned and future implication: The initiative proved that simple, low-cost, and interactive approaches can effectively promote body awareness and empower children to recognize and report unsafe situations. Teachers expressed greater confidence to discuss sensitive topics, highlighting

Discussion: The project strengthened collaboration between the university and the community, linking theory and practice in medical education. It emphasized the school's role as a protective environment and the value of health education as a preventive tool against violence.

Conclusion: Educational, playful strategies are effective for promoting self-care and preventing child sexual violence. The project reinforced the relevance of university extension activities in health promotion, humanistic training, and social transformation.

ID 251- The role of primary care providers in supporting more sustainable lifestyles: Experiences and expectations of vegan parents

Marta VELGAN

University Of Tartu, Tartu, Estonie

Context: There is growing evidence of the harms caused by the mass production and consumption of animal products and the benefits of plant-based diets – ethically, environmentally, and for human health. While human and planetary health are increasingly viewed as interconnected, the healthcare system remains largely anthropocentric and disengaged from sustainability goals. Given its influential role, the healthcare system can either support or hinder the acceptance of plant-based diets as part of addressing ecological and public health crises.

Objectives: The aim of this study was to explore the experiences and expectations of vegan parents in their interactions with primary care providers (PCP).

Methods: Qualitative research based on semi-structured individual interviews was chosen to explore this topic. A snowball method was used to recruit the participants. The interviews were transcribed and analysed using thematic analysis. Software Nvivo (Lumivero, 2023) was used to analyse the data.

Results: Semi-structure interviews with 25 vegan parents in Estonia were conducted. Most participants were ethnic Estonians living in Estonia. The average length of the interviews was 76 minutes. Three larger themes were identified: 1) Notifying the PCP about the family's/children's veganism; 2) Experiences with PCP reactions after disclosing veganism and 3) Expectations of vegan parents in relation to PCPs.

Discussion: Our findings indicate that while some parents reported neutral or supportive experiences, negative and unsupportive interactions with PCPs were more typical. Fear of stigma led some to avoid disclosing their family's veganism altogether. These findings highlight important concerns about the quality and equity of healthcare, patient autonomy, and the healthcare system's potential role in supporting and promoting plant-based diets and sustainable food practices more broadly.

Conclusion: As powerful institutional authorities, the healthcare system and its key actors, such as PCPs, can and should support moving towards more sustainable and ethical food and health futures.

Specialty Training

ID 1911- Representations of First-Year General Practice Residents Regarding Their Professional Pathways

Juliette LE DANTEC, Michel PRADE, Laurine MOLLIER, Alain JAMI

Université Versailles-Saint-Quentin-En-Yvelines (uvsq), Université Paris-Saclay, Montigny-Le-Bretonneux, France

Context: The evolution of medical demographics and practice patterns prompts reflection on the professional aspirations of general practice residents, who are training within a changing healthcare system.

Objectives: This study aimed to explore the representations of first-year general practice residents' envisioned professional pathways.

Methods: Individual interviews were offered during their first general practice rotation to all residents who began their general practice training program in November 2023 in the university of XXX. We conducted a phenomenologic analysis of the interview transcripts, allowing a theory to emerge, as well as a descriptive statistical frequency analysis of some of their characteristics.

Results: 68 interviews were conducted between February and October 2024. The professional pathways of first-year general practice residents can be conceptualized as two interrelated dimensions: the development of a professional identity and the construction of a professional projection. Identity development begins with the choice of general practice, followed by adaptation to a new status as residents, while gradually becoming aware of the existential dimension involved in shaping their medical identity. In parallel with this identity-building process, their professional project emerges. Initially as an idealized vision, then through encounters with real world conditions, enabling progress in envisioning one's future professional practice.

Discussion: The construction of professional identity, an evolving process throughout medical training, is essential for achieving job satisfaction. This study is the first to question professional projects of an entire university cohort of general practice residents. It is limited to the views of early-stage students, though it aims to continue throughout their academic pathway. Ongoing research is tracking how students' professional projects evolve throughout their studies. Furthermore, a qualitative study is currently being carried out through interviews with the 2024 cohort.

Conclusion: Understanding the professional pathways of residents is crucial to support them throughout their training and their transition into local practice.

ID 1292- Navigating a New System: Helping New Resident Doctors Adapt, Learn, and Lead

Abidemi OGUNSOLA, Anjla SHARMAN, Pooja SHETYE

Health Education England, Northampton, Royaume-Uni

Context: An increasing number of General Practice (GP) Doctors are entering training with limited prior experience of working within the country in which they choose to train. Many are international medical graduates and doctors from non-primary care settings. They bring valuable skills and perspectives but often require additional support to adapt to local healthcare structures, professional expectations, and the culture of general practice.

Methods: Recognising this transition challenge, we developed and piloted a Structured Learning Programme to support GP trainees with fewer than six months experience working in the country at the start of their training. The pilot provided a 4-month placement where trainees had some of their clinical time replaced with additional education time on key GP domains and contextual topics.

Originality: In preliminary findings, trainees reported significantly increased confidence in navigating the local systems, understanding the GP

role in the wider healthcare structure, and engaging safely with primary care processes. Qualitative feedback highlighted t

Lessons learned and future implication: This pilot demonstrates that a structured, early orientation programme and contextual learning can ease the transition for trainees new to the country and improve their confidence and engagement.

Discussion: Evidence from national training data highlights differential attainment among these Doctors, reflecting multifaceted influences such as unfamiliarity with the national systems, differing cultural and communication norms, and variations in prior learning experiences. Recognising and addressing these challenges is key to ensuring equitable training outcomes. Structured orientation programmes and inclusive educational practices can help bridge early gaps in confidence and understanding, support diversity within the GP workforce, and promote equitable progression and culturally competent patient care.

Conclusion: Structured learning intervention can support new trainees with limited local experience, improving early adaptation and well-being. Further evaluation with larger cohorts will help refine content and assess long-term impact on performance and patient care.

ID 752- Awareness and Prescribing Attitudes Toward Topical Corticosteroids Among Medical Residents

Bahar GULER FILIZ [1] , Ozlem POLAT [1], Bilgen ERDOGAN [2], Neslihan ALTINÖZ [1], Betül ONDES DENIZLI [1], Melih FILIZ [3]

(1) Department Of Family Medicine, Bakırköy Dr. Sadi Konuk Training And Research Hospital, Istanbul, Türkiye
(2) Department Of Dermatology, Bakırköy Dr. Sadi Konuk Training And Research Hospital, Istanbul, Türkiye
(3) Department Of Internal Medicine, Arnavutköy State Hospital, Istanbul, Türkiye

Context: Topical corticosteroids (TCS) are essential treatments for inflammatory skin diseases, yet inappropriate prescribing and insufficient counselling may lead to preventable adverse effects. In both primary care and hospital settings, limited knowledge of potency selection, duration of therapy, formulation choice, and potential side effects may result in suboptimal outcomes and contribute to steroid-related anxiety described as TOPICOP. Understanding the awareness and prescribing attitudes of residents from different specialties is necessary to identify training needs and guide educational strategies.

Objectives: To evaluate residents' knowledge, awareness, and prescribing attitudes related to TCS use and to identify corticosteroid-related concerns influencing clinical decisions.

Methods: This cross-sectional study was conducted between July and October 2024 in a tertiary hospital. A total of 210 residents from Family Medicine, Internal Medicine, Obstetrics & Gynecology, Pediatrics, and Emergency Medicine participated. A structured 32-item questionnaire assessed knowledge of TCS indications, potency ranking, formulation selection, application amount, treatment duration, and awareness of adverse effects. Internal consistency of the knowledge section was high (Cronbach's alpha = 0.82). Total scores ranged from 0–32. Statistical analyses included chi-square tests, ANOVA, and t-tests, with significance set at $p<0.05$.

Results: Among the participants, 53.8% were female. The mean knowledge score was 18.3 ± 5.6, and only two residents achieved full scores. While general awareness of TCS side effects was high (95.2%), knowledge of specific adverse effects such as glaucoma (24.8%) and rosacea (25.7%) remained low. Family Medicine and Pediatrics residents showed lower hesitation in prescribing TCS ($p<0.001$). Internal Medicine residents reported the highest dermatology referral rate due to fear of adverse effects (31.4%, $p<0.001$). Knowledge of potency hierarchy, formulation choice, and application amount was significantly higher among Family Medicine residents than among Internal Medicine and Obstetrics & Gynecology residents ($p<0.01$). Awareness of hirsutism, acne, and Cushing syndrome was lowest in Obstetrics & Gynecology ($p<0.001$). Knowledge scores did not vary by seniority ($p>0.05$).

Discussion: Inter-specialty differences in knowledge and prescribing behaviors suggest that steroid-related fear influences clinical decision-making and contributes to unnecessary referrals.

Conclusion: Targeted, structured educational programs are essential to improve residents' competence in TCS prescribing, reduce corticosteroid-related anxiety, and ultimately enhance patient safety and treatment quality.

ID 665- Toward Opportunities for Inclusive GP-Specialty Training – On Building Bridges over the Unspoken Undercurrents

Nathanja VAN MOPPES [(1)] , Maria MUIJSENBERGH [(2)], Jettie BONT [(1)], Mechteld VISSER [(1)], Judy VAN ES [(1)]

(1) Amsterdamumc, Amsterdam, Pays-Bas
(2) Radboud Umc, Nijmegen, Pays-Bas

Context: Ethnic minority trainees in Dutch GP-specialty training disproportionately face underperformance judgments, microaggressions, and exclusion. These attainment gaps are not solely explained by academic or socio-demographic factors, but rather by systemic dynamics in training environments. Addressing these inequities is essential to ensure diverse GP-workforces capable of delivering accessible, culturally responsive care.

Objectives: This thesis aimed to answer the following questions: To what extent do ethnic minority GP-trainees experience inequitable educational outcomes? How do they describe and navigate their learning experiences and professional identity formation? Which institutional practices foster more inclusive training environments and equitable opportunities?

Methods: This mixed-methods thesis combined quantitative and qualitative approaches. Retrospective analysis of trainee files (n=1,870, seven institutes) examined underperformance risk using multilevel logistic regression. Semi-structured interviews (n=14) explored educational experiences and coping strategies. Participatory action research engaged trainees, supervisors, management, and policymakers in twelve focus group sessions to co-design feasible, broadly supported recommendations, which informed a national implementation plan.

Results: Ethnic minority trainees had a significantly higher likelihood of being assessed as underperforming, independent of competence domain. Interviews revealed limited support networks, culturally biased curricula and assessments, microaggressions, exclusion, and challenges in professional identity formation. Coping involved problem-solving, emotional regulation, and relying on social support, yet could inadvertently constrain learning (e.g., reduced openness in reflective groups). Stakeholders identified seven DEI-strategies; three were prioritized for implementation: appointing DEI-ambassadors across organizational levels; amplifying minority trainee input in program development; and mandating DEI-training for staff and supervisors.

Discussion: Strengths of this research include its mixed-methods design, triangulation across multiple data sources, and extensive stakeholder involvement. Limitations involve retrospective quantitative data and a modest qualitative sample size. While the findings align with international literature on differential attainment, hidden curricula, and microaggressions, this thesis contributes novel insights into structural determinants of inequitable outcomes and clarifies institutional responsibilities within GP-specialty training. It presents one of the first nationally coordinated DEI-strategies in European medical education, supporting transferability to other specialties and international contexts. Future research should assess long-term impact, investigate intersectional experiences, and evaluate broader scalability.

Conclusion: This thesis reframes underperformance as an institutional issue, provides actionable strategies to advance inclusive medical education, and strengthens culturally responsive GP-workforces.

ID 456- Disentangling communication challenges in trainees' learning journeys: a longitudinal study in the General Practice specialty training programme

Michelle VERHEIJDEN [1] , Esther GIROLDI [1], Juliette Anna BEUKEN [2], Jean MURIS [3], Patrick DIELISSEN [4], Anique DE BRUIN [2], Lisa DE JONGE-'T HOEN [5], Angelique TIMMERMAN [1]

(1) Department Of Family Medicine, Care And Public Health Research Institute (caphri), School Of Health Professions Educations (she), Maastricht University, Maastricht, Pays-Bas
(2) Department Of Educational Development And Research, School Of Health Professions Education (she), Maastricht University, Maastricht, Pays-Bas
(3) Department Of Family Medicine, Care And Public Health Research Institute (caphri), Maastricht University, Maastricht, Pays-Bas
(4) Department Of Public Health Service And Sexual Health. Ggd Noord Oost Gelderland,, Nijmegen, Pays-Bas
(5) Department Of Family Medicine, Erasmus Mc, Rotterdam, Rotterdam, Pays-Bas

Context: Doctor-patient communication is a core competency for General Practice (GP) trainees and is addressed through generic communication-skills training. However, learning communication in the workplace requires a contextualised and flexible approach known as 'skilled communication'. Learning skilled communication involves adapting and monitoring communication to the needs of each encounter. Although previous cross-sectional research suggests that workplace communication challenges can trigger learning, the nature and development of these challenges remain unclear.

Objectives: This study aims to identify which communication challenges act as triggers for learning and to explore how these challenges evolve over time to support educators in providing targeted coaching. Our research question is: 'Which communication challenges do learners encounter during their longitudinal learning journey to develop skilled doctor-patient communication?'

Methods: We conducted a longitudinal qualitative study using a phenomenological approach and Crowther's principles to craft stories illustrating the communication challenges learners encounter in the workplace. Over six months, we collected clinical observations, interviews, and audio-diaries from eight first- and five third-year XXX GP trainees. Analysis followed a twofold process: thematic content analysis with data triangulation, after which findings were used to craft stories.

Results: Thirteen GP trainees generated a dataset of 26 interviews, 26 clinical observations, and 115 audio-recordings, averaging nine audio-recordings per trainee over six months. One story was crafted for each training year group. First-year trainees focused on the effectiveness of patient-centred communication skills. Third-year trainees took a more reflective perspective, using self-monitoring skills to develop a personalised style, adapt communication to patients' needs, and work collaboratively, driven by curiosity about the patient's broader context.

Discussion: Our findings underscore that workplace learning is often implicit and informal, causing challenges to go unrecognised. Consistent with earlier studies, a safe, collaborative environment supports learners in recognising and sharing difficulties and successes. This study further shows that the nature of communication challenges evolves over time and differs across training stages.

Conclusion: We identified workplace communication challenges that trigger the development of skilled communication. Learners benefit from a safe environment and scaffolded guidance from educators that helps them recognising communication challenges, turning implicit challenges into explicit learning, and fostering self-monitoring skills throughout their learning journey.

Corresponding author: Michelle Verheijden, m.verheijden@maastrichtuniversity.nl

ID 379- From Sputnik to Social Contract: Societal Forces Shaping Supervision in Family Medicine Residency

Padraig CASEY

Dalhousie University, Charlottetown, Canada

Context: Medical education evolves in response to societal imperatives. From Enlightenment ideals of liberty and collective responsibility to modern pressures of social accountability and workforce shortages, training paradigms have shifted under external influence. Today, with over 6.5 million Canadians lacking access to a family physician and many graduates opting for focused practice, questions about how supervision during residency prepares physicians for comprehensive care are increasingly urgent.

Objectives: To explore how supervision of senior family medicine residents is enacted during the final months of training and how these practices align

with educational theory and societal expectations for readiness for independent practice.

Methods: A qualitative design using interpretive description methodology was employed. Semi-structured interviews were conducted with recent graduates (n=5) and experienced preceptors (n=6) from the Dalhousie Family Medicine program. Data were analyzed thematically, informed by sociocultural learning theory and concepts of entrustment.

Results: Supervision practices varied widely, oscillating between close oversight and distant mentorship. Decisions about autonomy were shaped by trust, perceived risk, and institutional norms rather than rigid competency frameworks. While benchmarking tools emphasized independence by month 18, participants described persistent ambiguity around what "independence" meant in practice. Both residents and preceptors highlighted the importance of authentic clinical responsibility and expressed a strong desire for structured mentorship beyond residency.

Discussion: Findings reveal a tension between theoretical ideals—competency-based education, entrustable professional activities—and the lived reality of supervision. Entrustment emerged as a relational process, echoing Rousseau's notion of a social contract: balancing liberty (autonomy) with collective responsibility (patient safety). The Soviet Union's launch of Sputnik in 1957 led to the development of competency-based education, the dominant paradigm of recent decades. Similarly, current pressures for social accountability amidst inequities in access and physician shortages mean we must prioritise preparing graduates for comprehensive community practice. This study argues that readiness for practice requires more than technical competence; it demands adaptive expertise, confidence, and solidarity within a community of practice.

Conclusion: Curriculum design should integrate opportunities for supervised independence, mentorship beyond graduation, and future-facing assessment strategies that prioritize adaptability and confidence. These reforms are essential to ensure graduates are not only competent but truly prepared for the complexities of independent practice.

ID 89- Autonomy-supportive supervision and residents' motivation in clinical placements: A nationwide cross-sectional study

Isabelle ETTORI, Coraline BAUCHER

Université De Tours, Tours, France

Context: Residents' motivation is a key driver of learning, professional identity development, and well-being. According to Self-Determination Theory (SDT), autonomy-supportive supervision fosters self-determined motivation, yet little is known about how residents perceive supervisory motivational style across clinical settings, including general practice, in XXX.

Objectives: To examine the association between residents' perception of their clinical supervisor's motivational style and their self-determined motivation to engage in clinical placements, and to explore variations across specialties and training settings.

Methods: A nationwide cross-sectional online survey was conducted among XXX residents (postgraduate years ~1–3) between October and December 2024. Motivational style was assessed using the Learning Climate Questionnaire (LCQ), and motivation using the Global Motivation Scale with calculation of the Self-Determination Index (SDI). Pearson correlation explored associations between perceived motivational style and SDI. ANOVA examined variations according to gender, specialty, stage of training, and practice setting.

Results: A total of 918 residents participated. Mean LCQ score was 3.66 (SD 0.84), and mean SDI was 5.31 (SD 4.86), indicating moderate perceived autonomy support and self-determined motivation. Perceived autonomy support was moderately and positively correlated with SDI ($r = 0.376$, $p < 0.001$). Higher autonomy support and SDI were observed in specialties emphasizing continuity and patient-centred care, including general practice, paediatrics, and oncology, and in ambulatory settings. Lower scores were observed in procedural and protocol-driven specialties. Female residents reported higher

SDI than male residents. No difference in motivational style was found by residency phase.

Discussion: Residents who perceived supervisors as autonomy-supportive reported more self-determined motivation. Ambulatory settings appeared particularly favourable for motivation, possibly due to closer supervision and formal supervisor training in teaching skills. Findings suggest that fostering autonomy-supportive supervision may enhance learning, engagement, and interest in teaching careers in primary care. Cross-sectional design prevents causal inference. Self-selection bias and unequal representation across specialties may limit generalisability. Motivation and supervisory style were self-reported, and supervisor perspectives were not assessed.

Conclusion: Autonomy-supportive clinical supervision is associated with stronger self-determined motivation among residents. Integrating autonomy-supportive strategies into faculty development programmes, particularly in hospital settings, may promote learner well-being and support high-quality clinical training in general practice.

Corresponding author: Coraline Baucher, coraline.baucher@etu.univ-tours.fr

Specialty training development

ID 1864- Competency assessment tools for healthcare students: a scoping review

Zaïna-Amal NOKRI, Racha ONAISI

Department Of General Practice, University Of Bordeaux, Bordeaux, France

Context: The assessment of competencies in health professions education is essential to support both students' learning and defensible certification decisions. In France, certification in general practice mainly relies on portfolios and the validation of clinical rotations, with inconsistent use of standardized scales. The current reform of GP residency is an opportunity for an assessment program remodeling, informed by an up-to-date overview of available assessment tools.

Objectives: Identify and catalogue assessment instruments used to evaluate health students' competencies reported in the peer-reviewed literature published between 2013 and 2023.

Methods: A scoping review was conducted following JBI and PRISMA-ScR guidelines. PubMed, Scopus, ScienceDirect, Cairn, Lissa were searched. Two reviewers independently screened records on Rayyan to apply eligibility criteria (article describing health students' competency assessment tool, published between 2013 and 2023) and select studies for inclusion. Data was charted in a criteria-based grid ; and analyzed following Arksey & O'Malley's framework.

Results: Of 1,005 records retrieved, 368 studies were included, describing 240 distinct tools. Most originated from Anglo-Saxon countries and focused on medicine and surgery. OSCEs, observation-based checklists, and portfolios were the most reported tools. Tools were mainly used for formative (±50%) or mixed (±25%) purposes. Only a minority were used exclusively for summative decisions.

Discussion: We provide an original and comprehensive mapping of competencies assessment tools, grounded in a rigorous methodology. It combines a systematic approach with descriptive analysis to support pedagogical decision-making. Publication bias, maybe enhanced by not exploring grey literature, could explain the overrepresentation of Anglo-Saxon context and underrepresentation of non-medical curricula. This highlights the need for context analysis before implementing tools in a non anglo-saxon setting, as transferability of tools could be questioned. Digital tools were rarely reported, and the absence of study quality appraisal limits inferences about validity.

Conclusion: This scoping review mapped 240 competency assessment tools between 2013 and 2023. It can inform the design of programmatic assessment programs. Further research should focus on providing stronger validity evidence and better coverage of non-medical and digital tools.

ID 1289- BRIDGE-PC: Mapping Digital Health Training in Primary Care Medical Curriculum Worldwide - A Survey Study

Edmond LI [(1)], Joana TEIXEIRA [(1)] , Vinicius ANJOS DE ALMEIDA [(2)], Raquel GOMEZ BRAVO [(3)], Bridge-Pc Collaborative Group N/A [(4)], Ana Luisa NEVES [(1)]

(1) Global Digital Health Unit, Department Of Primary Care And Public Health, Imperial College London, London, Royaume-Uni
(2) Universidade De São Paulo, Sao Paulo, Brésil
(3) Rehaklinik, Centre Hospitalier Neuro-Psychiatrique (chnp), Ettelbruck, Luxembourg
(4) N/a, N/a, Royaume-Uni

Context: The introduction of digital health tools into clinical environments has necessitated a corresponding increase in relevant training to ensure their proper use by clinicians. Current evidence highlights great variation in how it is taught across undergraduate, academic postgraduate, and residency-level medical programmes worldwide. Better understanding how digital health is being taught, both in course content, means of evaluation, as well as in its mode of delivery, will be necessary to guide efforts to update medical training curricula.

Objectives: 1. To better understand how digital health training is being incorporated in medical curricula (undergraduate/academic postgraduate/residency) across countries with differing health systems. 2. To identify any notable digital health training gaps and key topics which should be prioritised in future curricula improvements. 3. To examine and compare what teaching methods, modes of delivery, and evaluation tools/metrics are currently employed.

Methods: A multi-round, cross-sectional survey to capture current medical curricula pertaining to digital health training is being conducted through participating PCP national leads in the European General Practice Research Network.

Results: The Round 1 survey received responses from 45 out of 53 countries participating. Of those who answered, 49% (n=23) indicated the availability of digital health modules in undergraduate-level programmes. Likewise, 13% (n=6) reported formalised digital health training present in residency-level programmes. Data collection is currently ongoing for the Round 2 survey.

Discussion: The initial findings show strong international engagement and indicate substantial variability in digital health training across programmes and countries. Notable variation in topics covered, delivery means, and assessments highlights a lack of standardisation and consistency in training quality. Ongoing data collection for additional curricula will help clarify key gaps and priority areas to guide future curriculum development.

Conclusion: Digital health learning by PCPs has traditionally been heterogeneous and informal, especially when compared with other clinical skills. Better understanding the current state of digital health training in medical curricula globally is critical to providing national policymakers a point of reference for informing their own future training improvement efforts.

ID 939- A Health Systems Science–Anchored Curriculum for Community-Based Education in Medicine and Nursing Curriculum(Integrating Family Medicine and Public Health): Karabakh University Model

Mehmet AKMAN [(1)] , Gunay MURADOVA [(1)], Gunel ISAKOVA [(1)], Turana TURKOGLU [(1)], Sureyya MAMMADOVA [(1)], Turkan NABIYEVA [(1)], Gulsah JAFAROV UNSAL [(1)], Ikram RUSTAMOV [(1)], Samir N. BABAYEV [(1)], Halil Ibrahim DURAK [(2)]

(1) Karabakh University Faculty Of Medicine And Health Sciences, Karabakh University Clinic, Khankendi, Azerbaïdjan
(2) World Health Organization Azerbaijan Country Office, Baku, Azerbaïdjan

Context: XXX University Faculty of Medicine and Health Sciences in Khankendi was established with a mandate to integrate Family Medicine(FM) and Public Health(PH) within community-oriented primary care(COPC) models, aligning with global calls to strengthen collaboration between these fields including the joint advocacy of WONCA and the WFPHA.

Methods: A multidisciplinary faculty team designed an integrated FM-PH-Interprofessional Education(IPE) curriculum, guided by Kern's curriculum development model, competency-based medical education princiles, and the ADDIE instructional design.Competencies were mapped to CanMEDS roles and WFME standards. A longitudinal Community-Based Education(CBE) pillar was established: Year 1-Contextual understanding: students explore social determinants and health system structures through community mapping and reflective journaling. Year 2-Integration of practice and knowledge: students carry out micro-level community diagnosis and implement targeted intervention projects. Year 3-Leadership for system change: students engage in policy dialogue, advocacy activities, and the design of health promotion activities. Key limitations include the challenge of being a newly established institution in a post conflict area with limited baseline indicators and the need to build sustainable long-term partnerships.Nonetheless, early indicators suggest increased learner motivation and a deeper understanding of community health needs.

Originality: Although COPC based integration of FM–PH has been described elsewhere, there are few models developed from the outset for both medical and nursing students, with CBE+PE alongside health system science embedded from Year1. The XXX University model is furth

Lessons learned and future implication: Key lessons include the value of early and repeated community immersion, the importance of deliberately structured interprofessional teamwork, and the need for flexible governance mechanisms that can adapt to evolving context.Future priorities include dev

Discussion: This experience illustrates how FM and PH competencies can be developed in tandem through experiential, reflective, community-centred education.

Conclusion: The XXX University model demonstrates a scalable, context-responsive approach to integrating FM and PH through community based and interprofessional education.It offers practical insights for PC educators, particularly in settings undergoing health system rebuilding or transformation.

ID 1258- Competency framework for the socially responsible physician: towards a practice grounded in reality.

Naji MOKADDEM [1] , Bernard MILETTE [2], Marie HATEM [2], Majda SEBBANI [3], Valérie HANOZET [4], Ségolène DE ROUFFIGNAC [5]

(1) Unversité Catholique De Louvain, Brussels, Belgique
(2) Université De Montréal, Montréal, Canada
(3) Université Cadi-Ayyad, Marrakech, Maroc
(4) Université Libre De Bruxelles, Brussels, Belgique
(5) Université Catholique De Louvain, Brussels, Belgique

Context: Social Accountability in Health (SAH) is a concept defined by the WHO in 1995 for medical schools as "the obligation to direct their [activities] towards the priority health concerns of the [society] they have a mandate to serve", through four core values: quality, equity, cost-effectiveness, and relevance. This raises the question of extending the concept to the medical profession itself: what defines a socially responsible physician?

Objectives: To develop a competency framework for the socially responsible physician.

Methods: This study is an international collaborative research project. A preliminary data-collection phase aimed to gather a wide range of perspectives on physicians' SAH-related competencies. The framework was then constructed in three stages: 1) a hybrid classification, first a) deductive and then b) semi-inductive, followed by 2) a thematic synthesis, and enriched by 3) observations in real-world practice.

Results: The collected data included existing competency frameworks, an international consensus, a literature review, patients' perspectives, congress workshops, and internal work from XXX. Six competencies emerged from the analyses: 1) Clinical expertise in patient and community health; 2) Professional and relational ethics; 3) Scholarship for excellence and knowledge sharing; 4) Collaborative and committed leadership for the health of All; 5) Ethical, efficient, and sustainable practice management; 6) Continuous professional and personal reflexivity.

Discussion: The results reflect the convergence of diverse sources and reveal six competencies of the physicians' social accountability. However, the absence of data from the Southern Hemisphere and from other healthcare system actors (policy-makers and health managers) should be noted. This framework constitutes a structuring tool to rethink medical education, support continuing professional development, and strengthen physicians' engagement with the health needs of the populations they serve.

Conclusion: This competency framework represents a further step towards a medical practice grounded in reality and responsive to the health needs of society. Another study examines how these competencies manifest in general practice.

Corresponding author: Naji Mokaddem, dr.nmokaddem@gmail.com

ID 1107- Mapping postgraduate digital health training for primary care physicians: A scoping review

Sandra LEÓN-HERRERA [(1)] , Raquel GÓMEZ-BRAVO [(2)], Sıdıka Ece YOKUŞ [(3)], Vinicius ANJOS DE ALMEIDA [(4)], Joana TEIXEIRA [(5)], Sandro Rogerio RODRIGUES BATISTA [(5)], Edmond LI [(5)], Ana Luisa NEVES [(5)]

(1) Department Of Psychology And Sociology, University Of Zaragoza, Zaragoza, Espagne
(2) Centre Hospitalier Neuropsychiatrique, Ettelbruck, Luxembourg
(3) Eyüpsultan District Health Directorate, Istanbul, Türkiye
(4) University Of Säo Paulo, Säo Paulo, Brésil
(5) Imperial College Londo, London, Royaume-Uni

Context: The rapid digital transformation of healthcare has heightened the need for primary care physicians (PCPs) to develop competencies in digital health. Although several postgraduate training initiatives have emerged, educational approaches remain highly heterogeneous, and no scoping review has systematically mapped postgraduate digital health training programs specifically targeting PCPs.

Objectives: To identify and map postgraduate digital health training programs for PCPs; to describe their educational content, structure, delivery approaches, and assessment strategies; and to identify gaps and opportunities for future curriculum development.

Methods: This scoping review follows the Joanna Briggs Institute methodology and the PRISMA-ScR checklist. A systematic search was conducted across PubMed, Scopus, Cochrane Library, ScienceDirect, and Web of Science for sources published between January 2019 and June 2025. Grey literature screening is ongoing. Eligible studies include postgraduate educational initiatives, curricula, and training programs addressing digital health competencies for PCPs. Two reviewers independently screened records. A total of 384 titles/abstracts were screened, followed by full-text assessment of 91 articles. Fourteen studies met the inclusion criteria, and the data charting is underway. Next, we will conduct a descriptive synthesis and inductive thematic analysis.

Results: The 14 included studies represent diverse approaches to postgraduate digital health training for PCPs. Preliminary analyses indicate substantial variability in scope, ranging from structured competency-based curricula to focused interventions on specific digital skills. Identified initiatives include telemedicine curricula, artificial intelligence training frameworks, online and video-based educational interventions, Massive Open Online Courses (MOOCs) on planetary health, and evaluations of digital education models. Programs differed in delivery mode (online, blended, synchronous/asynchronous) and target audience (residents, early-career PCPs, mixed groups). Reporting on evaluation methods and long-term learning outcomes was limited.

Discussion: Preliminary findings reveal a fragmented and heterogeneous landscape of postgraduate digital health training for PCPs, with gaps in standardization, competency frameworks, and evaluation strategies.

Conclusion: This ongoing scoping review highlights the need for more coherent, competency-based, and evaluable approaches to postgraduate digital health training for PCPs. The final results will provide a comprehensive synthesis to inform curriculum development, policy-making, and future digital health education strategies in primary care.

ID 1156- Competencies in AI-literacy for postgraduate medical education – a needs assessment with trainees in family medicine

Andreas Christian DREHER [(1)], Christine BECKER [(1)], Tanja JÄHNIG [(2)], Martina BISCHOFF [(3)], Christian FÖRSTER [(4)], Attila ALTINER [(1)], Simon SCHWILL [(1)]

(1) Department Of Primary Care And Health Services Research, Heidelberg, Allemagne
(2) Insitute For General Practice, Ulm, Allemagne
(3) Insitute For General Practice, Freiburg, Allemagne
(4) Institute For General Practice And Interprofessional Care, Tübingen, Allemagne

Context: Within few years, Artificial Intelligence (AI) has been integrated into various daily processes. Use of AI might ease Family Physicians (FP) need for time or diagnostic uncertainty. However, physician's openness for digital tools appears multivarious and training the use of AI in Family Medicine (FM) has not yet spread among postgraduate medical education programs, at least in Germany.

Objectives: Aim of this study was to explore use of AI in daily routine among FM trainees, their attitudes towards AI and their educational needs in order to adapt curricula in postgraduate medical education.

Methods: FM trainees of the competence center for postgraduate medical education XXX(federal state)XXX 2025 were invited to participate in an online-survey. The questionnaire consisted of 51 items about sociodemographic, experiences with AI-usage, attitudes towards AI and educational needs. It included open text-questions. Data was analyzed descriptively and open-texts semi quantitatively.

Results: In total, N = 135 FM trainees participated (response rate 20%), 74% female and 63% in 4th or 5th year of training. With a mean age of 36, 76% had currently been in FM rotation. 74% declared their actual practice to be fully or mostly digitalized, 22% stated use of AI in their training post whereas 79% reported private use of AI and 65% professional use of AI. 50% declared daily use of AI or at least various times per week. Chat-GPT was the LLM mostly used. In FM, two third used AI for differential diagnoses and/or for therapeutic advice. 70% described their training strategy as learning by doing. Necessary competencies included practical AI use, prompt competency and critical reflection. 77% expected common use of AI will increase overdiagnosis.

Discussion: FM trainees' interest in AI is increasing. Among participants, it is common sense, that use of AI and AI-literacy should be part of postgraduate medical training. Despite prompting, knowledge about common applications and its pitfalls as well as communicational skills on including AI into patient-doctor-communication could be crucial.

Conclusion: Postgraduate medical curricula should include training in AI-literacy and thereby increase support of future FPs as use of AI-models gets common in daily FM practice.

ID 882- Identifying essential professional activities for a future European curriculum in postgraduate Family Medicine

Fabian DUPONT [(1)] , Anna Katharina JUNG [(1)], Caroline VAN DER WALS [(1)], Aline KÖHLER [(1)], Kerstin SCHUSTER [(1)], Nele MICHELS [(2)], Aaron POPPLETON [(3)], Alex HARDING [(4)]

(1) Department Of Family Medicine, Saarland University, Homburg (saar), Germany, Homburg, Allemagne
(2) European Academy Of Teachers In General Practice/ Family Medicine (euract), Wonca, Brussels, Belgium, Brussels, Belgique
(3) School Of Medicine, Keele University, Keele, United Kingdom, Keele, Royaume-Uni
(4) University Of Exeter Medical School, Exeter, United Kingdom, Exeter, Royaume-Uni

Context: In the past years, Family Medicine has changed significantly. Due to increasing demands placed on general practitioners (GPs), appropriate training throughout Europe is vital. A unified European postgraduate curriculum in Family Medicine requires consensus on the discipline's core professional activities. Existing WONCA Europe and EURACT frameworks outline competencies but do not define an agreed set of practice-based activities.

Objectives: As a collaboration between EYFDM and EURACT, this study aims to identify essential professional activities of European Family Medicine and establish common ground for their acceptance across Europe.

Methods: Professional activities were gathered during a townhall workshop with GPs from fifteen European countries at the 2025 WONCA World Conference and are being analysed using Mayring's qualitative content analysis. A two-step Delphi-informed process involving practising GPs and young GPs will then determine the level of agreement across Europe.

Results: Analysis is ongoing. The study will deliver a consensus-based list of essential activities that represent routine Family Medicine across Europe. Final results will be available at the conference.

Discussion: While the emerging consensus is only one aspect of the long journey to a European curriculum, this study may inform the structure and practical implications of future training standards. The more practicing GPs are involved, the more realistic will be its implementation in European primary care.

Conclusion: The work will help build a practice-based European postgraduate curriculum and lay the groundwork for a future European specialty standard in Family Medicine.

ID 1905- Investigation of Internet Gaming Disorder and Non-Pharmacological Treatment Interventions in Adolescents

Ahmet EMIN, Didem KAFADAR

Istanbul University Cerrahpasa, Istanbul, Türkiye

Context: With the increasing popularity of digital media, concerns have grown regarding the "addictive" potential of internet use and video games, particularly among children and adolescents. Research suggests that individuals who engage in intensive video gaming may develop symptoms that lead to various functional and social problems in their lives.

Objectives: This study aims to examine meta-analyses and review studies focusing on internet addiction and internet gaming disorder in adolescents, as well as the treatment approaches applied, while also raising awareness of the subject.

Methods: A search of the PubMed scientific database using the terms "internet gaming disorder" or "internet addiction" yielded approximately 5200 publications published in the last two decades (2006 to 2026). When the keywords "adolescent" and "treatment" were added and the age range was limited to 13–18 years, 53 publications were identified. Meta-analyses and review studies were selected from this pool.

Results: The literature indicates that a variety of treatment approaches are available. Among the reported treatment apporaches there are non-pharmacological interventions such as mind-body exercise, physical activity interventions, cognitive behavioural therapy (CBT), peer support, family counselling, multi-level consultation programs conducted within the framework of individual counselling, family therapy, various therapeutic modalities, psychological interventions, internet addiction prevention programs, and group counselling based on the Adlerian approach. Combinations of different treatment modalities were found to be more beneficial and effective than single interventions.

Discussion: The reviewed studies emphasized the importance of treating comorbid conditions and initiating appropriate psychosocial interventions. From a clinical perspective, attention was drawn to the need for physicians to recognize the signs and symptoms of internet addiction. The findings suggest that public mental health approaches addressing adolescent developmental characteristics should be developed. Additionally, the need for further studies evaluating the effectiveness of school-based prevention programs was highlighted.

Conclusion: For the treatment of Internet Gaming Disorder in adolescents, identifying risk factors is a critical first step. Awareness among primary care providers, particularly family physicians, should be

increased regarding Internet Gaming Disorder and its associated psychopathologies.

ID 1319- When Intoxication Leads to Seizures: What Does the Emergency Department Reveal?

Ons EL MEJRI, Camilia JEDDI, Yosra AZZABI, Mohamed KILANI, Hafedh THABET

Department Of Emergency Medicine, Mahmoud Yaacoub Center For Urgent Medical Assistance, Tunis, Tunis, Tunisie

Context: Seizures are an infrequent complication of intoxication, it may be caused by a wide range of drugs and toxins.

Objectives: This study aimed to describe the epidemiological and clinical profile of patients presenting to the emergency department (ED) following acute intoxication associated with a seizure.

Methods: This was a retrospective study conducted over a 5 year period from October 2020 to September 2025, in the ED of xxx. We included patients aged from 14 and over who consulted for seizures after acute intoxication. Data regarding demographic, clinical history, characteristics of the intoxication type of molecule and presumed ingested dose (PID), clinical presentation, consultation delay, seizures before or during the consultation and the anti-seizure treatment used and were collected and analyzed.

Results: A total of 68 patients were included, predominantly male (58.8%), with a median age of 29 years [21–41] and a median consultation delay of 9 hours [3–24]. Substance misuse was reported in 39.7%, mainly cannabis (65.4%), pregabalin (46.2%), and cocaine (19%). The primary exposure route was drug ingestion (63.2%), followed by carbon monoxide (CO) inhalation (29.4%). Causes included recreational use (33.8%), accidental intoxication (32.4%), and suicide attempt (25%). The main substances implicated were pregabalin (16.4%), cannabis (9.6%), carbamazepine (8.2%). The mean PID was 806 ± 460 mg for pregabalin and 4,333 ± 3,215 mg for carbamazepine, with a mean plasma concentration of 11.7 ± 9.3 mg/L. In CO intoxication, mean carboxyhemoglobin was 16.4% ± 11.7%, and SpCO 10.9% ± 12.3%. Oxygen therapy was administered in 66.7% of CO cases, with hyperbaric oxygen in 20.8%. Most seizures (92.6%) occurred before consultation, with 93.7% resolving spontaneously, while 10.3% experienced seizures and 9% required antiepileptic treatment. Initial clinical examination was generally stable (median GCS 15, HR 87 bpm, SpO_2 98%). Regarding outcomes, 43.8% were admitted to intensive care, 31.3% discharged home, and 26.6% referred for follow-up, mostly to neurology and addiction services.

Discussion: These findings show that intoxication-related seizures occur mainly with recreational substance use or CO inhalation, with most episodes resolving spontaneously before medical evaluation.

Conclusion: This study highlights the need for improved prevention and monitoring of substances involved, and targeted neurological and addiction follow-up.

ID 1088- Chemsex in primary care: Qualitative study of general practitioners' perceptions of the phenomenon and views on care pathways in XXX

Romain VERDEAU, Lucas BEURTON-COURAUD, Vincent BORGNE, Morgane GUILLOU-LANDREAT, Marie BARAIS

Spurbo, Brest, France

Context: Chemsex refers to sexual activity under the influence of a psychoactive substance. Treatment in general practice is poorly described.

Objectives: This study aimed to analyze the perceptions of General Practitioners (GPs) in XXX regarding chemsex, its inherent problems and GPs' views on the users' care.

Methods: This qualitative study used semi-structured interviews with GPs in XXX. The interview guide explored risky sexual behavior, the use of drugs during sex, chemsex, and GPs' view of this behavior and its perception in their practice. A manual thematic analysis inspired by phenomenological interpretative analysis was conducted by two independent researchers.

Results: Nine GPs (four women) were interviewed. Data sufficiency was considered achieved after the ninth interview. GPs often poorly understood chemsex. Pre-exposure prophylaxis (PrEP) prescribers had a more precise perception of chemsex. GPs considered that early awareness of sexuality at school and in primary care could help limit young people's entry into chemsex. The changing relationship to sex, easy access to drugs and new communication modes were factors favoring this behavior.

Discussion: A similar study in larger cities would refine these results. A chemsex user interviewed lacked knowledge about the current healthcare offer and the role GPs could play in his care.

Conclusion: An analysis of perceptions of chemsex by GPs in XXX revealed that they often poorly understood the phenomenon. PrEP prescribers had a more precise perception of chemsex. GPs considered that early awareness of sexuality at school and in primary care was the main avenue for action to limit the entry of young people into chemsex. A similar study in large cities would help to clarify these results. An analysis of the transposition of certain specialized techniques into primary care could also be of interest. The chemsex user interviewed seemed to lack knowledge about the current healthcare offer and the role that GPs could play in his care.

ID 958- How do general practitioners feel about the use of performance-enhancing substances by their sporting patients?

Fanny SERMAN, Constantin DERVILLE, Charles CAUET, Sabine BAYEN, Gabrielle LISEMBARD

Department Of General Medicine, University Of Lille, Lille, France

Context: Although the health benefits of sport are well established, the contemporary emphasis on physical appearance and performance has contributed to the normalisation of performance-enhancing substances. Doping is often associated with elite athletes but most users are amateurs, and the associated physical and psychological harm is significant. General practitioners (GPs) are central to promoting physical activity and supporting athletes, yet they often feel insufficiently trained to address doping. This generates anxiety and uncertainty, as well as straining doctor–patient relationships.

Objectives: This study aimed to explore the experiences of GPs when dealing with patients who use doping substances.

Methods: A qualitative study based on grounded theory principles was conducted. Practising GPs were recruited through theoretical purposive sampling, beginning opportunistically and continuing by snowball sampling according to emerging data. Semi-structured interviews were conducted between February 2020 and January 2022. These were recorded, transcribed verbatim, anonymised, and returned to the participants for validation. Data collection, coding, and axial and selective analysis were performed using NVivo, with methodological triangulation. Ethical approval and data protection compliance were secured, and informed consent was obtained.

Results: Thirteen interviews were conducted, with data saturation being reached by the eleventh's. GPs reported emotional distress, biases, frustration and feelings of incompetence when confronted with doping use. Some GPs moved towards coaching behaviours, while others struggled with patients' denial, motivation, or external pressures. Many identified knowledge gaps and legal uncertainties. However, GPs could build therapeutic alliances through communication, empathy, and motivational interviewing. This allowed them to understand motivations, detect addictive patterns, and guide patients towards safer practices or behavioural change. Several emphasised the need for improved competence, multidisciplinary collaboration, and

greater awareness of anti-doping medical support services.

Discussion: GPs face professional, emotional and ethical tensions when managing doping users. Their responses evolve through self-reflection, communication and continuing education. However, structural barriers, particularly legal ambiguity and limited training, constrain optimal care.

Conclusion: GPs require greater support, training and awareness of specialist anti-doping services to meet the needs of patients who use doping substances. Improving communication skills and multidisciplinary collaboration could enhance patient safety, autonomy, and engagement, while also helping to reposition GP care within a sports health framework.

ID 679- Chemsex among women: specifities, risks, and expectations in general practice

Margaux DAVOUS, Luis PEREZ BENITEZ, Lou RICHELLE, Marion CAYN

Université Libre De Bruxelles, Bruxelles, Belgique

Context: Chemsex refers to the intentional use of psychoactive substances to initiate, intensify, or prolong sexual experiences. While mainly described among men who have sex with men (MSM), recent data suggest its emergence in other groups, including women. However, data concerning this population is limited.

Objectives: This study explores the characteristics of Chemsex among women and determines their needs and expectations in general practice.

Methods: We conducted semi-structured interviews with seven women engaging in Chemsex and living in XXX. We then analysed our findings by using Interpretative Phenomenology Analysis (IPA) and running our data through Atlas.ti software.

Results: Participants, who were socially integrated and of diverse sexual orientations, engaged in Chemsex as part as a broader pattern of recreational substance use. They consumed various substances and relied on self-directed risk management. Motivations included seeking disinhibition, emotional connection, intensified sexual experiences, and coping with pre-existing sexual difficulties or sexual dysfunctions. Reported negative effects included somatic issues (e.g., cystitis and genital pain), psychological consequences, substance use disorders, and altered relationships with sexuality. Consent was a central concern, particularly during group sex encounters and under the influence of central nervous system depressant substances. Participants also expressed a need to identify with the practice, and expected non-stigmatising, informed, and harm-reduction-oriented attitudes from primary care providers as well as addressing sexuality in consultations.

Discussion: The present study demonstrates that women engaging in chemsex face specific physical, psychological, and sexual risks, yet these risks remain largely invisible due to MSM-centred representations and their social integration, which limits contact with specialised services. This invisibility is a significant contributing factor to the unmet health needs of individuals. Due to their accessibility and non-stigmatizing approach, general practitioners are perceived as key actors in helping individuals identify their practices and adopt risk-reduction strategies.

Conclusion: Chemsex among women encompasses diverse practices involving specific physical, psychological, and sexual health-related risks. The participants in our study experienced a threefold invisibilisation : as women, as socially integrated users, and as Chemsex users. The study underscores the need to broaden representations of Chemsex to include women's experiences and to strengthen the role and training of general practitioners.

ID 837- From stigma to solidarity: Early screening and follow-up of alcohol dependence in general practice

Daniela KRASIMIROVA, Zhenya RUSEVA, Valentina MADJOVA

Medical University Of Varna, Razgrad, Bulgarie

Context: Alcohol use disorder (AUD) is a major risk factor for morbidity and mortality, yet despite its high prevalence, effective prevention and treatment in primary care remain insufficient.

Objectives: The aim of this clinical study is to present a practical model for monitoring and managing AUD as a key risk factor for the onset or complication of socially significant diseases within the primary outpatient care setting.

Methods: This is a prospective, population-based cohort study conducted in Razgrad, Bulgaria, between 2023 and 2025. It involved 62 men with established alcohol abuse/dependence who were divided into two cohorts: one with a new diagnosis of hypertensive heart disease at the initial visit (n=27), and the other without existing socially significant diseases (n=35). Participants were monitored for 10 specific parameters. Statistical analysis utilized descriptive statistics, comparative correlation analysis, and logistic regression.

Results: The statistical analysis established strong and significant associations between several studied parameters. Symptoms of physical and mental dependence, as well as elevated gamma-glutamyltransferase (GGT) levels, showed a very clear link with adverse health consequences ($p<0.05$). Interestingly, initial values of pulse and arterial pressure did not show such a link. Logistic regression identified GGT, HDL-cholesterol, and symptoms of physical dependence as key independent risk factors for the development of chronic diseases and cardiovascular mortality ($p<0.001$).

Discussion: The findings regarding the lack of significant differences in the initial clinical presentation between the examined cohorts, and the established biochemical and clinical predictors for the development of socially significant diseases in AUD, are consistent with existing scientific literature. These results underscore the potential for early intervention by general practitioners.

Conclusion: Chronic alcohol consumption leads to a significant deterioration of numerous health indicators and determines the necessity of early, targeted prevention and intervention strategies within general practice. The proposed model facilitates systematic follow-up, helping to de-stigmatize the condition and foster a supportive, solidarity-based approach to patient care.

Department Of Pulmonology, University Of Groningen, University Medical Center Groningen, The Net, Groningen, Pays-Bas

Context: Digital tools may support healthcare professionals in providing guideline-directed management for patients with allergic rhinitis (AR).

Objectives: This study aimed to develop and implement the Respiratory Allergy Optimiser (RAO), a digital decision support tool based on treatment recommendations from existing clinical AR guidelines, and to evaluate its clinical effectiveness in reducing AR symptom severity.

Methods: The AERO study was an interventional study conducted in 11 general practices (GPs) across the Netherlands (August-November 2025). Adult patients (≥18 years) with a diagnosis of allergic rhinitis and/or allergic conjunctivitis (AC) and/or prescribed AR medication within the previous three years, were included. The RAO was used during a GP consultation, during which AR/C symptom severity and management were assessed using a visual analogue scale (VAS)(0-100mm, complaints past 7 days) and questions. Two weeks later, patients completed a follow-up survey including the VAS. User experience data were collected from healthcare professionals and patients.

Results: In total, 104 patients with rhinitis (mean age 49.0 years (SD 16.5), 61% female) were included. Mean VAS score was 35.1 mm (SD 25.6) at baseline and 35.8 (SD 25.4) at follow-up. For 30% of patients, the advice was to continue the current treatment, while for 50% the advice was to step up treatment. In 15 (14.4%) patients, step up plus allergy immunotherapy was advised. In patients with uncontrolled rhinitis (VAS>50mm)(n=33), VAS scores significantly decreased two weeks after the study consultation with the RAO (65.7 mm (SD 9.7) vs 47.7 (SD 22.0); p=0.003).

Discussion: In 70% of patients, the RAO suggested changes toward more guideline-directed treatment. Among patients with uncontrolled rhinitis, use of the RAO during consultation was associated with reduced symptom severity after two weeks. User experience was generally positive among patients and healthcare professionals, identifying opportunities for further improvement.

Conclusion: In Dutch general practice, the Respiratory Allergy Optimiser supported identification of opportunities to improve allergic rhinitis management, particularly by addressing poor disease control.

ID 1627- Digital Remote Monitoring to Improve Asthma Control in Primary Care

Anara KOSHUKEEVA

Family Medicine, Primary Care, Bishkek, Kirghizistan

Context: Bronchial asthma is a chronic respiratory disease requiring regular assessment of disease control and long-term follow-up. In primary care, limited access to frequent visits and high workload may negatively affect adherence, self-management, and timely adjustment of therapy. Digital remote monitoring tools may support continuity of care and patient engagement between visits.

Objectives: The objective of this study was to evaluate the effect of a digital remote monitoring program on asthma control, lung function, and medication use over a six-month period in a primary care setting, compared with usual car

Methods: A prospective observational study included 82 adult patients with bronchial asthma, divided into a remote monitoring group (n = 40) and a usual care group (n = 42). All participants underwent baseline clinical assessment. Patients in the remote monitoring group received structured asthma self-management education and peak flow meters for home monitoring. Follow-up was supported by a digital remote monitoring system that automated monthly reminders and collected patient-reported outcomes via mobile messaging. Asthma control was assessed using the Asthma Control Questionnaire (ACQ-5). Peak expiratory flow (PEF) and information on asthma medication use were recorded during the six-month follow-up period. Appropriate parametric and non-parametric statistical tests were applied.

Results: At baseline, the mean ACQ-5 score was 2.3, indicating poor asthma control in the majority of patients. After six months of follow-up, patients in the remote monitoring group demonstrated a significant improvement in asthma control. The mean ACQ-5 score decreased from 2.3 to 1.1 ($p < 0.001$), reflecting a clinically meaningful improvement. Lung function also improved during the observation period, with mean PEF increasing from 330 L/min to 371 L/min

Discussion: The improvement in asthma control occurred without major changes in

pharmacotherapy, suggesting that enhanced monitoring, patient education, and self-management played a key role.

Conclusion: Digital remote monitoring was associated with improved asthma control over six months in primary care. Automated follow-up and home peak flow monitoring supported self-management without increasing medication burden.

ID 1368- EXpiRA+: outcomes of a primary-care pulmonary rehabilitation programme for patients with Chronic Obstructive Pulmonary Disease

Pedro Daniel FERNANDES CARDOSO [1] , Cecília Maria VILAS BOAS SOARES [2], Marina PEREIRA RODRIGUES [3], Joana PEREIRA [4], Maria Manuela SILVA [4], Helena Otilia Silva MARTINS [4], Cláudia Alexandra Parreira BULHÕES [3]

(1) Usf Vida+, Uls Braga; Escola De Medicina Da Universidade Do Minho-Braga (portugal), Braga, Portugal
(2) Usf Vida+, Uls Braga, Braga, Portugal
(3) Usf Vida+, Uls Braga; Escola De Medicina Da Universidade Do Minho, Braga, Portugal
(4) Ucc Vila Verde, Uls Braga, Braga, Portugal

Context: Pulmonary rehabilitation (PR) is a key intervention for chronic obstructive pulmonary disease (COPD), yet its availability in XXX primary care remains limited, creating a gap between guideline recommendations and real-world care. The EXpiRA+ programme was developed and implemented in four primary healthcare units to improve exercise tolerance, functional capacity, symptoms, and psychosocial wellbeing in COPD patients.

Objectives: To describe changes in functional performance, dyspnea, quality of life, psychological status and multidimensional prognosis among participants in the EXpiRA+ programme.

Methods: A longitudinal observational study was conducted between January 2022 and April 2025, including 18 adults with COPD. The intervention comprised an 8-week multimodal PR programme, integrating structured exercise training and educational sessions. Assessments were performed at baseline, 8 weeks and 6 months. Outcomes included 6-Minute Walk Test (6MWT), 1-Minute Sit-to-Stand Test (1-STS), London Chest Activity of Daily Living (LCADL), COPD Assessment Test (CAT), modified Medical Research Council dyspnoea scale (mMRC), Hospital Anxiety and Depression Scale (HADS), and the BODE Index. Medians (P25–P75) were calculated. Wilcoxon signed-rank and Friedman tests were used.

Results: Significant improvements from baseline to 8 weeks were observed in exercise capacity [6MWT: 380 (297-525); 463 (390-525); p=0.012; 1-STS: 16.5 (11.5-24); 27 (20.5-39); p=0.005)], symptoms [CAT: 17 (9.5-24); 5 (3.5-19); p=0.012; mMRC: 2 (1-2); 1 (1-2); p=0.002)], and psychological well-being [HADS: 12.5 (9-16); 8 (4.5-12); p=0.018)]. At 6 months, improvements were largely retained, although not all remained statistically significant [6MWT: 380 (297-525); 480 (420-551); p=0.130; 1-STS: 16.5 (11.5-24); 31 (15-42); p=0.126; CAT: 17 (9.5-24); 6 (4-10); p=0.022; mMRC: 2 (1-2); 1 (0-2); p=0.011); HADS: 12.5 (9-16); 4 (3.5-9); p=0.017)]. Non-significant trends were observed for LCADL and the BODE Index. Friedman tests indicated significant global changes across time for 1-STS, CAT, mMRC, and HADS.

Discussion: EXpiRA+ produced clinically meaningful gains in functional performance, dyspnea, health status and psychological wellbeing, with substantial retention at 6 months. The programme demonstrates operational feasibility and potential reproducibility across multiple primary care units.

Conclusion: EXpiRA+ was associated with sustained improvements across several clinical domains and represents a feasible PR model deliverable in XXX primary care.

ID 761- COPD Severity and Depression in Primary Care: A Cross-Sectional Study

Bahar GULER FILIZ, Ozlem POLAT, Zübeyr OGUT

Department Of Family Medicine, Bakırköy Dr. Sadi Konuk Training And Research Hospital, Istanbul, Türkiye

Context: Chronic Obstructive Pulmonary Disease (COPD) is a progressive condition that significantly reduces quality of life and is frequently accompanied by psychiatric comorbidities, particularly depression. In primary care settings, unrecognized depressive symptoms may worsen disease perception, treatment adherence, and overall outcomes. Understanding the association between COPD severity and depression, and the sociodemographic factors influencing this relationship, is essential for improving patient-centered management strategies in family medicine.

Objectives: To evaluate the relationship between COPD severity and depression among adult COPD patients presenting to family medicine outpatient clinics, and to identify sociodemographic variables associated with depressive symptoms.

Methods: This descriptive cross-sectional study was conducted between June 1 and December 1, 2024, in the Family Medicine outpatient clinics of a tertiary training and research hospital. The study included 125 adult patients diagnosed with COPD. Data were collected using a 10-item sociodemographic questionnaire, the 8-item COPD Assessment Test (CAT), and the 21-item Beck Depression Inventory (BDI). A CAT score ≥21 was accepted as indicating high COPD severity, and a BDI score ≥17 was considered indicative of depression. Data were analyzed using IBM SPSS 20, with statistical significance set at $p<0.05$.

Results: Among the participants, 76.8% were male (n=96), and the mean age was 66.99±8.32 years. Depression was detected in 36.8% (n=46) of patients. Based on CAT scores, 32.8% (n=41) were classified in the high-severity group. No significant association was found between depression and education level, income, smoking status, or comorbid chronic diseases ($p>0.05$). Both CAT and BDI scores increased with age, and higher CAT scores were significantly associated with higher BDI scores ($p<0.05$). Regular COPD follow-up was not significantly associated with depression.

Discussion: Findings indicate that depressive symptoms are common among COPD patients and appear to increase with disease severity. Sociodemographic factors showed no significant impact, suggesting that clinical parameters may play a more dominant role.

Conclusion: Depression is more prevalent in COPD patients compared with the general population, and its likelihood increases with greater disease severity. Routine use of the CAT in primary care may facilitate early recognition of depressive symptoms. Integrating psychosocial assessment into regular follow-up could improve quality of life and support comprehensive COPD management.

ID 700- Improving management quality of chronic obstructive pulmonary disease in primary care: findings from a 2024 clinical audit

Tamar GABUNIA, Irine KAROSANIDZE, Nato SHENGELIA, Eka GIGASHVILI, Nana GUDAVADZE, Ushangi KILADZE

National Family Medicine Training Center, Tbilisi, Géorgie

Context: Chronic obstructive pulmonary disease (COPD) remains one of the least diagnosed and undertreated chronic conditions globally and nationally. In 2024, a comprehensive clinical audit was conducted across nine primary care teams to evaluate the quality of COPD management, identify system gaps, and compare current practice with evidence-based national protocols updated in 2023. The audit aimed to assess diagnostic accuracy, symptom monitoring, appropriateness of treatment, prevention activities, and follow-up patterns.

Methods: A full audit of all 180 COPD cases recorded in 2024 was undertaken. Data were retrospectively extracted from electronic medical records using predefined indicators reflecting structure, process, and outcomes of care. Analysis covered demographics, smoking status, spirometry, GOLD-based severity assessment, symptoms (CAT, mMRC), treatment alignment, vaccination, referrals, and hospitalization. Strengths of the audit included comprehensive case inclusion and multidisciplinary review; limitations included inconsistent

documentation, limited availability of spirometry, and variable data completeness across teams.

Originality: This audit represents one of the most detailed analyses of COPD management conducted in a national primary care network. Unlike previous fragmented reviews, this audit combined structure, process, and outcome indicators to evaluate real-world clinical per

Lessons learned and future implication: Findings revealed significant underdiagnosis (prevalence 0.9%), limited symptom assessment (CAT/mMRC documented in ~11%), low use of spirometry (18%), inconsistent GOLD classification, and suboptimal treatment alignment (34%). Preventive care (especially

Discussion: The audit demonstrated substantial variability across teams, highlighting gaps in diagnostic and monitoring practices, in continuity of care, prevention, and documentation. These findings indicate opportunities for structured quality improvement supported by protocols, supervision, and targeted training.

Conclusion: The 2024 audit underscored the need for systematic improvements in diagnosis, monitoring, treatment alignment, and preventive care. Enhancing structured workflows and strengthening team-based practice can significantly improve patient outcomes and align primary care with international COPD standards.

Taking care of the elderly

ID 2234- Community Solidarity and Mobilization as Tools Against Depression and Dementia in Rural Areas of Crete

Dimitrios VASILAKIS [(1)] , Nikiforos TRIANTOULIS [(1)], Alexandros Charalampos ZAMPETAKIS [(2)], Christina ARCHONTAKI [(1)], Martha KARYDA [(1)], Ilias Viktor TSIRIGAS [(1)], Marios CHRONAKIS [(1)], Stavros SPANOUDIS [(1)]

(1) Health Care Center Of Agia Varvara, Heraklion, Grèce
(2) University Of Crete, Heraklion, Grèce

Context: Rural areas of Crete are experiencing population ageing, social disadvantage, and growing isolation among older adults. Access to health and social care services is limited, and primary care often operates with few staff and resources. As a result, general practitioners are frequently required to manage depression, and early-stage dementia under challenging conditions and with little external support. In this setting, our community primary care practice aimed to involve the local social and cultural environment in addressing mental health and cognitive problems among older adults.

Methods: Recognizing the presence of cultural associations and informal community networks, the primary care team collaborated with local groups, volunteers, and residents to mobilize the community and create inclusive spaces for older adults.The intervention included memory walks, creative workshops (ceramics, loom weaving, knitting), choir singing, traditional dance, music lessons, and a weekly “memory café” with cognitive exercises, games, and social interaction. All activities were culturally familiar, locally organized, and low-cost.Participants were assessed at baseline and after six months using validated tools: the Geriatric Depression Scale (GDS-13), the Greek version of the Instrumental Activities of Daily Living (IADL) scale, and the Mini-Mental State Examination (MMSE).

Originality: This experience is innovative in that it treats the community itself as a therapeutic resource. It integrates social participation and cultural activities into routine primary care practice, offering a practical response to limited resources while remaini

Lessons learned and future implication: The experience showed that rural communities have the ability to support healthy ageing when properly engaged. Future steps may include longer follow-up and closer integration with routine primary care services.

Discussion: Participants who consistently engaged in the activities demonstrated improvements in mood, cognitive performance, and functional independence. Social connection and meaningful

engagement appeared to mitigate loneliness and depressive symptoms, supporting non-pharmacological approaches in early cognitive decline.

Conclusion: Community solidarity and mobilization can represent powerful tools in addressing depression and early-stage dementia in limited resources rural settings. This case demonstrates the potential for community driven interventions to complement clinical care and expand the therapeutic role of primary care practice.

ID 1584- Primary Care Integration in Nursing Homes and Its Impact on Resident Outcomes: A Cross-Sectional Study in Catalonia

Mar ALVAREZ PEDREROL [(1)] , Leonardo MÉNDEZ-BOO [(2)], Anna REÑÉ [(2)], Marta TORRRES-LÓPEZ [(3)], Eduardo HERMOSILLA [(2)], Ermengol COMA [(2)], Josep VIDAL-ALABALL [(4)], Catia NICODEMO [(5)]

(1) Fundació Institut Universitari Per A La Recerca A L'atenció Primària De Salut Jordi Gol I Gurina (idiap Jordi Gol), Barcelona, Espagne
(2) Primary Care Services Information System (sisap), Institut Català De La Salut (ics), Barcelona, Espagne
(3) Agency For Health Quality And Assessment Of Catalonia (aquas), Barcelona, Espagne
(4) Unitat De Recerca I Innovació En Atenció Primària, Gerència D'atenció Primària I A La Comunitat De Catalunya Central, Barcelona, Espagne
(5) Nuffield Department Of Primary Care Health Sciences, University Of Oxford, Oxford, Royaume-Uni

Context: Older adults living in Nursing Homes (NHs) have complex healthcare needs that require close coordination with primary care teams (PCTs). In Catalonia, recent policies have promoted closer collaboration between primary care teams (PCTs) and NHs, although integration levels remain heterogeneous. Understanding whether higher integration translates into better resident outcomes is essential for guiding service planning and resource allocation.

Objectives: To evaluate whether greater primary care integration with nursing homes is associated with improved resident health outcomes and reduced healthcare utilization.

Methods: This cross-sectional study analyzed 612 nursing homes for older adults in Catalonia. Primary care integration was measured using a composite integration maturity score derived from paired surveys completed by each NH and its corresponding PCT. Homes were categorized into quintiles (Q1–Q5), with Q5 representing the highest integration. Outcomes included hospital admissions, polypharmacy (≥10 medications), emergency hospital visits, primary care emergency consultations, mortality, days at home, and continuity of care. Multivariable mixed-effects models accounted for clustering at the PCT level and were adjusted for residents' age, sex distribution, socioeconomic status, clinical complexity (GMA), and the number of residents per NH and per PCT.

Results: Integration levels varied widely across nursing homes. Compared with Q1, the highest integration group (Q5) demonstrated significantly fewer hospital admissions (−14.4%, p=0.019), lower rates of polypharmacy (−17%, p=0.047), and fewer emergency hospital visits (−6.8%, p=0.020). Improvements were already detectable at intermediate integration levels, particularly from Q3 onward. No significant associations were observed for mortality, days at home, primary care emergency visits, or continuity of care.

Discussion: While causality cannot be determined from this cross-sectional study, the consistency of effects across outcomes suggest that higher integration contributes to more proactive and coordinated care, reducing avoidable healthcare use. Further longitudinal research is needed to determine whether integration leads to long-term reductions in healthcare use.

Conclusion: Higher levels of integration between primary care teams and nursing homes are associated with reductions in healthcare utilization and polypharmacy, suggesting that more coordinated care models may enhance proactive management and improve resident outcomes. Strengthening integrated care strategies could support more efficient, resident-centered care for institutionalized older adults in Catalonia.

ID 498- Characteristics, Organization, and Communication of Multidisciplinary Primary Care Teams Implementing the ICOPE Program

Antoine CABROL, Antoine JURADO, Florence DURRIEU, Emile ESCOURROU, Julie DUPOUY, Bruno CHICOULAA

Department Of Family Medicine, Toulouse, France

Context: The WHO's Integrated Care for Older People (ICOPE) program is being implemented worldwide to promote healthy ageing. It aims to preserve intrinsic capacities (mobility, cognition, nutrition, mood, vision, and hearing) in adults aged 60 and over. Structured into five steps (screening, comprehensive assessment, personalized care plans, follow-up and community engagement) ICOPE places multidisciplinary primary care practices (MPCPs) at the forefront in France. Organizational and interprofessional collaboration challenges remain barriers to effective implementation. The ongoing INEPPS study uses a mixed-methods design to assess completed Personalized Care Plans (PCPs) and evaluate models of interprofessional cooperation and PCP negotiation. This work presents initial INEPPS results and focuses on interprofessional dynamics, hypothesizing their impact on ICOPE rollout and outcomes in primary care.

Objectives: The study objective was to analyze the characteristics, organizational structure, and modes of communication of MPCP teams involved in the ICOPE program.

Methods: A cross-sectional study examined multidisciplinary organization and communication within the ICOPE program. MPCPs implementing ICOPE in Occitanie and included in the INEPPS study were surveyed with a standardized 32-item electronic questionnaire, assessing team characteristics, organizational structure, and communication methods. Descriptive analysis, mapping, and profiling of teams were performed.

Results: Fourteen multidisciplinary practices were surveyed (mean staff: 25; mean patients: 6,529). General practitioners (GPs) were most frequently cited as the driving force behind program adoption. All practices used shared health IT systems, with most interprofessional communication occurring via this system. For Step 1, 57% of practices involved a nurse and 57% a physical therapist; for Step 2, nurses led in 64% of practices versus 14% for physical therapists. GPs were the main contributors to PCPs (57%), though active negotiation with the GPs occurred in only 35% of practices. Systematic follow-up was organized by half of practices.

Discussion: This study offers new insights into multidisciplinary team organization and real-world ICOPE implementation, however, its cross-sectional design and limited sample size remain important limitations. Further research is needed to link organization and communication to patient outcomes.

Conclusion: This study found variability in ICOPE implementation, particularly in team structures and professional roles. Systematic follow-up was inconsistently organized across practices. Understanding different multidisciplinary approaches could help enhance the program.

ID 1094- Quality of Life, Comorbidities, and Biopsychosocial Conditions of Patients Aged 95 Years and Older in a Primary Care Center in Barcelona

Blanca RAITERI BOIRA, Marta CATALAN ADELL

Cap Casanova, Barcelona, Espagne

Context: The growing number of individuals aged 95 years and older poses new clinical and social challenges in primary care. Despite its relevance, data on their characteristics in community settings remain scarce.

Objectives: The primary objective was to describe clinical, functional, and social features of individuals aged ≥95 in 2022, with a secondary aim to explore comorbidity, polypharmacy, and family support patterns.

Methods: We conducted an observational, cross-sectional, descriptive study based on clinical records from CAP Casanova, an urban primary care center in

Barcelona. Participants aged ≥95 years during 2022 were included, and those with unavailable data were excluded. No sample size calculation was required, as this was a population-based study. Variables included demographics, family history, lifestyle, comorbidity, medications, health status, home care, hospitalizations, and function. Data were anonymized, and ethics approval was obtained from the Ethics Committee of Hospital Clínic de Barcelona (HCB.2022.0366_).

Results: Of 32,154 registered patients, 204 met inclusion criteria, and 182 were analyzed. The sample included 46 men (25.3%) and 136 women (74.7%), with a mean age of 97 years and mean Charlson index of 1.67. Regarding comorbidities, 73.6% had hypertension, 83.5% dyslipidemia, 85.1% were non-diabetic, 71.4% had no chronic kidney disease, 93.37% had no ischemic heart disease, 99.4% had never had a stroke, and 81.87% did not have dementia. Smoking prevalence was 10.8%, with 9.6% former smokers; 69.89% abstained from alcohol. Polypharmacy affected 25.82%, 39.01% used psychotropic drugs, and 64.3% had relatives aged ≥90. Overall, the cohort showed moderate comorbidity, low medication burden, preserved function, and strong family support.

Discussion: The predominance of women and low smoking rates align with known longevity patterns. Moderate comorbidity, limited polypharmacy, and moderate psychotropic use suggest a relatively healthy, community-dwelling oldest-old population with preserved functional independence. High familial longevity highlights genetic and shared environmental influences. Excluding participants with missing data was a limitation. Overall, the profile reflects typical healthy aging in this age group.

Conclusion: Adults aged ≥95 years in our population maintain functional independence and a low prevalence of modifiable risk factors. Recognizing these profiles may guide care strategies tailored to the needs of extreme aging.

ID 264- Association of long-term frailty trajectory and mortality among patients with chronic lung diseases

Hui ZHAO, Li QI

The Department Of Health Management, Center Hospital Of Dalian University Of Technology, Dalian, Chine

Context: The significance of frailty in the field of respiratory diseases has been recognized recently. Patients with chronic lung disease (CLDs) demonstrate elevated frailty prevalence and this condition strongly predicts adverse outcomes. However, evidence regarding the association between long-term frailty trajectories and mortality in this population remains limited.

Objectives: To examine the association between dynamic frailty trajectories and all-cause mortality in community-dwelling adults with CLDs.

Methods: This cohort study analyzed data from the China Health and Retirement Longitudinal Study (CHARLS) and Health and Retirement Study (HRS) in the US. The group-based trajectory model (GBTM) was used to identify potential frailty trajectories. To analyze the association between frailty trajectories and mortality, Cox proportional hazards regression models was used to calculate hazard ratios (HRs) with 95% confidence intervals (CIs). The subgroup analyses and several sensitivity analyses were used to confirm the main result.

Results: The study included 1716 CHARLS participants and 1668 HRS participants. Three frailty trajectories were identified: low level group, moderate level group, and high level group. During follow-up, there were 255 deaths in the CHARLS and 633 deaths in the HRS. Compared with low level group, high level group showed the highest mortality risk (HR, 2.51; 95% CI, 1.77-3.56), followed by moderate level group (HR, 1.54; 95% CI, 1.09-2.18). In the HRS, similar results were observed. Participants in moderate and high level groups had 54% (HR=1.54; 95% CI=1.22-1.95) and 143% (HR=2.43; 95% CI=1.92-3.07) higher mortality risk, respectively.

Discussion: In this analysis of two prospective cohorts, we observed a strong association between frailty trajectories and mortality risk among individuals with CLDs. Those with a trajectory characterized by high baseline frailty and rapid progression faced a significantly higher risk of mortality compared to individuals with low and stable frailty. These findings underscore that the dynamic change in frailty is a powerful indicator of

mortality risk. Early screening and proactive management of frailty are crucial in this vulnerable population.

Conclusion: Frailty trajectories demonstrated significant associations with mortality risk among adults with CLDs. Implementing frailty screening in CLDs management may help identify high-risk patients for targeted interventions.

Taking care of the vulnerable

ID 2250- Listening beyond glycaemia: Empowering vulnerable patients with type 2 diabetes through culturally sensitive family medicine

Joana MATOS BRANCO [(1)] , Alexandra PINTO ROCHA [(1)], Cristiana LOPES CRAVEIRO [(1)], Cintia RAMOS ALVES [(1)], Érica TRIBUNA [(1)], Inês MARQUES PIRES [(1)], José João LIMA [(1)], Inês FERRAZ DE OLIVEIRA [(2)]

(1) Usf Águas Livres, Uls Amadora Sintra, Lisboa, Portugal
(2) Diabetologie-Endocrinologie, Humani-Chu Charleroi-Chimay, Charleroi, Belgique

Context: Type 2 diabetes disproportionately affects socioeconomically disadvantaged and migrant populations, where disease management is complicated by social vulnerability, cultural beliefs, low health literacy and limited access to resources. In culturally diverse primary care settings, glycaemic control cannot be addressed uniquely through biomedical targets. Humanistic, person-centered and community-oriented family medicine is essential to empower patients, support self-management and promote equitable chronic care, reflecting the values of liberty and fraternity.

Methods: This practice-based case presents a reflective analysis of routine type 2 diabetes appointments in a Family Health Unit located in an economically deprived area with a high proportion of patients of low socioeconomic status and African migrants. The appointments focused on communication strategies, cultural sensitivity, exploration of patients' illness narratives, identification of psychosocial barriers to diabetes control, and articulation with community and social resources. Informal patient feedback and multidisciplinary team discussions supported the intervetion.

Originality: This case illustrates how "listening beyond glycaemia" functions as a deliberate clinical approach. By integrating narrative medicine, cultural humility, and shared decision-making, family physicians move beyond guideline-driven targets to address the dee

Lessons learned and future implication: Active listening and culturally sensitive communication enhance trust, engagement, and adherence to diabetes care plans. Recognizing social determinants of health, such as food insecurity, employment instability, and housing challenges, enables family phy

Discussion: Person-centered care and sensitivity to the culture of people with diabetes strengthen therapeutic relationships and continuity of care in socially complex contexts. Family physicians can integrate biomedical management with psychosocial and community dimensions. However, maintaining this approach requires time, institutional support, and interprofessional collaboration.

Conclusion: Listening beyond glycaemia is fundamental to empowering vulnerable patients with type 2 diabetes, supporting self-management, improving adherence, and reducing health inequalities. Humanistic, person-centered, and community-oriented family medicine fosters meaningful care, trust, and equity, embodying the principles of liberty and fraternity central to family medicine.

ID 2233- Providers or patients? A scoping review of the "invisible" LGBT healthcare workforce in Turkish medical literature

Taha Kaan ISLEYICI

Oxford University Hospitals Nhs Trust, Oxford, Royaume-Uni

Context: Research on LGBT health in Turkey has expanded over the past two decades within a culturally conservative context shaped by policy shifts, including withdrawal from the Istanbul Convention. Most studies focus on healthcare professionals' attitudes towards LGBT patients, while experiences of LGBT healthcare professionals remain largely absent, contrasting with international evidence that sexual and gender minority clinicians face more discrimination and adverse career outcomes.

Objectives: This scoping review assessed the visibility of LGBT healthcare professionals in Turkish medical literature. Specifically, it aimed to examine the balance between studies of providers' attitudes towards LGBT patients and those addressing healthcare workers' professional experience by exploring evidence regarding recruitment, retention, wellbeing or career trajectories.

Methods: A scoping review of PubMed-indexed literature published between 2000 and 2025 was conducted. Searches combined Turkey-related terms, healthcare professional roles, and LGBT-related keywords. Eligible studies involved healthcare professionals or students, assessing LGBT-related attitudes, education, knowledge, or workplace issues. Of 65 full-text articles screened, 19 met inclusion criteria and intended to be categorised into three domains: attitudes towards LGBT patients, educational curricula and interventions, and healthcare workforce experiences.

Results: No study explicitly investigated the LGBT healthcare workforce. Four studies incidentally included LGBT-identified participants, representing 4.4% of a combined sample of ~2,358 individuals, and analysed them only in relation to patient care attitudes. Literature was dominated by attitude assessments (N = 8,400). A pooled analysis of six studies (n = 4,486) using the Hudson and Ricketts Homophobia Scale (standardised to 1–6) yielded a mean of 3.69, indicating moderately homophobic attitudes, higher among men. Other instruments indicated moderately positive attitudes or professionals being "on the verge of homophobia." Studies consistently reported a lack of standardised LGBT health curricula.

Discussion: Turkish medical literature is hyper-focused on the ideology of LGBT health but blind to the professionals providing it. The incidental presence of LGBT participants demonstrates that the workforce exists, yet these professionals remain "research ghosts" present in data but ignored by researchers. This silence enforces structurally imbalanced heteronormative assumptions.

Conclusion: Future studies must shift from repeated attitudinal assessments to workforce-centred research, addressing both patient care and the organizational conditions that support equitable practice for LGBT healthcare professionals.

ID 1895- Impact of Social Health Inequalities on the Nutritional Status of the French population : a narrative literature review

Maria GHALI

Département De Médecine Générale, Angers, France

Context: Social health inequalities (SHIs) in France, among the highest in Europe and continue to widen, contributing to a marked social gradient in health. Nutrition, understood as both dietary intake and physical activity, is a major determinant in health and a central target of public health policies. Despite national strategies such as the French National Nutrition and Health Programm (PNNS), nutritional inequalities persist.

Objectives: This study aimed to describe the impact of SHIs on the nutritional status of the French population and to identify key determinants and barriers to improvement.

Methods: A narrative literature review was conducted in accordance with PRISMA guidelines. Bibliographic databases (PubMed, Cochrane, Cairn, LiSSa, and CISMeF) and grey literature were searched up to May 2024. Articles focusing on the French population were included. Nutritional status

was assessed through dietary quality, prevalence of overweight and obesity, and levels of physical activity and sedentary behaviour.

Results: A total of 45 articles were included, most based on large national surveys (INCA3, ESTEBAN, ObEpi-Roche 2020, and ABENA). A lower socioeconomic position was consistently associated with poorer dietary quality, higher intake of sugar-sweetened beverages, and increased food insecurity. These populations also showed higher prevalences of overweight and obesity, lower levels of physical activity, and more sedentary behaviour. Educational level emerged as a strong determinant of nutritional outcomes, often more influential than income or occupational status.

Discussion: The findings indicate that nutritional inequalities result from multiple, interconnected determinants. Economic constraints remain central, with food expenditure frequently acting as an adjustment variable, favouring low-cost and ultra-processed foods. Limited geographic access to healthy foods, physical activity facilities, and preventive healthcare, further exacerbate disparities. Cultural norms, nutrition transition, food acculturation, and targeted marketing of unhealthy foods disproportionately affect socially vulnerable populations. This review provides an updated and comprehensive overview of a topic that remains underexplored in the French context. However, the analysis relies largely on a limited number of national surveys, with heterogeneous methodologies and populations.

Conclusion: SHIs have multifactorial impact on nutritional status in France. In primary care, therapeutic patient education and structured individual or group-based support programmes appear particularly relevant to support sustainable lifestyle changes among socially vulnerable populations.

Taking care of the vulnerable

ID 1741- Social determinants of dental care utilisation and oral health in a low-income rental flat community

Clement You Qi GWEE [(1)] , Jolene Xin Yi YEE [(2)], Gabriel Keng Yan KENG [(3)], Charlene Enhui GOH [(3)], Lay Hoon GOH [(4)]

(1) Lee Kong Chian School Of Medicine, Nanyang Technological University, Singapore, Singapour
(2) Yong Loo Lin School Of Medicine, National University Of Singapore, Singapore, Singapour
(3) Faculty Of Dentistry, National University Of Singapore, Singapore, Singapour
(4) Division Of Family Medicine, Yong Loo Lin School Of Medicine, National University Of Singapore; Department Of Family Medicine, National University Health System, Singapore, Singapour

Context: Despite dental subsidies and widespread screening services, disparities in dental care use and oral health persist. National data indicate that over one-third of residents have untreated dental caries, with a disproportionate burden among lower socioeconomic status groups. Socio-economic barriers and engagement with medical primary care may shape oral health behaviours, yet evidence in XXX is limited.

Objectives: To examine how socio-economic access and healthcare engagement influence self-perceived oral health, oral function, and dental care utilisation in a rental flat community in XXX.

Methods: A cross-sectional survey of rental flat residents aged ≥40 was conducted at a health screening. Participants reported self-perceived oral health and function, dental visit frequencies, and socio-demographic data. We used ordinal logistic regression to examine the associations between social factors and survey outcomes.

Results: Among 116 participants (50.8% female; mean age 64±10.7), 21.6% reported poor/very poor oral health, while 19.6% faced significant-to-extreme difficulty chewing. 37.5% visit the dentist at least once a year, whereas 19.0% couldn't recall their last visit and 31.0% only sought care after experiencing problems. Commonly cited reasons include: lack of perceived need (44.6%), money (21.4%), or time (11.6%). After adjustment for age, gender, and ethnicity, participating in screening programmes (OR=3.91, 95%CI 1.18-13.68) and awareness of income-based subsidies (OR=2.5, 95%CI 1.10-5.82) predicted better oral health. Better financial coping ability was associated with increased eating rate (OR=3.2, 95%CI 1.41-7.46) and decreased chewing difficulty (OR=0.30, 95%CI 0.13-0.69). Having a regular general practitioner lowered

odds of chewing difficulty (OR=0.46, 95%CI 0.22-0.94). Increased dental visit frequency was predicted by enrolment with a general practitioner (OR=2.42, 95%CI 1.09-5.47), and use of income-based (OR=2.70, 95%CI 1.36-5.47) or age-based (OR=2.9, 95%CI 1.36-6.33) subsidies.

Discussion: Participants experienced substantial oral health and functional burden. The frequency of dental visits was lower than national averages, possibly due to greater socio-economic barriers or lack of oral health literacy. Mediators explaining the link between financial capacity and oral function should be explored. Better oral health, function and care-seeking were linked to broader health-seeking behaviours and healthcare system engagement.

Conclusion: Oral health equity and dental care utilisation may be improved by reducing financial barriers, education and preventive frameworks enabling sustained healthcare engagement.

ID 1652- Association of health literacy with fruit and vegetable consumption among university students of health sciences in Kosovo.

Naim JERLIU [(1)] , Haxhi KAMBERI [(2)], Pranvera KRASNIQI [(3)], Arlinda JETISHI [(3)], Albana MORINA [(4)]

(1) Medical Faculty, University Of Prishtina, National Institute Of Public Health Of Kosovo, Prishtina, Kosovo
(2) Medical Faculty, University Of Gjakova "fehmi Agani", Gjakova, Kosovo
(3) National Institute Of Public Health Of Kosovo, Prishtina, Kosovo
(4) Main Family Medicine Center In Prishtina; Association Of Family Medicine Doctors Of Kosovo, Prishtina, Kosovo

Context: Health literacy (HL) is considered an important determinant of dietary behaviors, influencing fruit and vegetable intake among young adults. However, the evidence on the association between HL and dietary behaviors remains scarce in the Western Balkans.

Objectives: We assessed the association of HL with fruit and vegetable consumption among university students in Kosovo.

Methods: A cross-sectional study was carried out in 2024, including 470 students of health sciences (≈86% females; mean age: 20.7±2.7 years; response rate: 70%). HL was measured by using the European Health Literacy Survey Questionnaire (HLS-EU-Q). HL scores ranged from 0 (lowest general HL level) to 50 (highest general HL level), which in the analysis were dichotomized into “inadequate and/or problematic HL” (scores: 0-33) to “sufficient and/or excellent HL” (scores: 34-50), according to the recommendations of developers of the instrument[1]. Additionally, information on fruit and vegetable consumption and sociodemographic factors was collected. Binary logistic regression was used to assess the association of HL with fruit and vegetable consumption. [1] Holt KA, et al. Health literacy, digital literacy and eHealth literacy in Danish nursing students at entry and graduate level: a cross-sectional study. BMC Nurs. 2020;19:22.

Results: Daily consumption of fruit was ≈47% among students with “sufficient and/or excellent HL” levels compared with ≈33% in those with “inadequate and/or problematic HL” levels. Similarly, daily consumption of vegetables was higher among students with “sufficient and/or excellent HL” levels than in those with “inadequate and/or problematic HL” levels (≈45% vs. 36%, respectively). In logistic regression models adjusted for gender, age and family income of participants, the odds of non-daily consumption were 56% higher for fruits and 32% higher for vegetables among students with “inadequate and/or problematic HL” compared with their counterparts with “sufficient and/or excellent HL” levels.

Discussion: HL was positively associated with daily fruit and vegetable consumption, highlighting the need for targeted interventions to strengthen HL and promote healthier dietary behaviors in the region.

Conclusion: Strengthening health literacy may have both immediate benefits for individual health behaviors and longer-term implications for public health practice. Integrating health literacy–oriented nutrition education within university settings could support healthier eating habits and contribute to non-communicable disease prevention.

ID 1312- Primary care for people with intellectual disabilities; what do doctors and patient need?

Monique KOKS-LEENSEN, Katrien POULS, Milou VAN DEN BEMD, Bianca SCHALK, Mathilde MASTEBROEK, Maarten CUYPERS

1 Radboud University Medical Center, Department Of Primary And Community Care, Nijmegen, The Netherlands; 2 Academic Collaborative Intellectual Disability And Health-Sterker Op Eigen Benen, Nijmegen, The Netherlands, Nijmegen, Pays-Bas

Context: For people with a mild intellectual disability (ID), their general practitioner (GP) plays a pivotal role as this are often the first point of contact in care. They experience higher rates of mental and chronic health problems, and often have different care needs and visit their GP more often than patients from the general population. GPs on the other hand struggle to provide and organize appropriate care for this patient group.

Objectives: Improving accessibility and quality of primary care requires insight into needs and expectations of both patients with ID and GPs providing care to this vulnerable group. In this presentation we identify overarching needs and expectations from both perspectives within the Dutch primary care context, as well as opportunities for improvement.

Methods: This presentation synthesizes findings from multiple qualitative studies exploring the perspectives of patients with ID, as well as primary healthcare providers. Data sources include semi-structured interviews with patients with MID and mental health problems (n=11), focus groups with GPs and mental health nurse practitioners (n=19), and interviews with patients (n=14) and providers (n=32) on chronic disease management.

Results: Findings indicate that the combination of ID and co-occurring mental or chronic health conditions increase demands on primary care: patients often feel (extra) vulnerable and GPs experience consultations as particularly complex. This complexity brings specific needs that emerged across this studies: (1) building a strong, trust-based relationship supported by adapted communication; (2) involving formal and informal networks, which play pivotal yet inconsistent roles in care access and follow-up; (3) coordinating care across various providers and (fragmented) settings; and (4) providing practical support and accessible information to enable self-management while safeguarding autonomy.

Discussion: These findings highlight opportunities to improve quality and equity in primary care, which require investments in GP training and care organisation as well.

Conclusion: Patients with mild intellectual disability face complex health needs, requiring trustful communication, network involvement, and coordinated care. Strengthening GP training, continuity, and integrated pathways is essential to improve equity and quality in primary care.

ID 86- Focusgroup study to explain differences in primary care between older migrants and non-migrants with dementia or diabetes in the Netherlands

Bianca STROOIJ [(1)] , Marieke BLOM [(1)], Jos VAN CAMPEN [(2)], Irene VAN VALKENGOED [(3)], Petra ELDERS [(1)], Karlijn JOLING [(4)], Hein VAN HOUT [(1)], Otto MAARSINGH [(1)], Maaike MUNTINGA [(5)]

(1) Amsterdam Umc, Department Of General Practice, Amsterdam, Pays-Bas
(2) Department Of Geriatrics, Olvg Hospital, Amsterdam, Pays-Bas
(3) Amsterdam Umc, Department Of Public And Occupational Health, Amsterdam, Pays-Bas
(4) Amsterdam Umc, Department Of Medicine For Older People, Amsterdam, Pays-Bas
(5) Amsterdam Umc, Department Of Ethics Law And Humanities, Amsterdam, Pays-Bas

Context: Migrants in Europe are known to experience poorer health as they age compared to native populations. They are more likely to develop chronic diseases, such as dementia and type 2 diabetes, and at a younger age compared to non-migrants. These conditions require long-term (medical care), which in the Netherlands is primarily provided by general practitioners (GPs). However, barriers to access and quality of care persist for migrant groups. We previously identified differences

in primary care for older adults with dementia or diabetes between migrants and non-migrants in the Netherlands, specifically in fewer GP home visits and more use of out-of-hours GP services. The reasons for these differences remain unclear.

Objectives: This study aims to explain the previously observed differences and to identify opportunities to improve GP care for older migrants with dementia or diabetes in the Netherlands, in collaboration with relevant stakeholders.

Methods: We are conducting an exploratory qualitative study using focus group discussions with informal caregivers, patient representatives, and GPs. During the focus groups, we present the observed differences and invite participants to share possible explanations based on their personal experiences. Additionally, we explore suggestions for improving GP care. The discussions will be analysed using thematic analysis, without a pre-existing coding framework.

Results: Preliminary results The first focus group was held with eight informal caregivers of older adults with dementia or diabetes of Moroccan origin. Important topics that emerged included Language & communication barriers, Navigating the (healthcare) system, Dignity & autonomy, Expectations of care, and (Felt) stigma. Further focus groups are planned to be conducted in the near future.

Discussion: Although this is an exploratory study with a small sample size, it addresses a previously under-researched topic. The combination of quantitative and qualitative approaches strengthens this study.

Conclusion: We expect the findings of this study to help design interventions to improve the GP care for older migrants with dementia or diabetes.

ID 2118- Innovative postgraduate training for primary care pharmacists: workplace-based learning in general practice

Ankie HAZEN [1], Josephine MERTENS-STUTTERHEIM [2], Valérie MEIJVIS [3], Mirjam WAGENVOORT [1], Roger DAMOISEAUX [1], Dorien ZWART [1]

(1) Julius Center For Health Sciences And Primary Care, Department Of General Practice & Nursing Science, University Medical Center Utrecht, Utrecht University, Utrecht, Pays-Bas
(2) Department Of Clinical Pharmacy And Toxicology, Leiden University Medical Center, Leiden, Pays-Bas
(3) Leidsche Rijn Julius Health Center, Utrecht, Pays-Bas

Context: The increasing complexity of pharmacotherapy calls for an expanded role for pharmacists in primary care. General practice-based pharmacists can improve care quality, reduce medication errors, and prevent hospital admissions. This evolving role requires further development of clinical, communicative, and interprofessional competencies.

Methods: A multidisciplinary team of pharmacists, general practitioners (GPs), educational scientists, and a psychologist developed a one-year postgraduate training program for general practice-based pharmacists in the Netherlands. The program is organised around five learning pathways: (1) consultation skills; (2) clinical decision-making; (3) interprofessional collaboration; (4) professional practice and positioning; and (5) quality improvement. The program includes 20 teaching days, combining workplace-based learning in general practice with interactive small-group education, partly delivered with GPs. Educational principles include competency-based and self-directed learning. Participants completed online evaluations after each teaching day.

Originality: This is the first structured postgraduate training program in the Netherlands specifically designed to prepare pharmacists for a clinical role in general practice.

Lessons learned and future implication: The program was developed in 2024 with active stakeholder involvement. In January 2025, twelve pharmacists working part-time in general practice started the program. A total of 139 evaluations of teaching days and 51 evaluations of joint GP sessions were

Discussion: This training program supports the implementation of general practice-based pharmacists. By integrating self-directed and

interprofessional learning, it bridges the gap between existing pharmaceutical education and the growing demand for patient-centred, multidisciplinary primary care.

Conclusion: A competency-based postgraduate training program integrating workplace learning and interprofessional education effectively prepares pharmacists for an expanded clinical role in general practice.

(4) 1: Chu Rennes, Inserm Cic 1414, Rennes, 35000, France, 2: Department Of Public Health, Pontchaillou Hospital, University Hospital, 35033 Rennes, France. 3: Chu Rennes , Univ Rennes, Inserm, Ehesp, Irset, Umr_s 1085, F-35000, Rennes, France, Rennes, France
(5) Leps (laboratory Educations And Health Promotion), University Of Sorbonne Paris Nord, Ur 3412, Villetaneuse, F-93430, France, Villetaneuse, France

Context: In primary care in France, in order to meet the challenge of supporting a growing number of people to self-manage their chronic disease, primary care teams (PCT) are organising themselves to offer self-management intervention (SMI), sometimes supported by a support structure. These SMI are accessible and personalised, but insufficiently developed to face the needs of the population and not based on SMI models.

Objectives: The objective of the research was to describe a comprehensive model of the organisational, psycho-cognitive and educational aspects that favour the design of a SMI, carried out by PCTs in France.

Methods: We used a mixed explanatory method, consisting of an initial questionnaire survey of regional health agency project managers, which enabled us to describe 127 SMI carried out in PCTs between 2010 and 2022. Based on these SMI, we then conducted a second qualitative phase, consisting of an initial sequence carried out using a template analysis with eight PCT- support structure pairs and a second sequence carried out using grounded theory analysis with 17 members of PCT educational teams.

Results: The educational team (composed of healthcare professionals and patient partners) is at the heart of our model, led by leadership and supported by coordination. The educational team works with 1) the PCT, which incubates the dynamic within its organisation, 2) a network of partners, which supports the SMI, 3) a restrictive healthcare system, which influences practices, 4) a coordinated and complex educational action, including the organisational and educational coordination of the SMI. Cross-cutting categories, spanning the other categories, are identified, such as 5) the values of the actors, which are more or less conscious, and 6) SMI practices that transform both the actors and healthcare practices.

Discussion: The model presented demonstrates both the feasibility of designing a SMI in PCTs and describes relevant strategies to support their deployment. A complementary theoretical analysis of the model (particularly educational) will enable an intervention model to be proposed for testing in PCTs.

Conclusion: In a context of more and more people presenting chronic disease, our comprehensive model can help the healthcare system to better adapt their care to the real needs of patient.

ID 1593- "We Are Doing Research": Epistemic Subjectivation in a Multiprofessional Primary Care Team

Vanessa PALMA [(1)] , Coralie LOUBARESSE [(2)]

(1) Université De La Réunion, La Possession, Réunion
(2) Université De La Réunion, Saint-André, Réunion

Context: In France, multiprofessional primary care research remains underdeveloped. Multiprofessional primary care group practices (MSPs) conduct protocols akin to action research, but these are rarely recognised as forms of knowledge production. Little is known about how teams conceptualise research and how a quality improvement dynamic can reshape these conceptions.

Objectives: To explore how acculturation to research through a quality improvement process reshapes an MSP team's conceptions of research.

Methods: Exploratory qualitative study using a grounded theory approach, conducted in a single MSP with four health professionals (one general practitioner, two nurses, one physiotherapist) and a patient partner, recruited through purposive sampling. It constituted the third phase of a three-step process: initial exploration of representations of research, implementation of a quality improvement initiative, then acculturation to research by drawing an analogy between the team's protocol development and a research process, prior to exploring representations a posteriori.

Results: Three dynamic processes emerged: (1) the foundations of a learning community (shared leadership, a collective desire for improvement, pragmatic responsiveness); (2) epistemic subjectivation, with an emotionally charged realisation that "we are doing research" and the legitimisation of a stance as producers of knowledge; (3) the emergence of an inductive, situated, multiprofessional research model positioning the MSP as a third space for research, articulating care, training and knowledge production. Structural barriers persist (time, tools and infrastructure, institutional recognition).

Discussion: These findings are consistent with the principles of community-based participatory research and practice-based research networks, showing that knowledge production can be co-constructed from situated forms of knowing. Recognising the epistemic competencies of the professionals and the patient partner may help reduce structural epistemic injustice towards primary care teams and their patients.

Conclusion: The quality improvement process, supported by a protected reflexive space, fostered acculturation to research and a shift towards a form of research that is situated, democratic and team-led. These findings suggest that MSPs can become third spaces for primary care research, provided that a safe framework and methodological support are recognised as genuine epistemic requirements.

ID 1447- Strengthening nurse-physician interprofessional collaboration in general practice: A multimodal intervention study

Karen VAN DEN BUSSCHE, Vanessa GAUWE

Arteveldehogeschool, Ghent, Belgique

Context: General practitioners (GPs) increasingly collaborate with nurses to address rising workload pressures, ageing populations and multimorbidity. However, practices vary widely in how collaboration between nurses and general practitioners is organised and supported. Within the XXX-project, the eight participating practices reported challenges in developing the nurse's role into a complementary function within an interdisciplinary team, highlighting the need for targeted support to strengthen collaborative practice. A multimodal intervention was therefore developed in co-creation to enhance nurse-physician collaboration and strengthen team functioning in GP.

Objectives: To evaluate the impact of a multimodal intervention on (1) quality of chronic care organisation, (2) work system characteristics based on the SEIPS framework, including (3) the role and task profile of the nurses within the GP, and (4) implementation-related variables.

Methods: The intervention was delivered from June 2025 to May 2026 in 8 general practices with at least one nurse on staff. It consisted of: (1) five

workshops for nurse–physician dyads on protocol-based care; (2) four online intervision sessions for nurses to support peer learning; (3) three in-practice coaching sessions tailored to the needs of the GP, and (4) optional learning resources comprising tools on the role of the nurse, vision and mission development, and leadership workshops. A pre–post design was used to assess changes in the quality of chronic care organization, SEIPS work system domains (persons, tasks, tools/technology, organisation, internal and external environment), and implementation outcomes. Data were collected through surveys, structured observations, and focus groups.

Results: Final results will be available at the conference. Preliminary feedback suggests improved role clarity, more structured nurse–physician communication and expanding protocol-based care.

Discussion: Early indications show that a multimodal approach combining shared learning, peer reflection, and coaching can meet diverse practice needs in expanding the role of nurses in GP.

Conclusion: This study examines a multimodal intervention to strengthen nurse–physician collaboration in GP. Findings are expected to guide future strategies to support collaborative primary care teams.

ID 712- Professionals with a Voice: Quality emerges from recognition and active listening

Santiago CARDAMA, Lucia PÉREZ, Lucía BERMEJO, Nuria PORTUGUES, Manuel TORRES, Jorge ÁVILA, Belén PERALES

Cs Isla De Oza, Madrid, Espagne

Context: Healthcare transformation cannot be achieved without acknowledging those who sustain care delivery: professionals. Despite technological and organizational progress, care quality still depends on human factors such as recognition, motivation, participation, and team cohesion. Actively listening to professionals, highlighting strengths, and integrating their perspective in decisions improves the work environment and patient experience. Empowering caregivers is an internal improvement strategy with measurable organizational impact.

Objectives: This study explores how recognizing the individual value of healthcare professionals positively influences motivation, engagement, and performance. It aims to demonstrate that such recognition combined with institutional active listening enhances team well-being, strengthens organizational culture, and contributes to safer, efficient, and patient-centered care models. We emphasize the relevance of supportive work environments where professionals feel valued, respected, and heard, as this directly correlates with care quality.

Methods: A qualitative approach was conducted using clinical and managerial experience, incorporating interventions focused on internal recognition, multidisciplinary communication, and participatory leadership. Data collection included direct observation, structured interviews, and reflective group sessions, allowing the integration of diverse professional perspectives within healthcare settings.

Results: Findings showed improvements in professional satisfaction, inter-team coordination, and commitment. Explicit recognition, opportunity to express ideas and concerns, and valuing individual strengths reinforced ownership and perceived contribution. Indirect improvements included reduction of conflict, lower turnover, and enhanced adaptability to organizational change. Participants reported higher alignment with institutional objectives and greater connection with professional purpose.

Discussion: The organizational interventions implemented have shown a significant impact on professional satisfaction and team coordination. Explicit recognition of well-done work, the creation of safe spaces to express ideas and concerns, as well as the appreciation of individual strengths, have proven to be strategies that strengthen professional commitment and improve patients' perception of quality.

Conclusion: Professionals with a voice strengthen institutional resilience, safety culture, and leadership capacity. Active listening and recognition are fundamental components of quality

improvement. Healthcare transformation must begin internally by caring for and valuing those who care, promoting safe communication spaces, and prioritizing human development as a strategic pillar. Supporting empowered teams represents an investment in safer and effective patient care.

ID 762- Embedding adapted physical activity within a primary care learning model: an interprofessional community-based experiment

Anna BARAN

Mspu Corneille, Wattrelos, France

Context: Adapted Physical Activity (APA) is recognised in France as an effective non-pharmacological therapy. However, its implementation in primary care remains limited due to insufficient training of general practitioners, low visibility of APA professionals, and weak coordination between health and sport sectors. To address these barriers, a primary care centre and a university faculty jointly developed an interprofessional model integrating APA student internships within routine primary care.

Methods: In October 2024, the University of XXX Faculty of Health and Sport Sciences partnered with a university-affiliated Maison de Santé Pluriprofessionnelle Universitaire (MSPU) in XXX. The initiative embedded APA Master's students within the primary care team, alongside general practice trainees, under shared academic supervision. APA students delivered individualised APA programmes and facilitated a supervised walking group. In 2024–2025, two students supported 45 patients. In 2025–2026, five students participated, and by October 2025, 83 patients had joined APA activities.

Originality: While APA is increasingly promoted in France, few initiatives embed APA professionals directly within primary care teams and even fewer integrate them into a formal learning environment combining medicine and sport sciences. This model differs from existi

Lessons learned and future implication: Key lessons include the value of co-location for improving communication, the need for clear supervision roles, and the importance of early integration of APA students into team routines. The experience highlights the potential for replicating such models

Discussion: This case suggests that embedding APA within primary care strengthens interprofessional collaboration, enhances preventive practices, and supports experiential learning. However, ongoing evaluation is required to assess long-term impact and ensure scalability.

Conclusion: Integrating APA internships into a community-based primary care centre expands patient access to evidence-based physical activity programmes, strengthens interprofessional education, and offers a promising model for enhancing preventive care capacity in primary care.

ID 466- Multidimensional analysis of organizational structures in XXX general practices: team model, patient flow and digital integration

Liena GASIŅA, Sabīne MORA-MIEZE, Laura KLINTSONE, Ilze GROPE

Riga Stradiņš University, Riga, Lettonie

Context: XXX faces persistent structural challenges in primary care, including fragmented practice organization, limited delegation, high administrative burden, and high hospitalization rates for ambulatory care–sensitive conditions. Although international evidence demonstrates that well-structured, team-based general practice improves access and reduces avoidable hospitalizations, the real-life organizational functioning of XXX general practices has not been systematically evaluated.

Objectives: To examine the organizational structures of XXX general practices—focusing on team composition, patient flow management, and digital care processes—and to contextualize findings

within broader patterns described in XXX primary care literature.

Methods: A mixed-methods descriptive study was conducted in 120 general practices across XXX. Quantitative data were collected through a questionnaire assessing staffing models, division of tasks, appointment organisation, telephone accessibility, acute care pathways and digital tool use. Qualitative data were gathered from semi-structured interviews with family physicians, nurses and administrative staff. In addition, published sources, including policy documents, national reports and peer-reviewed studies on XXX primary care organisation, were reviewed to support contextual interpretation. Quantitative data will undergo descriptive statistical analysis; qualitative material will be thematically analysed and findings integrated using triangulation.

Results: Preliminary patterns indicate considerable variability across practices. Many operate with minimal staffing and limited task delegation, contributing to high administrative load. Practices with both a nurse and an administrator involved in patient flow tend to demonstrate shorter waiting times and better accessibility. Acute care organization and telephone management vary widely, with some practices relying on ad hoc arrangements. Digital care is inconsistently implemented: telephone consultations are common, while electronic communication, online booking systems, and protocol-driven remote management remain limited. Thematic analysis is expected to reveal recurring challenges such as documentation overload, fragmented workflows, and insufficient integration of team roles.

Discussion: Early findings suggest that XXX's practice organization differs from structures described in other XXX states, where more standardized workflows, broader team roles, and higher levels of digital integration are commonly reported. These contrasts highlight potential areas for system-level strengthening.

Conclusion: This study provides the first multidimensional mapping of organizational structures in XXX general practice, highlighting priority areas for improvement—team expansion, structured patient flow, and consistent digital integration—and offering an evidence-based foundation for strengthening primary care in XXX.

Telehealth

ID 1095- The Patient Journey Record (PaJR). A telehealth patient journey coaching system operating since 2018

Carmel MARTIN [(1)] , Donald CAMPBELL [(1)], Keith STOCKMAN [(2)], Narelle HINKLEY [(2)]

(1) Monash University, Clayton, Australie
(2) Hospital Without Walls, Clayton, Australie

Context: The Patient Journey Record System (PaJR) was conceptualised and designed by general practitioners (GP), in the out-of-hours setting in Ireland, to improve the journey care of vulnerable, ill or frail patients who attended or who had home visits in 2010. It was a telehealth service, that is disease agnostic, with lay navigators making regular phonecalls to patients identified as being at risk of emergency department visits or acute admissions. The PaJR system has been operational in Victoria, Australia since 2018.

Methods: This abstract outlines the conceptual evolution, development, and practical implementation of the PaJR system, summarising findings from trials and evaluations across diverse healthcare contexts. Evaluation methods included pragmatic controlled trials, service reviews, and case vignettes, with outcomes such as hospital utilisation and patient satisfaction.

Originality: The system’s originality lies in recognising that “patients know their health and can anticipate worsening health,” and that generic GP care avert acute care if alerted. PaJR phone interventions use conversational analysis on self-reported patient narrati

Lessons learned and future implication: Lessons highlight the value of relational care, narrative data, and localised GP care in patient journeys. Key challenges included integrating with changing health systems and ensuring sustainable resources. Broader adoption enabled by digital platform sc

Discussion: Future enhancements involve artificial intelligence for voice metrics for improved risk prediction and triage, while maintaining the essential human element in care. Sustainable adoption requires supportive policy, funding, and ongoing workforce development, with further research needed to guide best practice.

Conclusion: The PaJR system integrates structured telehealth conversations, predictive alerts, and relational coaching to support early detection of deterioration and adaptive care planning. Across multiple deployments, PaJR has demonstrated reductions in inpatient bed-days, improved care coordination, and high patient satisfaction. The synthesis highlights both the promise and challenges of implementing anticipatory, human-centred care models in real-world systems.

ID 840- Evaluating the Impact of Telehealth Intervention Combined with Continuous Glucose Monitoring on Glycemic Control in Individuals with Prediabetes

Zhen-Yi CHEN

Taipei Municipal Wanfang Hospital, Taipei, Taïwan, République de Chine

Context: Prediabetes significantly increases the risk of diabetes, cardiovascular diseases, and mortality. In XXX, the prevalence is around 29.6%. The primary management approach is lifestyle modification, yet the best method for sustainable change is debated. During the pandemic, continuous glucose monitoring and telehealth have shown promise for diabetes management, especially for insulin users. However, their application for prediabetes remains under-researched.

Objectives: Evaluate the efficacy of remote education with continuous glucose monitoring versus traditional in-person lifestyle education in managing prediabetes.

Methods: In this single-center, randomized controlled study, participants diagnosed with prediabetes are recruited and divided into two groups. Following screening and consent, participants are either assigned to a control group, which receives two in-person education sessions, or an experimental group, equipped with a 14-day continuous glucose monitor and two remote sessions. Post- intervention evaluations at 3 and 6 months measure fasting glucose and BMI. Any adverse events are closely monitored. Data analysis is conducted using ANOVA in STATA, focusing on the effects of interventions over time and across groups, with post-hoc tests and Bonferroni adjustments applied as needed.

Results: At six months, 26 participants completed follow-up. Compared with the control group, the CGM group demonstrated greater improvements in glycemic outcomes, including non-significant trends toward reductions in HbA1c and fasting glucose. BMI showed a modest downward trend in the CGM group, although between-group differences were not statistically significant. No serious adverse events occurred, and CGM-related skin irritation was mild and self-limited.

Discussion: The findings suggest that integrating short-term CGM use with remote education provides measurable benefits for individuals with prediabetes, surpassing traditional in-person education. Continuous visual feedback from CGM may enhance self-awareness of dietary, facilitating more sustained metabolic improvements. The observed enhancements in glycemic regulation and quality of life align with emerging evidence supporting CGM as a behavioral intervention tool. However, the modest sample size and single-center design may limit generalizability.

Conclusion: A brief CGM-supported intervention combined with remote counseling appears feasible, safe, and more effective than standard education in improving glycemic outcomes among adults with prediabetes. These results highlight the potential of CGM-guided lifestyle modification as an early preventive strategy and warrant further evaluation in larger, long-term studies.

ID 1096- A Human Factors Study Examining Virtual Care between GPs and

Aged Care Homes: Using Systems Engineering Approaches to Improve Adoption

Meredith MAKEHAM [1] , Tamasha Dilani JAYAWARDENA [2], Melissa BAYSARI [2], Fiona ROBINSON [3], Susan KURRLE [4], Pan TENG [5], Adeola BAMGBOJE-AYODELE [6]

(1) Faculty Of Medicine And Health, University Of Sydney, Sydney, Australie
(2) Digital Health Human Factors Research Group, Faculty Of Medicine And Health, University Of Sydney, Sydney, Australie
(3) General Practice Clinical School, Faculty Of Medicine And Health, University Of Sydney, Sydney, Australie
(4) Northern Clinical School, Faculty Of Medicine And Health, University Of Sydney, Sydney, Australie
(5) Sydney North Health Network, Sydney, Australie
(6) Discipline Of Design, School Of Architecture, Design And Planning, The University Of Sydney, Sydney, Australie

Context: Virtual care is expected to improve access to general practice for people in residential aged care homes (RACHs), yet uptake remains slow as pressures on primary care intensify. A central challenge in many countries is how GPs and RACHs can implement virtual care sustainably and equitably. A systems engineering approach was used to examine barriers to virtual care for residents in RACHs with general practice, offering insights into why adoption has struggled despite clear clinical need.

Objectives: To identify work system factors influencing safe and effective virtual care in RACHs and outline improvements that could support general practice workflows.

Methods: Semi-structured interviews were conducted with thirty two participants, including eleven GPs, eleven registered nurses, three practice managers, five residents and two carers. Analysis followed the Systems Engineering Initiative for Patient Safety model to examine interactions across people, tasks, technologies, environments and organisational processes.

Results: Coordination problems were a significant barrier. Staff availability rarely aligned with GP schedules, and misaligned workflows meant residents, devices and essential information were not ready together, leading to delays. Communication limitations related to hearing loss, visual impairment, cognitive decline and language differences with residents reduced assessment quality. Technology issues including weak connectivity, systems learnability and minimal integration disrupted workflow. High staff turnover, limited device access and duplicating documentation added to workload. Environmental pressures including noise, privacy constraints and unclear funding rules created further strain. Facilitators included access to vital signs before consultations, combined GP/RACH training, reliable access to clinical information systems and dedicated devices in homes.

Discussion: Workflow barriers restrict routine use, and existing guidance does not reflect the pressures clinicians face. Evidence using systems engineering principles remains limited, although this approach provides a structured way to understand how technology functions in complex environments.

Conclusion: Virtual care remains difficult to embed within general practice and aged care home workflows. This systems engineering analysis using human factors methods explains the adoption gap, and identifies actions to support reliable and efficient care. Improved coordination processes, stronger workflow alignment, reduced documentation load and access to reliable devices offer a path toward sustainable and equitable virtual care with GPs for people in aged care homes.

ID 695- Institutional perspectives on telemedicine development: insights from 2025 key informant survey

Tamar GABUNIA [1], Ekaterine TIKARADZE [2] , Irine KAROSANIDZE [1]

(1) National Family Medicine Training Center, Tbilisi, Géorgie
(2) Family Medicine Association, Tbilisi, Géorgie

Context: XXXX has rapidly advanced its digital health agenda, with telemedicine becoming a strategic tool for improving access to care in remote and underserved regions. Rural PHC settings have been central targets of these reforms. Since 2021, 110 rural ambulatories have been equipped with

telemedicine capabilities, enabling remote consultations, digital diagnostics, and virtual mentoring for frontline providers. Several national actors have supported rural sites through improved connectivity and digitized clinical workflows.

Methods: In November 2025, an online semi-structured survey gathered insights from senior representatives of the XXXX Family Medicine Association, rural primary care providers, and independent experts.. The survey explored organizational roles, motivations for entering telemedicine work, experiences with rural implementation, integration challenges, and perceived outcomes. Many respondents reported the beginning of telemedicine activities during the COVID-19 pandemic, using remote consultations, digital mentoring, and tele-screening initiatives to strengthen rural access. Strengths included high acceptance among rural PHC teams, improved patient reach, and enhanced provider confidence. Limitations included fragmented national coordination, variable infrastructure, and a lack of standardized digital pathways.

Originality: This case report provides one of the first comparative institutional reflections on telemedicine implementation after the COVID-19 period. While earlier literature focuses on small-scale pilots, this experience highlights long-term organizational engageme

Lessons learned and future implication: Key lessons highlight the importance of strong national coordination to ensure coherent and equitable implementation. Telemedicine initiatives must be grounded in the practical needs of the PHC system rather than driven solely by technological possibiliti

Discussion: Institutional perspectives confirm that rural telemedicine success relies on contextual adaptation, strong PHC integration, and clear coordination mechanisms across stakeholders.

Conclusion: Telemedicine deployment across rural settings demonstrates significant potential for improving access and reducing disparities. Scaling these gains will require coordinated national oversight, standardized systems, and sustained investment in PHC workforce capacity.

ID 532- Evaluation of patients' attitudes towards the use of telemedicine services in family medicine outpatient clinic

Kamer Billur YÜCEL ÖZDEN [(1)] , Rana BAYKAN GÜRÜZ [(2)], Hüsna SARICA ÇEVIK [(3)], Mehmet UNGAN [(3)]

(1) Republic Of Türkiye Ministry Of Health Kağızman District Health Administration, Kars, Türkiye
(2) Republic Of Türkiye Ministry Of Health Kocasinan District Health Administration, Kayseri, Türkiye
(3) Department Of Family Medicine, Ankara University School Of Medicine, Ankara, Turkey, Ankara, Türkiye

Context: Primary health care underpins sustainable, resilient health systems; understanding patients' attitudes toward telemedicine services is crucial for enhancing quality and planning.

Objectives: This cross-sectional study examines these attitudes and their influencing factors.

Methods: In the study, a 38-item questionnaire—including questions on demographic characteristics, employment status, health status, healthcare service utilization, and the Attitude Scale Towards the Use of Telemedicine Services—was administered to patients visiting the Family Medicine Outpatient Clinics of Ankara University Hospitals between January and March 2025. The scale yields scores between 18 and 90; higher scores reflect a more positive attitude toward telemedicine use. Normality was assessed visually and statistically; groups were compared via t-test/ANOVA, and age-scale correlation was analyzed using Pearson's test.

Results: A total of 155 patients participated in study, with an average scale score of 58.5±16.7. Scale scores were significantly higher among university and postgraduate graduates (62.6±16.5) compared to high school (55.1±15.9) and below high school graduates (51.1±15.0); among employed individuals (63.9±16.6) compared to unemployed (54.3±15.5), and among full-time workers (66.5±14.5) compared to those with other working arrangements (52.5±20.4). A low negative correlation was found between scale score and age (r=-0.221, p=0.006).

Discussion: In line with prior research, younger age and higher educational attainment were associated

with more favorable attitudes toward telehealth, likely reflecting greater digital literacy and familiarity with technology. Contrary to several studies reporting higher acceptance among patients with chronic conditions, our participants without chronic disease had higher attitude scores, possibly indicating concerns about the adequacy of remote care for complex problems. Higher scores among employed and full-time workers suggest that telehealth is particularly attractive for time-constrained adults. Evaluating these patterns in a tertiary family medicine outpatient clinic adds novel evidence from Turkey to the primary care telehealth literature.

Conclusion: This study demonstrated that attitudes towards telemedicine services are significantly associated with educational level, employment status, and work arrangement. At the same time, the findings offer significant contributions toward developing strategic interventions to enhance the adoption of telemedicine services.

ID 210- A qualitative study on patients' perspectives on barriers to teleconsultation adoption in a primary care clinic in Malaysia

Wen Ting TONG [(1)] , Linn Htet NE YE [(1)], Hooi Chin BEH [(1)], Adina ABDULLAH [(1)], Yew Kong LEE [(1)], Hooi Min LIM [(1)], Chirk Jenn NG [(2)], Nick SEVDALIS [(3)]

(1) Department Of Primary Care Medicine, Faculty Of Medicine, Universiti Malaya, Kuala Lumpur, Malaisie
(2) Centre For Population Health Research And Implementation, Singhealth Regional Health System, Singapore, Singapour
(3) Centre For Behavioural And Implementation Science Interventions (bisi), Yong Loo Lin School Of Medicine, National University Of Singapore,, Singapore, Singapour

Context: Teleconsultation (TC) benefits patients with conditions like diabetes, hypertension, and high cholesterol, offering quality care, aiding patient recall, and saving costs. Yet, its adoption is poor in Malaysia, a developing middle-income country in Southeast Asia.

Objectives: This study explored patients' perspectives on the barriers to using TC in a primary care clinic.

Methods: A qualitative study design was adopted. Individual semi-structured interviews was conducted among 13 patients who have used TC in a primary care clinic, and one who did not. Interviews were guided by an interview guide developed from the Theoretical Domains Framework. Interviews were transcribed verbatim and analysed thematically using an inductive approach.
